A separate fund has been raised by the women of Cornwall to provide for the internal fittings and decoration of the cathedral, including the stained glass and the marble floor, and nearly the whole of the furniture is now in position. The reredos is Early Perpendicular in style, and is divided into three bays, and has as its central subject the "Crucifixion," with a vesica containing a representation of "Our Lord in Glory"; the material is Bath stone, and Mr. Hitch is the sculptor. The side panels will also illustrate scenes in our Lord's Life; but are not yet undertaken. The altar has been painted by Mr. J. R. Clayton; and besides the frontals and the linen, the cross, vases, and candlesticks, there are four new sets of Communion-plate; one is of solid gold, ornamented with *repoussé* work, two others are of silver gilt and jewelled, the fourth contains a remarkable chalice. This has been entirely made up out of jewellery presented for the purpose. The body is of gold, round the bowl is a band of ringstones in their original setting, on the foot is a pearl cross, and the whole is richly decorated with precious stones. Mr. Hart designed this cup, and most of the other plate has been made by his firm (Messrs. Hart, Son, Peard, and Co.), from Mr. Pearson's designs; but the altar cross in silver gilt, studded with jewels and with embossed figures on the four limbs, is, as we mentioned last week, the work of Messrs. Cox, Sons, Buckley, and Co., who have also executed the festal frontal and other hangings. The upholstery work throughout has been executed by Messrs. Criddle and Smith, of Truro.

The side screens of the choir are of light hammered iron. The stalls are of teak and in the Perpendicular style. There are no return stalls, nor at present any canopies over the stalls, though the lower part of the vaulting shafts has been cut away in the usual manner to provide for them. The Bishop's throne is made in Burmese teak, and has a bishop's seat in centre, and chaplain's seats on either side. Beneath the book front in the centre are three canopied and crocketed niches in which are placed figures of the present Archbishop of Canterbury and the Bishops of London and Truro (Drs. Benson, Temple, and Wilkinson), each sculptured out of the solid. On the divisional ends of the book-fronts are figures of the Four Doctors of the Church. The seats are misereres, and are divided into stalls, while above each is a carved and groined canopy, the bishop's being supported by clustered columns. The work has been executed by Messrs. E. L. Luscombe and Son, of Exeter. The organ is placed over the north aisle, and is at present unprovided with an organ case. The pulpit is circular, overhanging a square base. Its principal adornment consists in six figures seated under canopies, sculptured by Mr. T. Nicholls in Hopton Wood stone. The steps in the choir are of pavonazzetto and Frosterley marble; the floor itself is mosaic, with Egyptian porphyry, green African and other marbles laid in circles, and circular scrolls upon a groundwork of buff Jura marble. Outside the choir the floor is composed of minute pieces of marble laid in concrete; simple patterns in red and green are formed in each bay upon a ground which is almost white. There is a good deal of stained glass by Messrs. Clayton and Bell. The three great lancets in two tiers at the east end are filled with glass of a very blue tone, but the lower tier is almost entirely hidden by the reredos. The principal subject over the altar is Our Lord in Glory. In the two great roses in the transepts are a Jesse tree and the Twelve Apostles. The baptistery windows are also filled with painted glass, and those at the end of the choir aisles; and there is some old stained glass in St. Mary's aisle.

The actual cost of the fabric has been £74,000, but the purchase of the site, legal, and other expenses, have raised the total expenditure of the committee thus far to £95,000, besides £15,000 received for and spent upon fittings. Of the entire outlay of £110,000, about £8,000 has yet to be raised. In the earlier stages of the work, the late Mr. James Bubb acted both as clerk of works and builder; but when the crypt was finished, and the responsibilities grew too great for one man's shoulders to bear, Messrs. John Shillitoe and Son, of Bury St. Edmund's, were appointed builders. On Mr. Bubb's sudden death in May, 1882, Mr. Robert Swain, who had also long been with Mr. Pearson, succeeded him as clerk of works, and in that capacity has shown the deepest interest in the progress of the work, one of his most recent proofs of which is his successful personal appeal in the columns of the daily and professional press for funds to enable the central tower to be carried above the roof-lines.

INFLUENCE OF THE PRE-RAPHAELITE SCHOOL ON BRITISH ART.

A LECTURE on this subject was delivered at the Royal Institution, Manchester, on Friday, by Professor Baldwin Brown, who said the question "What have the pre-Raphaelites done for British painting?" would confront every future historian and critic. Any attempt to find an answer would be based in a large measure on the results of the Exhibitions held in the city of Manchester in 1857 and 1887. On the first of these occasions there was displayed not only a magnificent series of ancient masterpieces such as no other land could boast, but also a representative collection of our national art, covering the first two great periods of its history, the periods dominated by the names of Reynolds and Turner. At present there was exhibited on the walls at Old Trafford the painting of the Victorian era, displayed in a nearly complete series of standard works in all branches of the art. The period covered by the present Exhibition was, from the point of view of the history of painting, an artificial one, as the commencement of the present reign did not mark any natural division in the annals of our art. The year 1850 would probably be the best point of division between the old and the new art, and would mark fairly well the era at which the style of painting most prominent here in 1887 began to show its difference from that prevailing in the earlier collection of thirty years ago. The secret of the difference would be found in the words "tradition" and "naturalism." In the earlier period the power over our art of artistic tradition was very great; in the present epoch tradition could hardly be said to exercise any influence at all, and "independence" was the motto of the school. The productions of the older generation of painters

contained a certain power of generalisation, a certain "style" which they borrowed from the traditions of the past. All must have been struck with the independence of the modern works of art. They were independent one of another, and independent of the past. In their company the student of art history found himself in a brand-new artistic world which had little or no concern with what had gone before. On every side they saw fresh efforts in new directions, combined with a frank disregard of what was once artistic orthodoxy. The pre-Raphaelite movement coincided in time with the epoch of this transformation in the character of our art, and was a movement possessing no little force and persistence, and capable of exercising a marked influence in its time. It would, however, be rash to conclude that British art since 1850 had been made what it was by reason of pre-Raphaelitism. The naturalistic movement of the last 40 or 50 years was a wide-reaching movement, and had in different measures influenced all European schools alike. It was a significant fact, and explained much in the pre-Raphaelite movement, that it was not purely artistic, but was in a large measure a literary movement. The works of members of the school in very many cases were graphic illustrations of some theme which had presented itself to the painter's mind as an intellectual product, a thought which could be conveyed in words as well as through the medium of graphic design. There was so much symbolism in the accessories in pre-Raphaelite pictures; so many details were introduced which had a recondite connection one with another; they had so much work to do in hunting out and appreciating the different subtle relations of this to that, that they lost the artistic impression of the work as a whole. The pre-Raphaelite school had influenced to a marked extent the landscape painting of our time, for the painters of the modern school, whose work in landscape came home to us with sympathetic charm, were the men who had played with Nature as with a familiar friend, till they had learned her every mood. These men gave us what we really needed from art, the more remote and general truth. Combining style and poetical conception with an intimate study of natural forms, they had enriched the world with a series of master works, and in so doing had enlarged our view and deepened our knowledge both of art and nature. Compared with their massive and serious productions, the works of our modern landscapists seemed but slight studies, wanting both in artistic breadth and in idea. Under the inspirations of the pre-Raphaelites, and partly of Mr. Ruskin, an immense amount of careful foreground work and of conscientious rendering of somewhat insipid themes had been accomplished in landscape without the production as yet of any result of lasting value. Such studies had undoubted freshness and charm; but it needed something more to make a great picture. The art of 1887 differed from the art of 1857 and the half century previous in its striking naturalism and its independence of all tradition. In this difference there was involved a conflict of artistic principles. On the one side there was the principle of pre-Raphaelite realism, and on the other the view of art in its relation to nature which could be gathered from the practice and also from the letters and conversations of artists like Constable and Jean François Millet. They might assure themselves that there must be truth on both sides. If the work of the pre-Raphaelites, like the work of modern naturalists as a whole, was to be regarded as marking a genuine effort in the direction of good art rather than as a result in which to remain satisfied, they were not denying that in its time it performed valuable service. The need for some movement of the kind was urgent. Though the older art had great merits, it also had characteristic shortcomings, and about 1850 these were decidedly gaining the upper hand. The masters of the first rank in that period — Flaxman, Constable, Wilkie, Turner — passed away in the order named between 1826 and 1852. The painters of the second rank, too numerous to mention, but of whom David Cox might be taken as a representative, with all their varied excellences had a common defect — they tended towards mannerisms of various kinds. Below these genuine masters again there gathered a crowd of spiritless imitators, and finally came the connoisseurs, critics, and dealers who patronised their style of art. At the present time, whatever might be the shortcomings of our art, we had entirely banished from our walls and exhibitions both these spurious old masters, and also the miserable modern canvases, varnished to the colour of an old Cremona fiddle, which used to be turned out in imitation thereof. We had also succeeded to a great extent in banishing "mannerism" from the catalogue of our artistic sins. Whatever else our artists may be they were fresh, vigorous, independent, lovers of novelty, and unhampered by academic tradition. For this wholesome change we were in a substantial measure indebted to the pre-Raphaelites. They had not the work alone. We owed much, for example, to the principles followed with such brilliant success by the painters of Scotland. But beyond the service they rendered at the moment, or any actual achievement of which they were capable, there remained as their permanent contribution to the life of the Victorian age the noble unselfishness of their lives and their steadfast devotion, through good and evil report, to the work they believed themselves commissioned to perform.

"BUILDING NEWS" DESIGNING CLUB, 1887-8.

THE following are the rules of the club for the present session, giving exact particulars of all that is to be observed by members, it being clearly understood that the club is open to all readers of the BUILDING NEWS. The first list of subjects follows here, and others will be published on the first Friday of each month. Correspondents are requested to look for all notices intended for members of the club under the heading of Answers to Correspondents; and we cannot undertake to reply by letter to any questions respecting the competitions.

FIRST LIST OF SUBJECTS.

A.—A detached villa residence, to cost £1,500, standing on a right-angle corner-plot of land, having a frontage of 45ft. and a depth of 150ft., situated in a suburban road, the building to be set back from the main road 18ft. There are to be no windows in the wall overlooking the adjoining site. The tradesman's door is to be from the front which faces the side roadway. The basement is to comprise wine, coal, and wood cellars, with a place for a safe and beer besides. The ground floor is to provide a roomy hall entered from an open porch, a dining-room 19ft. by 14ft. 6in., a drawing-room 20ft. by 16ft., a cloak-room out of hall, a kitchen of suitable size, with a scullery to match; also a larder and pantry, and a china closet, all having an external light. A servants' w.c. and dust-bin are to be reached from an open yard, which is to have a door in the wall of the inclosure opening into the garden. The first and second floors are to furnish, besides a bath-room and w.c. on first floor, seven bedrooms and box-room. The w.c. to have a ventilated lobby, and the staircase is to be screened from the front door, so as to be out of view on entering the house. The style chosen is to be suitable for execution in red brick and stone, sparingly used; roofs to be covered with tiles. The drawings are to be drawn to the scale of $\frac{1}{8}$th of an inch, and are to include a plan of each floor, an elevation of the front, a cross section, and a view of the house.

B.—A suite of furniture in oak suitable for the dining-room of such a house as is described in the last subject. The suite to consist of a buffet or sideboard 4ft. 3in. long and 5ft. to its highest part, a draw-out dining table on four legs, an armchair, an ordinary chair, and a dinner waggon. Designs to be drawn to inch scale, with a sketch of the buffet in perspective.

RULES OF COMPETITION.

1. Drawings to be sent in twenty-eight days after the publication of the list of subjects.

2. Usually two subjects will be given every month, from which a competitor may choose.

3. The drawings to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no marks or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line suitable for photo-lithography, or they may be outlined in brown indelible ink, and worked with sepia, taking care to keep the effect bright, so that good reproductions may be obtained by the photo-tint process. Sectional parts in either case to be shown in ruled hatching or blacked in. The scale used to be drawn with each subject.

4. Drawings to be forwarded unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible through the Book Post.

5. On entering the class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt being boldly marked on the front of each separate drawing.

6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs, such series not to consist of less than eight subjects. Our decision to be final.

7. Before awarding the prizes, any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.

8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.

9. A brief critical notice of the designs sent in of each series will be given, with illustrations of some of the chosen plans, in an early issue following the receipt of the drawings.

A DRAUGHTSMEN'S PROVIDENT FUND.

DURING the past few weeks a correspondence has been carried on in our columns pointing out the advisability of starting a Draughtsmen's Provident Fund, and to-day we publish a letter convening a general meeting of architects' assistants to talk over the matter on the 18th inst. in St. James's Hall, Piccadilly. About the issue of this meeting there should be little doubt. Next to the quill-driving clerks, the ordinary draughtsmen, whether employed in architects' or engineers' offices, are the worst paid and the hardest worked men in the kingdom, and anything which would tend to improve their position should have the heartiest support of all. Care will have to be taken that the subscription imposed should not be a heavy one, although, at the same time, it must be sufficient to meet the claims upon the fund and the working expenses of its management. In most similar benevolent societies there is, in addition to the subscriptions of the members, a considerable income from the subscriptions and donations of honorary members, and it is to be hoped that many an architect, remembering the struggle against sickness and poverty which he had in his younger days, may be induced to give an annual something in aid of those now passing through a similar period of trial. By the aid of these donations the scope of usefulness of the Fund could soon be enlarged. At first, perhaps, little more could be done than the payment of doctors' fees in the cases of subscribers who might fall ill during the coming winter, either from insufficient food and clothing (evils necessarily incident to small salaries), or from long hours of labour over the drawing-board. Later on, as the spring advanced and funds became more assured, a cottage might be rented by the seaside to which convalescents might be sent free of charge, and healthy assistants admitted for the short period of their annual holiday on a scale of charges proportional to their small incomes. Properly managed, it would probably be found that the cost of the cottage could thus be almost met, while those who availed themselves of it would find the expense of their holiday curtailed to a considerable extent. This system, once found to answer, could readily be extended in after years, both by the addition of other cottages in architecturally interesting parts of the country, and by the growth of some into convalescent homes. The cottages being almost self-supporting, other outlets for the useful expenditure of the fund would have to be found. The administrative committee, of whomsoever it may eventually consist, must always remember that the money placed in their hands is not to be laid by, but to be used; and that, so long as a

sufficient balance is in hand to meet contingencies, it will be their duty to see that any surplus is profitably expended for the benefit of subscribers to the fund. Probably by the time that such a surplus existed it would be found that some of the original subscribers had, through illness or misfortune, come to require monetary aid. Some of these could be pensioned, while presentations could be bought to some of the larger orphanages to which the children of others could be sent. By extensions of this kind useful employment could always be found for surplus funds, and the original subscribers constantly benefited, for it would naturally follow, upon a pension or presentation falling vacant, that the candidate who had longest been a subscriber to the funds would, other things being equal, stand the greatest chance of election. The advantages to be derived from a provident society are thus evident, and it is to be hoped that assistants will show their appreciation of them by attending in good numbers at the coming meeting, and entering into the matter in a thoroughly practical and business-like manner.

A "SAFETY THEATRE."

SOME days ago a suggestion appeared in our contemporary, the *Daily Telegraph*, for a theatre planned on safety principles, the idea emanating from Mr. Henry Irving, the well-known actor. A plan and section, worked out upon this principle, by Mr. Alfred Darbyshire, architect, of Manchester, accompanied the suggestions, the chief feature of which is the complete isolation of the site, a condition that is almost practically impossible in London, and very seldom to be found in those situations where theatres are built. The complete isolation appears to be an indispensable principle of this plan, Mr. Irving proposing that when such a site cannot be obtained, the theatre should be reduced in area so as to secure carriage ways all round, in addition to external balconies to be used by occupants of the dress and upper circles in case of panic. The structure further is proposed to be only one story high, the top "gallery" is abolished, while the only gallery permitted will be arranged on curved or segmental lines. The farther and upper part is only 24ft. high, being appropriated to the upper circle, and the lower the dress circle. These are reached by four straight staircases directly leading into the street at one end. The ground floor entrances and exits are short and straight, and the entrances are placed along one side, and the exits in corresponding positions on the opposite side, the mass of the audience being confined to the ground floor. The auditorium shown in plan measures 90ft. 8in. in length and 68ft. in width; the walls, instead of being curved in the usual form are rectangular, and run through the stage, which is 68ft. wide and 50ft. in depth, with the green-rooms and property-rooms and entrances at the sides. Between the main entrances to stall, pit, and gallery at the sides are the conveniences and pay-offices for the different sections, and at the front end of auditorium is a central exit from pit and stalls, with saloons on each side. As the entrances and exits from each portion of the auditorium are on opposite sides, the entrances can be turned into exits after the performances, thereby the exits are doubled. These are desirable points; but their directness and position would create draughts that we hardly think any automatic arrangement of closing-doors would obviate. The plan, it will be seen, completely sets aside the traditional horse-shoe plan of the auditorium, and only two boxes are provided. The result of the arrangement may be questioned from the acoustical point of view; in fact, we doubt very much whether the angles would not reflect the sound and create echo. The splayed sides of orchestra somewhat compensate for absence of boxes, and the domical and coved ceiling-landing down to proscenium would no doubt help the sound by confining it at the right point. The main objection to the plan is that the area of a theatre must be greatly increased. We will simply add: Mr. Irving proposes hot air introduced through flues for warming; the electric light as an illuminant; a curtain of asbestos instead of baize working in iron grooves, and a smoke shaft over the stage to allow the smoke to escape in case of a fire. These are useful, but not new suggestions.

At the Liverpool Architectural Society, Mr. Edmund Kirby, A.R.I.B.A., referred to Mr. Irving's ideal plan in his opening address, in which he spoke of the requirements for a safe theatre, and recalled many points and the want of administrative powers, a question to which we lately referred in a special article. Mr. Kirby pointed out that the plan suggested by Mr. Irving incorporates many of the ideas which have been made familiar since the late Exeter calamity. But the difficulty in the way of introducing a new plan is almost insurmountable. Theatrical managers and proprietors are at present much handicapped, and it is not very probable that large areas are likely to be acquired for theatres in crowded towns, the only places where they are likely to be attended. The architect receiving instructions for the planning of a new theatre would, as Mr. Kirby says, be required to cram as many people as he can on the building at the lowest cost. The demands for increased safety, more numerous exits and appliances, will certainly have the effect of checking theatre building for the present.

CHIPS.

The parish church of Kinnerley was reopened on the 20th ult., after restoration from plans by Messrs. Oswell and Smith, of Shrewsbury. Messrs. W. H. Thomas and Co., of Oswestry, were the builders. The work included re-flooring with wood blocks, encaustic tiles being laid in the passages, and re-seating in pitch pine.

New printing works have just been built for Messrs. E. S. and A. Robinson, of Bristol, opposite the National Schools in East-street, Bedminster. They are built of red brick, with terracotta dressings, are one story in height, and cover an area of 240ft. by 120ft. Mr. H. Crisp, of Bristol, was the architect, Messrs. J. Wilkins and Sons the builders, and the heating is by an overhead system of high-pressure steam pipes, carried out by Messrs. R. Dawson and Co., of Stalybridge.

The ratepayers of Bermondsey and Rotherhithe have decided by large majorities in favour of adopting the provision of the Free Libraries Act.

A dedication service was held at Warrington on Friday on the occasion of the opening of a new chapel that has been built for the joint use of the Warrington Training College and the Clergy Daughters' Institution. The building has been erected at a cost of £1,400. Mr. Gibson, Warrington, is the builder, and Mr. Adams, Warrington the architect. It is in the Gothic style, and will accommodate about 200 persons.

Alderman Jones, J.P., of Cardiff, died on Wednesday week, aged 66 years. He was for many years in business in the town as a builder and contractor, and in 1854 laid down the first system of sewers for Cardiff from plans by Sir John Hawkshaw. In 1874 he served as Mayor, and had, at the time of his death for 27 years been a member of the corporation.

A new Wesleyan chapel was opened last week at Heveningham, near Yoxford, Suffolk. It seats 110 persons, is Gothic in style, and built of brickwork. Messrs. R. Gibbs and Son, of Peasenhall, were the builders.

A brass has been placed in Limerick Cathedral to commemorate the late Rev. Joseph Gabbett, chancellor of the cathedral, his wife, and daughter. Mr. J. Vardy, of Wyle-cop, Shrewsbury, carried out the work.

The restoration of the parish church of Coombe-in-Teignhead, near Newton Abbot, was begun last week. Mr. R. Medley Fulford, of Exeter, is the architect, and Mr. Hugh Mills, of the same city, the builder. The 15th-century rood screen is being restored by Mr. Henry Hems, of Exeter.

The Theatre Royal, Wolverhampton, was reopened last week. The internal alterations include the auditorium having been re-painted and decorated by Messrs. Whittaker, Blackburn, reupholstered, furnished, and carpeted by Messrs. T. Edwards and Sons, Wolverhampton; a new stage laid by Messrs. Bradney, Wolverhampton; with the flash system of lighting applied, and a new act-drop, specially painted by Mr. Harry Mapleson.

The directors of the Lancashire and Yorkshire Railway have accepted the estimate of Mr. T. W. Helliwell, of Brighouse, to execute the whole of the zinc roofing and glazing on their intended new station at Rochdale, on his patent system of glazing without putty, and zinc roofing without external fastenings or solder. The total area is about 81,000 superficial feet of glazing, and 28,800 superficial feet of zinc.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

CAMBRIDGE ANTIQUARIAN SOCIETY.—At the meeting of this society, held on Monday night at the University Museum of Archæology, the new president, Professor Alexander MacAlister, M.D., delivered an inaugural address, in which he pointed out that the special function of a local society like theirs was to deal particularly with all that concerned the history of the Eastern counties. He referred to the physical condition under which the former race lived in that part of the country, and especially in the fen lands, and the effects of their habits of life upon the structure of their bodies and limbs. The professor subsequently showed the desirability of collecting all the ancient remains that were found from time to time of the ancient inhabitants of the district, and the importance of having such collection in a central museum such as that of the University, remarking that in that museum they had now the best collection of South English skulls.

LIVERPOOL ARCHITECTURAL SOCIETY.—The opening meeting of the thirty-ninth session of this society was held on Monday evening in the Royal Institution. The president, Mr. Edward Kirby, A.R.I.B.A., delivered an inaugural address, in which he spoke in favour of the registration of architects, and passed on to consider fires in theatres and the many suggestions—inclined planes for exits, fireproof construction, better ventilation, wire gauze or iron curtains, water sprinklers, and other expedients—that had been made since the Exeter disaster to prevent similar losses of life. In the subsequent discussion Mr. G. E. Grayson said it was of the utmost importance that special care should be taken by architects in the arrangement of exits for all public buildings. Mr. Thomas Cook expressed the opinion in regard to most places of worship and schools, that in case of panic it would be almost impossible for the congregation or scholars to get out, as the doors opened inwards. Mr. J. M. Hay was afraid that few public buildings were properly arranged for such a contingency. He suggested that there should be in cities like Liverpool a committee of architects to inspect public buildings. Mr. H. B. Bare thought the danger was that in consequence of recent panics legislative enactments might be made so severe as to make the erection of public buildings extremely difficult and expensive. Mr. A. White mentioned that in one theatre he had visited the curtain was fireproof, and there was printed upon it in large letters an announcement to that effect, and it was lowered between each act. If they could allay the fears of the audience in the event of fires there would be little risk of catastrophes. Mr. C. Aldridge said the great question was how to appease a panic immediately it arose.

MANCHESTER.—The Manchester Architectural Association held its first meeting of the Session 1887-8 on Tuesday, when there was a large attendance of the members. There were several new members nominated, and the secretary handed in a large number of books which had been received for the library. The president, Mr. Davies Colley, presented the prizes (amid applause) to the successful students in the classes of design and construction (Messrs. Ernest Farrar, A. S. Chadwick, and R. Booth). Mr. Mould, the hon. sec., announced that Mr. John Slater, B.A., the president of the London Association, had consented to read a paper on Nov. 29th on "Modern Architectural Education." The hon. sec. also read a number of communications, among them being one from the R.I.B.A., dated Oct. 12th (which was received with applause) thanking the Association "for the excellent step taken" of forming a reading class for the examination in architecture, and stating that in consequence the Royal Institute had decided to hold the Examination in Manchester next February. These preliminaries disposed of, the president delivered the opening address of the Session, which was of great interest (we shall publish an abstract next week), and touched upon a number of topics of general concern. A vote of thanks was moved by Mr. L. Booth (ex-president), seconded by Mr. T. Chadwick, supported by Messrs. Woodhouse, Perry, Mee, Mould, and Maybury, and eventually passed with enthusiasm.

HINDE-STREET WESLEYAN CHAPEL, W.

THE appearance of the exterior will be seen at once from the perspective view. The Classic, in preference to the Gothic, style of architecture has been adopted, as being better adapted to the requirements of the trustees, and more in harmony with existing buildings in the neighbourhood. The front in Hinde-street and the side in Thayer-street are of stone. The central portico, consisting of Doric columns for the lower story and fluted Corinthian columns above, is finished by an ornamental pediment. At the west corner a tower and steeple rise to the height of 100ft. Access to the body of the chapel is gained from the central portico, and to the galleries by two separate entrances, right and left, with stone staircases. The internal length is 64ft., and the breadth 56ft., providing ample accommodation for 455 people on the ground floor and 347 in the galleries, which are on three sides, making a total of 802 sittings. Heating is on Grundy's hot-water combined with hot-air system, and abundant and effective ventilation without draughts will be secured by double-hung sashes, and vertical flues as fresh air inlets. Gas fumes and vitiated air will be carried off by tubes in the ceiling, and constant exit ventilation is provided by shafts carried above the roof, capped with extracting ventilators. At the rear of the chapel is the chapel house, with a frontage of 32ft., and a spacious entrance in Thayer-street. In the basement are two classrooms—a large, airy, and well-lighted infants' classroom with double arrangement of galleries—and a kitchen well fitted with all the usual appliances. These rooms are approached from the main schoolroom and from the street. On the ground floor are the minister's vestry, and lavatory and three classrooms. On the first floor, overlooking Thayer-street, is a large room, which may be termed the "church parlour" or reception room, and which it is intended to have well furnished, with special reference to the meetings of ladies and young people. It measures 31ft. by 15ft. On the same floor is a ladies' retiring room, with lavatory attached. On the third and upper floors are additional classrooms and chapel-keeper's room. The architect is Mr. James Weir, F.R.I.B.A., 9, Victoria Chambers, Westminster; the builder, Mr. James Holloway, of Lavender-hill; the clerk of works, Mr. Girling. The stonework was supplied by Messrs. Pictor and Son. The ironwork was by Messrs. Steven Bros., of 4, Upper Thames-street, E.C. Hinde-street Chapel, erected in 1810, is one of the oldest Methodist sanctuaries of London. As early as 1761 a little company of believers was found in the neighbourhood of Grosvenor-square, to whom towards the close of that year Mr. Wesley paid a visit.

MANSIONS IN GROSVENOR-SQUARE.

THIS illustration furnishes a general view of the works carried out in rebuilding the corner of Grosvenor-square and Upper Grosvenor-street, from the designs of Mr. W. H. Powell, the architect. Messrs. Patman and Fotheringham built the main structure, and Messrs. Longmire and Burge are finishing a considerable portion of the work. The walls are faced with red bricks, enriched by red rubbers. The clerk of works is Mr. Walter Mitchell. A view of the entrance and loggia to the house in Upper Grosvenor-street was given in our issue of Sept. 16th last.

ST. GILES'S PARISH BUILDINGS, OXFORD.

THE first portion of these buildings, consisting of the large room, has recently been erected in the Woodstock-road, Oxford, closely adjoining St. Giles's Church, to provide a good room for the usual meetings, classes, concerts, &c., associated with church work. It is built of red brick, with freestone dressings and tiled roof, and has a pleasing, picturesque appearance. Messrs. Colston and Plumridge, of Oxford, were the builders, and Mr. H. Wilkinson Moore the architect.

DINING ROOM, DINORBEN COURT.

WE reproduce this week another of our series of drawings hung at the recent Royal Academy Exhibition. This is a perspective sketch of the end of the dining room at Dinorben Court, Hants. The wood framing has been executed in polished chestnut with walnut panels: the contrast thus obtained has a very satisfactory effect. The contractor, Mr. Watson, of Ascot, has carried out the work from designs and under the superintendence of Messrs. Charles Smith and Son, architects, of Reading.

ASYLUM AT HARTWOOD.

MESSRS. CAMPBELL, DOUGLAS, and SELLARS, architects, of 226, St. Vincent-street, Glasgow, are the authors of these drawings, which so far illustrate designs submitted in competition by them for the building.

TOMB OF THE TORRIANI, S. FERMO, VERONA.

THIS tomb is situated in the centre of one of the side chapels on the north side of S. Fermo Maggiore, a large and beautiful church in the west of Verona, celebrated for its excellent brickwork detail. The tomb was built about 1500 by two brothers in memory of their father Girolamo and brother Marco Antonio, both professors of high reputation at the Padua University. It is constructed mainly of white marble, the circular panel shown in the frieze being of verde antique, porphyry, and serpentine, and slightly curved on face. The upper part (not shown in the drawing) is supported by four sphinxes cast in bronze, and is decorated with cast bronze panels, which, however, are only copies, the originals having been carried away by the French to Paris.

CHIPS.

The committee of the Royal Masonic Institution for Girls have adopted plans by Mr. Hunt for the extension of the school buildings at Battersea-rise, estimated to cost £20,000.

A lecture hall, with schoolroom, class-rooms, and vestries beneath, has been added to Newington Presbyterian Church, Belfast, at a cost of £1,000, and were opened last week. Mr. W. J. Gilliland, Lombard-street, Belfast, was the architect, and Mr. Robert Corry, of Donegall Pass, in the same town, the builder.

The local authority of Driffield, Yorks, have decided to invite Mr. Harry Bohn, C.E., of Hull, to visit that town, and inspect and report on the present drainage system.

On Wednesday week the *employés* of Mr. Alderman Miskin, builder, of St. Alban's, presented to Mr. C. W. Miskin a Madalaine marble timepiece, on the occasion of his marriage.

A portrait of the late Dr. C. L. Carson, executed by Sir Thomas Jones, P.R.H.A., was formally presented to the town commissioner of Coleraine on Wednesday week, and has been hung in the large room at the town hall.

The town commissioners of Weston-super-Mare approved, on Friday, of plans, drawings, and estimates, by Mr. Cousins, C.E., for reconstruction of the sewers between Orchard-street and Birkbeck-road, at an estimated cost of £3,299.

The peal of eight bells placed in the tower of Bloxwich Church, in commemoration of the Queen's jubilee, was formally dedicated on Monday by the Bishop of Lichfield. The peal consists of the old tenor bell, and seven new ones founded and hung by Messrs. Mears and Stainbank, of London.

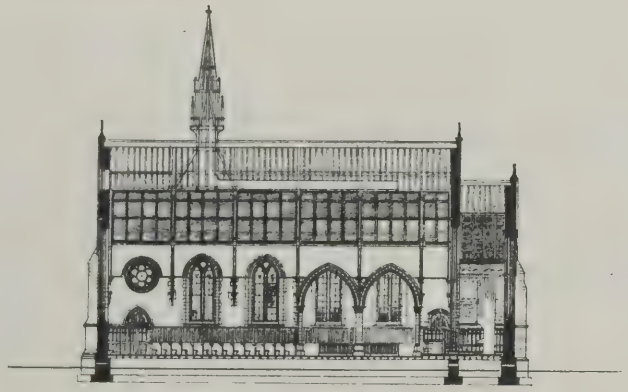
CAPITAL AND COUNTIES BRANCH BANK, LANDPORT.

OUR illustration shows this building, which has recently been completed. To minimise the ill effects of sea air and smoke combined on the structure, non-absorbent materials have been used. The outside is entirely built of buff terracotta and buff and Rockingham glazed bricks in bands, both supplied by Messrs. Joseph Cliff and Sons, of Wortley, near Leeds. The architect is Mr. J. Henry Ball, A.R.I.B.A., of Southsea, and the contractors are Messrs. W. R. and C. Light, of Landport.

NEW PREMISES, ENDERBY, NEAR LEICESTER, FOR THE ENDERBY CO-OPERATIVE SOCIETY (LIMITED).

THE premises consist of two shops, fronting the main road, with entrance to office and public hall. The first floor is utilised for committee, work, and stock rooms, and the upper floor for public hall for members and other meetings. The front is faced with Coalville pressed bricks, and the builders are Messrs. Langton and Sons, of Enderby. Mr. Thomas Hind, of Leicester, is the architect.

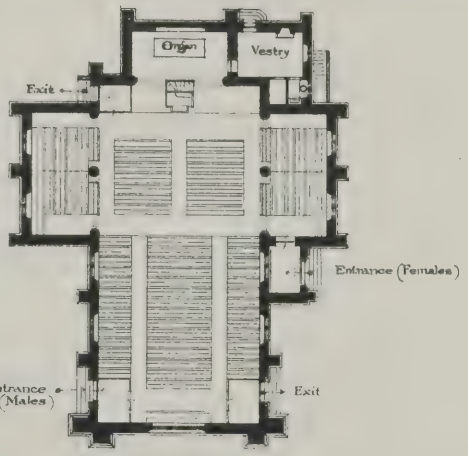
COMPETITIONS.



ST. ANNE'S, LANCS.—The local Lifeboat Memorial Committee recently invited designs for a monument to be erected on the Promenade, at St. Anne's, in memory of the crews of the two lifeboats who lost their lives last December while endeavouring to rescue a shipwrecked crew opposite that watering-place. Over forty designs were sent in, and the committee selected that submitted by Mr. William Birnie Rhind, sculptor, Cambridge-street, Edinburgh, who has received the order to proceed with the work. The principal feature of the design, which will be executed in freestone, is a colossal statue of a lifeboat man wearing his life-belt, looking out to sea, as if in the act of watching some vessel where his services may soon be required; his left hand rests on a life-buoy, to indicate the life-saving apparatus. The upper portion of the pedestal on which the figure stands is of rough rock work, and inscriptions will be carved on it. A deeply-splayed base forms the under part of the pedestal, the whole monument rising to a height of 20ft.

SCHOOLS OF ART.

GLASGOW COLLEGE OF SCIENCE AND ARTS.—The annual distribution of prizes and certificates gained by students attending the Glasgow College of Science and Arts, Bath-street, took place on the 27th ult. Mr. David Rowan presided. Reviewing the history of the College, he said that within the past eight years under the science and art and city and guilds examinations the students attending it had gained 2,068 first-class, and 2,742 second-class certificates; 58 first and 87 second honours; six silver and 37 bronze medals; and 17 Whitworth Scholarships. The last mentioned had been gained within the past four years, and amounted in value to £2,300. This last session five Whitworth Scholarships of £150 each, had been gained by John Calder, Nicholas K. Turnbull, Arthur F. Horne, Edward J. Duff, and William Thomson.



On Thursday in last week a special service was held in St. James's Parish Church, Longton, in dedication of two two-light windows which have been placed in the chancel to the memory of the late Rev. Adam Clarke, rector of the parish. The windows have been supplied by Messrs. Heaton, Butler, and Bayne, of London. The subjects selected illustrate and perpetuate the memory of the life and work of the late Rector. They are as follow:—"Our Lord Instructing Nicodemus," as teaching the ignorant; "Our Lord Comforting Martha and Mary," as comforting the afflicted; "Our Lord Feeding the Five Thousand," as feeding the hungry; and "Our Lord Visiting St. Peter's Mother," as visiting the sick. Their cost has been about £250.

The memorial stone of Bothkennar Parish Church, now in process of enlargement and restoration, was laid on Saturday. The work, which is estimated to cost £1,600, is being executed under the direction of Mr. Sydney Mitchell, architect, Edinburgh.

WAYSIDE NOTES.

IT would be a little interesting to the architect to know what percentage of the rabble that now daily gathers and "demonstrates" in the West-end of London is in any way connected with the building trades. But it is difficult to even hazard a guess. Probably there are few *bonâ-fidæ* artisans and labourers in the crowd. One, at any rate, we know there has been who has condescendingly represented the building interests! Did not one of the worthies that lately called at the Mansion House declare that he had worked for speculating builders?

Perhaps he was one of the gentlemen who threw up a job because he "got sick of it." We have the word of a "London builder" that such is a fact. Writing to a daily, he complained that some five men abandoned their work for this reason. Further, one other undesirable type of a building handicraftsman deserted his occupation because "he could not work by himself." Of the two grievances, the latter seems the most worthy of our commiseration. But, Lord (as old Pepys would have said), what a brilliant group of a half-dozen British working-men!

I dare not attempt to go deeply into a question about which so much has lately been written and said. It is far too wide and involved. But I would touch for a moment upon the aspect of the subject as it affects the building interests. And as the reader will possibly anticipate, I would place much of the distress of, and lack of employment for, the building artisan, craftsman, and labourer at the door of the reckless jerry-building system, *alias* Leasehold Tenure. Looking at the question in this light, I can see some slight excuse for the behaviour of the six artisans referred to above—that is to say, if their employer was a speculating builder.

No one can work well, and with that desirable pleasure in his occupation, who is employed by the impecunious speculating builder. What wonder that a man gets heartily sick of always working badly and having no aim but that of producing the cheap and nasty! For such is the labour of the servants of the jerry-builder. Honest and solid workmanship and deft craftsmanship are not required by our friend Mr. Buggins. He prefers rather the man who is a meretricious worker, and whose soul does not revolt against the studiously unworkmanlike manner in which he is compelled to labour. Most likely the case instanced above does not apply here, as in all probability the men were employed by a contractor or true builder. But the fact remains, nevertheless. So much as regards a somewhat narrow view of the labour question.

As touching a wider and more difficult question, if the jerry-builder's object is to produce an erection of brick and mortar, which he calls a house, with as little labour as possible upon its walls and fittings, how great must be the *loss* to the country, in that the necessity for labour is reduced to a minimum! Supposing that every building erected in the land were to be honestly and solidly constructed, how great would be the *gain* to the country, and how everyone connected with the production of the building, from architect to hodsman, would benefit! I merely put forward this position as a suggestion, well knowing the deeply involved nature of the question. Arguing on first principles, it would appear to have some weight, though, it is true, under the present order of things it is not always useful to debate on these data.

Thoughts of Trafalgar-square lead one by easy stages to a relic of the wooden walls of Old England, *yclept* H.M.S. *Victory*. It is sad to reflect on the approaching dissolution of this magnificent example of naval architecture of the early years of this century. I see that the repairs contemplated to the ancient line-of-battle ship include the removal of several of her old timbers that are worm-eaten. Fir is to be substituted. Why *fir?* In addition to this, the whole of the vessel above water-line is to be covered with canvas, which will be painted to resemble wood. After these repairs, "it i expected that the ship will last another century." Fond hope?

Query: Why do not students of naval architecture "measure up" the old *Victory*, and endeavour to press upon the public modern designs for vessels *à la* Late 18th century style?

I am glad to see that the reports received from the fever-stricken village of Burnriggs in Cumberland have been of a satisfactory nature. It is said, however, that there are several villages in the same district which require attention from the sanitary authorities, as "fevers" have lingered among them for many years." The sooner that this attention is paid the better.

In the course of an opening address on "Cremation," to the Medico-Chirurgical Society, at Nottingham, Sir Spencer Wells is reported to have said that "Scarlet fever is just now in London a question of greater urgency; although Dr. Ogle informs me that, notwithstanding the popular alarm, the deaths have in reality 'been considerably below the average for the previous 47 years.'" During the address Sir Spenser gave some remarkable instances of fever having been communicated by germs or spores from bodies buried some 30 years previously! But I cannot go into all the remarkable statements made by Sir Spencer Wells. There has been rather a lot about scarlet fever, and the like, in "Wayside Notes" of late, and I really must draw the line at "Cremation."

In a recent issue of the *Echo* there was an article headed "Smoke *v.* Sermons," which apparently was suggested by the letter of a correspondent of the *Nonconformist*. The latter writer is stated to have said that "up and down our country the worshippers smoke up to the sanctuary doors, and rekindle their pipes and cigars the moment they are outside." I do not mention this to comment on the morality of the proceedings complained of; but because the article forcibly recalled to mind the anecdotes of an old Welsh friend, who loved to enlarge upon the customs of the congregations of certain out-of-the-way village churches of the Principality. In days gone by, everyone desiring an illuminant in the churches in these remote districts had to take his or her own *candle*. For economy's sake, these candles were extinguished or "blown out" when the sermon commenced, and when the homily was concluded they were re-lighted. My friend would draw a vivid picture of the scene at such times; and the *odour!* Faugh! It was described as harrowing to a degree. And when the sermon was ended there was a general strike, strike all over the church, accompanied by a further unsavoury odour of sulphurous matches, as the candles were again brought into requisition by the congregation.

At the commencement of the week there was opened in Jersey a new Roman Catholic church, said to be the finest ecclesiastical edifice in the Channel Islands, and which has cost over £20,000. Now, I remember well meeting at Caen last August a gentleman from Jersey, who enlarged upon the beauties of this edifice. In eulogistic terms spake he of the building.

And I shall have some confidence in his statements, since he was an individual quite *sui generis*. It is not often that we find a modest amateur artist with a preference for drawing architecture pure and simple. Yet I came upon this gentleman after inspecting the *Abbaye aux Dames*, and found him engaged in sketching a "bit" of the abandoned church of St. Gilles, hard by, a building of exquisite loveliness in its decay. Much use I made of him afterwards in inspecting a few old buildings together. For I have ever found that laymen with a little knowledge of, and a genuine liking for, architecture make, at times, most suggestive criticisms upon buildings, and bring home to the architect, who is wrapped up in "architecturalism," many points in design and composition that he would often let go by unheeded. Their little knowledge may be dangerous to themselves, but it will often be found of assistance to the architect, giving him ideas, as the prattle of a child may set the wise man thinking. GOTH.

Building Intelligence.

BALSALL HEATH, BIRMINGHAM.—The premises known as Sherbourne Hotel and Concert Hall, at Balsall Heath, have recently been rearranged and redecorated. The spacious bars of the hotel have been elaborately fitted up in the Renaissance style, and these, together with the smoking and billiard rooms, have been redecorated. In the concert hall a complete transformation has been effected. The work of alteration, which has been proceeding during the past three months, has produced an elegant little hall, in which special attention has been devoted to the convenience of entrances and exits. From the gallery an extra staircase without a turn in it, and emptying itself directly into the street, has been built, and from the floor there are three ample exits, all the doors of which are hung to open outwards. On each side of the stage a fire hydrant has been placed, and in case of fire an immense volume of water in the form of a curtain extending the whole width of the stage can be discharged from above the proscenium. The whole of the seating has been re-upholstered, additional private boxes have been erected, and the hall tastefully decorated, the prevailing colours being sea green and salmon. The bars and billiard room are heated with small bore pipes by Mr. Renton Gibbs, of Liverpool. The general contractors were Messrs. C. Holloway and Son, Coventry-road, Birmingham. The work has been carried out for Messrs. Showells and Sons, Limited, brewers, from designs and under the superintendence of Mr. Franklin Cross, M.S.A., architect, 18, Temple-row, Birmingham.

CHEADLE.—An extensive new wing and other additions have recently been built to St. Wilfrid's College, Cheadle, Stoke-on-Trent, including a refectory, 70ft. by 26ft. and 20ft., recreation rooms, class-rooms, masters' rooms, and dormitory. The college being situated a considerable distance from any fire brigade station, it was desirable to have the building practically fire-proof, and for that purpose the floors are constructed with iron and concrete, and covered with Lowe's wood block paving, the refectory floor being paved with oak, and the girders are protected from fire by plaster upon wire lathing. The stair being also fireproof is designed to serve the older buildings of the college as well as the new wing. The work, costing about £4,000, has been carried out from the drawings and under the supervision of Mr. Peter Shaw, and the general contractor was Mr. John Fielding, of Alton.

GLOUCESTER ROAD.—The new morning chapel, vestries, and parish room, which have recently been added to St. Stephen's Church, Gloucester-road, Queen's-gate, from Mr. H. Roumieu Gough's designs, were opened on Tuesday last, All Saints' Day. Messrs. Chamberlain Bros., of Hammersmith, have carried out the contract for £1,400. Yorkshire parpoints, with Corsham stone dressings, have been used for the external walls, and the new work harmonises well with the existing church. Messrs. Jones and Willis supplied the ironwork of gasfittings, hinges, &c.

HECKINGTON.—The restoration of the chancel of this well-known beautiful Lincolnshire church is now completed, and the reopening services are to be held to-morrow (Saturday). The Bishop of Lincoln will officiate. The roof has been raised to its original pitch; the windows have been reglazed with cathedral glass, and, where necessary, the mullions and tracery have been removed; but in most cases the old tracery was in such a perfect state that very little renewal was found necessary. The floor has been raised 5in., and laid down with Minton's tiles, of varied patterns. The altar-rails have been carried further west, so as to include the sedilia. New carved oak stalls and prayer-desks have been put up. The sacristy, which is a peculiar feature of the building, has been completely restored. It consists of an upper and lower chamber. A groined roof has replaced the lath and plaster ceiling of the lower chamber; and upon this, the new tiled floor of the upper chamber, used as the vestry, rests. All the windows of the two chambers have been completely restored. A doorway has been broken

in the west wall so as to give access to the vestry without passing through the church. Externally, in addition to the new roof, all the finials have been renewed and raised to their original height. The work has been carried out by Messrs. Pattinson, of Ruskington, from plans by Mr. James Fowler, of Louth.

ST. PANCRAS, N.W.—The new goods depot, erected by the Midland Railway Co. on the site of some dilapidated houses on the west side of their passenger station at St. Pancras, was opened on Wednesday. The buildings consist of a goods depot constructed in duplicate. There is a station yard with sidings, platforms, cranes, and all necessary accommodation for working the traffic at the level of the streets, and a similar yard constructed about 24ft. above at a level corresponding with that of the rails of the main line at the north of the passenger station. The upper floor is formed entirely of wrought-iron plates and girders, supported on more than 400 cast-iron columns, and the structure is stated to contain over 20,000 tons of iron. The traffic is carried on by transferring the railway trucks from one floor to the other by hydraulic hoists. Facing Euston-road and Midland-road stores for vegetable traffic have been provided. The whole of the lower yard, covering an area of about 14 acres, is paved with granite up to and between the rails; the upper yard is approached by inclined cartways from Euston-road and Phœnix-street. On this upper floor is the general goods shed, 800ft. long and 150ft. wide, and a warehouse, 300ft. by 100ft., and four stories high. The works have been designed and carried out by Mr. J. A. Macdonald, M.I.C.E., under Mr. John Underwood, the chief constructive engineer to the company. The general contract, which was let to the late Mr. Joseph Firbank, has been carried out by Mr. George Throssel.

Engineering Notes.

INSTITUTION OF CIVIL ENGINEERS.—The opening meeting for the ensuing session will take place on Tuesday next, when an address will be given by Mr. George B. Bruce, President, and the medals, premiums, and prizes awarded during last session will be presented. At the meeting to be held on the following Tuesday, Nov. 15, Sir F. A. Abel will read a paper on "Accidents in Mines." At subsequent meetings the following papers will be read, with a view to discussion:—"Electrical Tramways: the Bessbrook and Newry Tramway," by Dr. Edw. Hopkinson; "The Use and Testing of Open-Hearth Steel for Boiler-Making," contributed by the late Hamilton Goodall; "The 'Jubilee' Bridge over the River Hooghly on the Line of the East Indian Railway," by Sir Bradford Leslie, K.C.I.E.; "Manganese in its Application to Metallurgy," and "Some Novel Properties of Iron and Manganese," by R. A. Hadfield; and "The Alexandra Dock, Hull," by A. C. Hurtzig.

Mr. A. Braxton Hicks held an inquiry on Monday at Wimbledon, as to the death of Mr. Frank Scott Haydon, B.A., aged 64 years, assistant keeper at the Public Record Offices, Chancery-lane, who shot himself with a revolver at his residence, Southey-lodge, Kingston-road, Wimbledon, on Saturday last. A verdict of temporary insanity was returned. The deceased was a son of the late Mr. Benjamin Haydon, the Royal Academician, who was instrumental in bringing the Elgin marbles to this country, and whose death by his own hand, in June 1836, shortly after publishing an autobiography, created a painful sensation in society. Mr. F. S. Haydon had been in the Record Offices for over forty years, and had edited for the series of Record publications the "Malmesbury Chronicle" of 1366 and other works.

An organ, built by Messrs. Young and Sons, of Manchester, was opened on Wednesday week, at the Presbyterian Church, Everton Valley, Liverpool.

The Bishop of London consecrated the new chancel of St. Thomas's Church, Godolphin-road, Shepherd's-bush, on Saturday. The nave of the new church, which has been erected at a total cost of £7,000, was opened by the late Bishop of London Dec. 28, 1882. The second section, the chancel, has been built by Messrs. Dorey, Brentford. The architect is Mr. A. W. Blomfield, and the church has seating accommodation for 700 persons.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—E. L. and Son.—S. S. B.—J. C. and Son.—J. W. jun.—C. D. and Co.—H. B. B. Co.—G. and Co.—A. W. K. and Co.—T. L. B.—R. and Co.—J. J. C.

Correspondence.

ARCHITECTS' ASSISTANTS' PROVIDENT FUND.

To the Editor of the BUILDING NEWS.

SIR,—There have been a few answers—very few, unfortunately—to the letter I wrote to you last week under the *nom de plume* of "Provident." The apathy of the assistants is most deplorable and disheartening. There is very little public spirit amongst them, yet the necessity for such a fund as the above is so great that it is one's duty to do them good in spite of themselves. A meeting will, therefore, be held on Friday, the 18th inst., at 7 p.m., in the meeting-room of the Society of Architects, St. James's Hall, Piccadilly, it being kindly lent for that purpose. A prominent member of the profession will take the chair. Nothing more can be done until that meeting is held. We shall then be able to judge if it is worth while to go on with the movement.

I earnestly appeal to every draughtsman who is anxious to provide for a "rainy day" to attend, and to remember that "God helps those who help themselves."—I am, &c,

W. A. CHAMBERS.

44, Battersea-rise, S.W., Nov. 1.

SIR,—The desirability of such an institution as a Provident Fund for architect's assistants will, we are sure, be felt by the major portion of draughtsmen and those in the profession. We trust, therefore, that it will receive sufficient attention to encourage the proposed meeting being called.—Yours, &c.,

London, Nov. 1. TWO ASSISTANTS.

DRAUGHTSMEN'S PROVIDENT FUND.

SIR,—I am sure that all assistants will agree with me that the proposal of "Provident" is an excellent one, and deserves to prosper. I hope all will support this movement in a hearty manner, and not depend on the efforts of others. Let each assistant act as if the success of the movement depended on his exertions alone; let all work with a will, and together, and come forward and give their support to a public meeting, should one be called, without waiting to find out if So-and-so will come with them. Act independently, and yet together; let them remember "Union is strength"; let them consider what prospects they have of being made comfortable in an independent manner, should they have to go through a prolonged illness. This is worth the consideration of married men and single men also, as I have no doubt some day they may marry. I am sure assistants are much indebted to "Provident" for his suggestion and the trouble he is taking for their welfare, showing that he is actuated only by a warm desire that his brothers (shall I say in affliction?) should improve their circumstances and dispel a dark cloud that has so long hung over their future. Now that he is making exertions for their good, let them one and all within the four seas assist in making his task easy for him, by writing him, intimating that they will give him their support, and make suggestions as he desires. This will encourage him in his good work. I inclose my card, and am—

FORETHOUGHT.

THE FUTURE OF THE ARCHITECT AND "THE ARCHITECT OF THE FUTURE."

SIR,—With reference to Mr. Woodward's letter under the above heading in your last issue, I need only say that if a comparatively unknown general medical practitioner were to address to a well-known London medical specialist, who did not even know him by name, a similar letter to that which Mr. Woodward addressed to me, such letter would meet with the contempt it would deserve: the cases are almost exactly parallel. I have been practising as a sanitary expert for more than 15 years, and am consulted not only by medical men and the public, but also by architects—indeed, I always have on my books large buildings in which the architects are superintending sanitary work carried out to the minutest details under my advice. If, instead of attempting to cast ridicule on "professors of sanitation," he would follow the example of my friend and colleague, Professor Roger Smith, and advise architectural students to attend courses of lectures and practical demonstrations on sanitary subjects, he would be doing the profession and the public a useful service.—I am, &c.,

W. H. CORFIELD, M.A, M.D. (Oxon.), F.R.C.P. London, Professor of Hygiene and Public Health at University College, London, Hon. A.R.I.B.A.

19, Saville-row, London, W., Nov. 1st.

SIR,—I do not suppose that one in a thousand of your readers knows what is the statement I made in the *Times* of the 1st October, which Mr. Wm. Woodward challenges me to prove, and seems to consider the council of the Royal Institute of British Architects should call upon me to confirm or retract. It is this: "*That very many so called architects are utterly ignorant of the most elementary laws of sanitation.*" I am content to repeat this, and leave it to Mr. Woodward to disprove if he can. It is he alone who is bold enough to call in question the veracity of the statement, and the onus of correction rests with him. Has he never met with any buildings, public or private, designed and superintended by architects, in which the drainage and ventilation have afterwards been found to be radically defective? Has he not himself been called in to remedy such? Has he never heard of so-called architects leaving such uninteresting matters entirely to their quantity surveyors, who also often write their specifications for them? It is not by shutting our eyes to such well-known facts as these, or by attempting to conceal them, that we can hope to inspire confidence with a long-suffering and unsuspecting public. The days for such a false policy as this are, happily, gone for ever,

and the public and the profession are alike calling out for protection against the evils of unqualified practitioners in their midst. The Royal Institute has recognised this so far as its own members are concerned, and has determined wisely to admit none to its associateship who fail to pass a qualifying examination; but how about the remaining and vast majority of architects throughout the kingdom? Is nothing to be done to insure that they are properly qualified before they are allowed to impose upon the public and gain their experience at the cost of their clients? I know well that Mr. Woodward and I have many views in common. We are both jealous for the honour of what should be a most noble and learned profession. We both "believe that architects are in need of a strong protective association," and I trust that ere long he will be an earnest worker in the cause which I have so long had at heart, and which I believe to be the only solution of the great question before us—namely, how to protect ourselves and the public from the disastrous results of quack professors of architecture. I mean the compulsory registration of all at present in practice or duly qualified, and a test examination or examinations for all hereafter desiring to enter the profession, not the Institute merely. The latter may eventually become a select club, consisting of the best men of the day, or it may take the position it ought to do, and be to us what the Royal College of Surgeons is to medical practitioners. Time alone will show which of these positions the Institute will occupy. Either is honourable in itself; but if I may venture, as an outsider, to express an opinion, I should say that unless the policy of its council undergoes some considerable change, it will not occupy the more honourable position of the two. No one would more deeply regret this than myself.

The proposition to seek the aid of the Legislature in order to close our profession has met with the cordial support of the public and of some 2,000 practising architects, and a very large number of the Members of both Houses of Parliament are in favour of such a Bill as has been drafted. Medical officers of health throughout the kingdom, who number some thousands, are, I believe, unanimously on my side, as are also, I am fully persuaded, a vast number of the members the Institute, but who yet withhold their support because the movement was not initiated by that body. It may be worthy of remark that the late President of the Institute, when in office, wrote to me saying that any such movement, if taken up at all, should emanate from the junior members of the profession, rather than from those who, like himself, had borne the heat and burden of the day.

I appeal not only to Mr. Woodward, but to all who have the welfare of the profession at heart, to put aside all paltry feelings of jealously as to who originated the movement, and to do their utmost to help it forward. The 180 members of the Institute who signed a memorial in favour of this scheme might do much if they would make their voices heard at Conduit-street.

The "strong protection association" would be found in the General Council, as proposed in the Draft Registration Bill—a body "having power to punish offenders, and to strike their names off the roll, as in the medical and legal professions."

The future of the architect will be perfectly secure when, but not before, "the architect of the future" is known by the public to be as properly trained and qualified to advise as are medical and legal practitioners. Then, and not till then, will the innumerable quacks who bring our noble profession into disrepute sink to that level which they so properly occupy in the medical profession.—I am, &c.,

HUGH ROUMIEU GOUGH.

12, Carlton-chambers, Regent-street, S.W.,
Oct. 31.

SIR,—As Mr. Woodward begins his letter in the last BUILDING NEWS under the above heading by a quotation from Lord Shaftesbury, will you allow me to follow his example in a few remarks on the same subject by quoting a more venerable, but to me unknown, authority: "When the sky falls we shall all catch larks"—for the architect and the sky are very likely to "stand or fall together."

That builders have been, and will probably be, often employed without an architect for small repairs and alterations may be very true; but that it is caused by builders reiterating that architects are not practical is very doubtful, for they are generally too prudent to say it in public, although they may know it to be true in many cases, and they seldom have an opportunity of saying it in private to employers until they are called on without an architect.

The two cases mentioned of a surveyor having taken the place of the late City Architect, and Wormwood Scrubbs Prison being built without an architect, may not be exactly a writing on the wall to foretell the "downfall" of the architect. It is quite possible that the City Fathers know that they have more work for a surveyor than for an architect, and that they prefer to employ one when they require him. Then as to the prison, we must remember that it was Major Jebb who designed Pentonville Prison, the starting point of modern improvement in prison-building, and he was no architect, and there may be quite as competent a man in the Prisons Department as any outsider. It certainly would not tend to prevent an impending downfall if architects were to cry out like employees on the Ordnance Survey against Sappers being employed, as it took the bread out of their mouths.

The "Professor of Sanitation" is, no doubt, almost invariably an unsavoury fungus, one that architects should guard against as carefully as dry-rot, as it is sometimes as injurious to a building. Any intelligent hodsman should know as much as the best of them, and yet even the worst would score more marks than Baron Munchausen in a competitive examination in his speciality. So it is scarcely necessary for Mr. H. R. Gough to imitate the naughty bird on their behalf; but as "there is no rule without an exception," a general condemnation implies that he who condemns "makes the rule." Mr. Gough's assertion at York that architects know nothing of science and engineers of art—is more disparaging to both, and if true, would be more suggestive of the apprehended "downfall" than the builder's reiteration. But, seriously, is there not more reason to fear a downfall from such claims and practices as are referred to in the article on "An Architect's Authority"? for if architect's claim to bind their clients without the client's authority or knowledge, and act on the claim, they will, in nine cases out of ten, bring about a downfall more or less serious. No architect has a right to bind his client to anything without his knowledge and consent, or where he may prudently anticipate consent, like those who rely on a bill of indemnity. What is said about binding an employer as against *third parties* only applies to ordinary matters usually left to the architect; but even then the architect, who is not a *third party*, is accountable to his employer. Surely "making percentages out of tradesmen" is simple robbery, with betrayal of trust superadded. It is not true that the builder would get it if the architect did not, for in many cases both would get it, and the employer should pay it; but when the contractor gets it he allows for it one way or other in pricing. An honourable man would as soon pick a pocket as take a bribe to betray the trust placed in him by a percentage.

There is no valid reason why an architect should not take out quantities for his own work if he does it properly—takes the usual risk for errors, and only charges the usual commission, to be paid by the builder openly from the first instalment to the knowledge of his client, without which nothing should be done, if that downfall is to be put off to St. Tibb's Eve, although some correspondents think clients should not see their builder's accounts! Cannot Mr. Woodward employ his surplus energy on such folk, and treat builders and their little jobs as Lord Melbourne advised Lord John Russell, "With masterly inactivity"?

Oct. 31. M. M.

SEVILLE CATHEDRAL.

SIR,—On looking over the back numbers of the BUILDING NEWS, issued during my absence from England, I notice under the date Sept. 2nd you publish a view of "Seville Cathedral, Gilbert S. Doughty, architect, *delt.*" One might fairly, I take it, assume by this wording that Mr. Doughty had made a drawing in the cathedral, of which your print is a reproduction.

The interior of Seville Cathedral is one of the very noblest creations of Gothic, or indeed of any style of architecture, and you would, I am sure, not wish to represent it to your subscribers in any but the most worthy manner, and we should all of us have valued a *bonâ fide* drawing, and admired the boldness and dexterity of the draughtsman who could accomplish such a subject with even a moderate amount of success.

For my own part, I should have been the first to have offered my congratulations to the artist who had succeeded in obtaining from the clerical authorities the rescinding of their absolute rule against sketching in a building which, as they told me after three days' efforts, was only for worship.

Failing in my efforts, I purchased a photograph by Laurent (of Madrid), which I have before me. Curiously enough (?) it is exactly the same size as your view, taken from the same point of view, and at the very same moment in the day (proved by the shadows) as Mr. Doughty's drawing! Such a coincidence would be most remarkable if it could not be, perhaps, explained in a rather more simple way—viz., that Mr. Doughty has made an *adaptation* (we will not say a *copy*) of Laurent's photograph.

The excessive darkness of the interior is rather unfortunate (for Mr. Doughty), as it rather obscures features and details. For instance, possibly for this reason he has adopted under the upper row of niches of the marvellous retable a somewhat simple form of diaper (!), in place of its actual elaboration of sculpture and ornament, which declined to appear in the photograph, except by such vague indications as just recall it to one who has studied it for hours through the close bronze work of the superb "reja" in front of it (which, moreover, he treats in a rather "severe style!").

Some of the piers of the church, too, are omitted where not quite clear in the photograph, and a dark picture-covered side chapel, with a rich metal screen, is "improved" into a blank wall. Besides these, such comparatively unimportant details as window tracery, mouldings, capitals, &c., &c., are altered boldly to what Mr. Doughty doubtless thinks the architect *ought* to have made them!

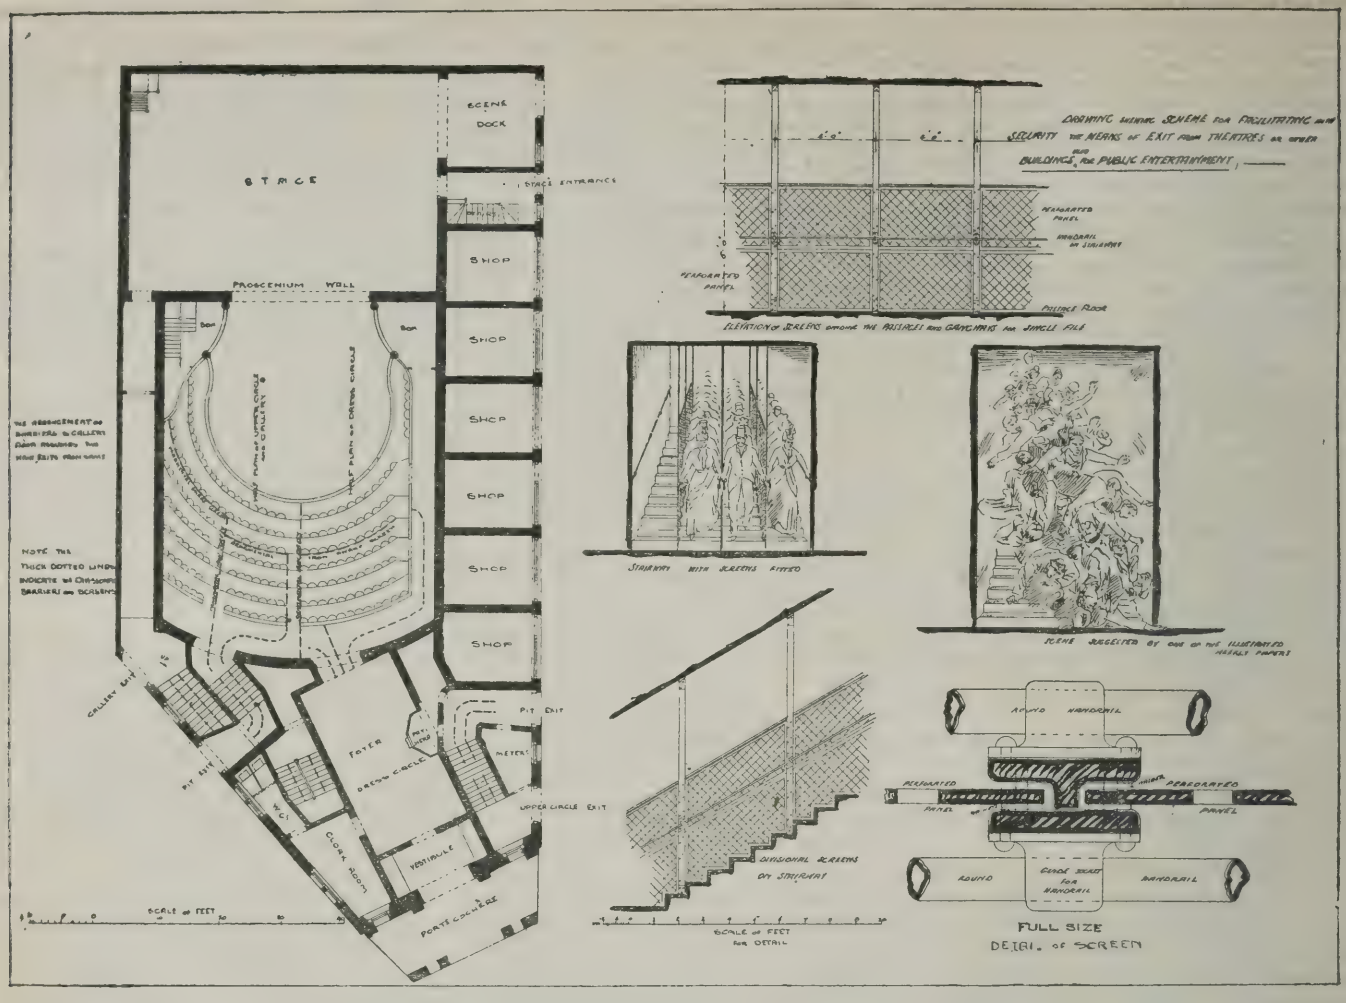
In the perspective of his pavement, Mr. Doughty has perhaps better "caught the feeling" of the copy; but he has not been so successful in his texture of the masonry of the walls and piers, having apparently aimed at the effect produced by a model cut in *cork*.

But I need not surely pursue the comparison further between the reality and Mr. Doughty's adaptation of it, and I do not intend to be hypercritical, or to speak hardly of the efforts of young and enterprising draughtsmen, to whom as a rule we are much indebted, so I will only express the hope that we may see in your pages many more illustrations of the noble architecture of Spain worthily represented, either by a reproduction of Laurent's almost perfect photographs, or by sketches and drawings honestly made from the buildings themselves.—I am, &c.,

R. HERBERT CARPENTER.

4, Carlton Chambers, 4, Regent-street, Oct. 29.

P.S.—Perhaps Mr. Doughty has intended it for a *joke*.



ST. ALBAN'S ABBEY.

SIR,—I have read the letter in your number of the 21st ult. respecting the pranks now being played with the abbey. I was at St. Alban's a few weeks ago, and was much saddened with what I saw had already been done.

I now learn that scaffolding is growing up the north transept, which is in a fair state of repair, apparently with the object of pulling it down and rebuilding it in the so-called Grimthorpean style, which is not remarkable for proportion, meaning, or beauty.

It is nothing short of a scandal that a man should be allowed to make a hobby of a national building so much to its detriment. The south and west gables have already gone, the north transept is in hand, leaving only the eastern gables and the tower to follow.

If the abbey authorities could only be impressed with their responsibility, and before it is altogether too late, of the folly and useless-

THEATRE PLAN: SHOWING MODEL EXIT.

ness of this Grimthorpean rebuilding, it would gladden the hearts of many another besides the writer. Will no one make an effort?—I am, &c.,

E. P. H.

A MODEL EXIT.

SIR,—Although the widespread horror raised by the extraordinary loss of life at the late Exeter Theatre has now in a measure subsided, the material cause of that calamity still exists at the present moment more or less in every theatre of the United Kingdom.

In the course of the last six weeks numerous suggestions have been made—in some instances for reducing the possibility of panics, and in others for preventing the evil consequences of the same.

Now, I think it may safely be said of the various schemes suggested that only a small percentage of them are really practicable; and further, very few of the practical ones are applicable to all our existing places of public entertainment, new and old.

Records of the loss of life in recent years resulting from panics in theatres or other buildings show that the death-roll has been largest where the unfortunate beings had to pass through long passages and down staircases before reaching the street. In these cases the majority of the victims were killed by being hurled down the stairs through their inability to resist the enormous pressure of the struggling mass behind them. And the escape of the others was effectually stopped by the piles of suffocated beings blocking the way.

A moment's consideration of the elements that bring about these dreadful affairs must disclose the cause of disaster; and in turn, the cause should suggest the remedy.

The pressure that one man, considered individually, can exert by mere pushing is insignificant; but give a man the opportunity in a crowd of using his shoulders as a lever and his neighbour's person as a fulcrum (which is the principle at work in a struggling crowd), the one-man pressure has become appreciable. Multiply this by 50 or a 100 men doing the same thing, the compound accumulation has become enormous, until the front and middle portions of the mass are carried off their legs, hurled along at the mercy of those behind only to find a terrible death if a stairway should come in the line of flight.

The remedy, then, that is to counteract this I think is obvious. In the case of a theatre or public place of entertainment, the body of the audience must be so divided on leaving the auditorium that the minimum amount of pressure is exerted, however eager persons may be to go forward. And if accessories can be introduced to check even the minimised pressure so much the better. In the drawing accompanying this letter I have endeavoured to incorporate a scheme that will not only give great facility in leaving a theatre, but combine with it the utmost security. The simple principle of the expedient is the insertion of divisional screens and barriers in the exits of a building, as shown by the drawing.

The divisional screens in the passageways and on the stairs are formed by placing wrought-iron standards from floor to ceiling of T-section, 3in. by 1in. by ½in., 4ft. apart, fixed at top and bottom. To those are screwed wrought-iron bars, 3in. by ½in., of same height, and fixed after ¼in. wrought-iron perforated panels have been placed in position, the standards being then of I-section.

At a convenient height from floor, a round bar handrail would be run on each side of the screens, and also to the walls flanking the side gangways, thus placing two handrails for each file of persons; single file being the manner in which the audience must necessarily leave the building, as the passageways formed by the screens would be 2ft. 3in. wide, made a little more or less as the dimensions of the passageways and staircases of existing theatres would necessitate. The height of the panelled portion of screens should be about 5ft. from floor to insure complete isolation of each gangway, Openings would be left in the screens—say on landings—to avoid the possibility of two people meeting face to face in one gangway.

Under this principle, it will be seen that the only pressure, if there is any at all, which a person has to contend against is the pressure of the single line of persons behind him or her; while in addition, the assistance of two handrails to each individual descending at stairway, for instance, would reduce the possibility of disaster to absolute zero.

A simple system of dwarf screens or barriers would be devised for the auditorium, so that the house is divided into sections of some 40 or 50 people, each section under the arrangement being compelled to leave the building by its apportioned gangway. The accompanying drawing shows the scheme for a particular case. The plan is that of the late Exeter Theatre, enlarged from the one published in the *Daily Telegraph* the day following the news of the disaster. The design of the barriers in the several parts of the auditorium would be in harmony with the composition of their surroundings of less severe character than their brethren in the exit passages, and of course constructed to avoid interference with the view of the stage.

I must mention, in conclusion, that the main idea of this scheme was suggested to me by Mr. E. S. Gunn, of the Metropolitan School of Shorthand, Chancery-lane, who wished to see his idea put into a practical shape. I venture to think this simple plan meets in a thorough manner the great danger accruing from the evolutions of a mass of panic-stricken individuals frantically struggling for life in a passageway or staircase. Dangerous panics will occur at periods in theatres in spite of the preventitive and palliative effects of iron curtains, electric light, and printed directions to "keep cool in case of fire!" And if the appalling loss of life witnessed at Exeter, and a year or so back at Sunderland, is to be minimised, if not entirely avoided, the means of exit from public places of entertainment must undoubtedly be made more rapid and secure by some such means as I have here described.—I am, &c.,

32, Walbrook, E.C. SYDNEY B. BEALE.

DRAIN TRAPS.

SIR,—I should be glad if "Clerk of Works" would communicate with me, giving his name and address, and I will then send him full particulars of my traps, and he can examine the question for himself.—I am, &c.,

W. BROWN, Architect.

Clifford-street, York, Oct. 29.

Intercommunication.

QUESTIONS.

[9445.]—**Carpenters who have Become Great.**—Can any one mention the names of some men of mark in this century who began life as carpenters?—CURIOUS.

[9446.]—**An Old Saw.**—I possess in my collection an old saw, bearing the date A.D. 1592, and the initials "W. B." and "R. V." The date is assuredly genuine. Does anyone know of an older one? It was, no doubt, used continuously in Exeter until a few years ago. I put this query in this column some time ago, but without result. I asked the same question in *Notes and Queries* a while ago, and some foolish writer quoted a still older saw in the Bath Museum. Inquiry, however, led to the discovery that the Editor had been shamefully hoaxed, and that no old saw existed there.—HARRY HEMS.

[9447.]—**Buenos Ayres.**—Can any reader of the "B. N." who has had experience in Buenos Ayres or the Argentine Republic generally, kindly say whether there is a good opening for an architect and surveyor in that country?—K.

[9448.]—**Blue Staffordshire Bricks.**—Some makers mould these from plastic clay, whilst others press them from dry powdered clay. I am told that the latter will not stand the weather. Would any of your readers who understand the difference kindly give some information as to the advantages and disadvantages of each kind of brick?—S.

[9449.]—**Letting Contracts.**—A. and B. are invited to give a contract for some ironwork for a warehouse, no specification or quantities supplied, and nothing stated as to the lowest or any tender being accepted. B. lost the job, although B.'s tender was considerably less in amount than A.'s. Has B. any remedy, or can B. claim any compensation? Both A. and B. were fully qualified to execute the work.—L.

[9450.]—**Masonry and Stone Cutting.**—Referring to Mr. Lawrence Harvey's first lesson on the above subject, p. 642, is the following really true, or is it a slip of the pen or a misprint?—"In that case (in architraves) the stone offers a much greater resistance when its quarry beds are placed *vertically*, as was practised by the Greek, Roman, and Mediæval masons." The italics are my own. Would a wood lintel also be stronger if the grain ran vertically instead of horizontally? It appears to me that the statement requires further elucidation to warrant its acceptance by your readers.—A. HANSON.

[9451.]—**Roof Boarding.**—I have heard lately that in several instances architects have omitted the usual varnishing from the underside of deal roof-boarding in the open roofs of churches, chapels, and large halls. The effect is, I am told, not particularly pleasant at first, on account of the lightness of the colour of the wood; but that this tones down in a few years, when it looks better than if it had been originally varnished. I should be glad if your readers would favour me with advice in the matter. On the ground of cleanliness, is it not unadvisable to adopt this course? If varnish be omitted, should the wood be lightly stained with a transparent stain, and sized to stop the pores, and so prevent shrinkage?—W.

[9452.]—**Norman.**—I should like to know the correct dates of the choir and nave of Durham and the choir and transepts of Norwich. Those given by the guidebooks and treatises on the style are not to be depended on, as the accounts vary. The names of any churches which retain apses of the period will be gladly received.—W. H.

[9453.]—**Load on Beams.**—If four baulks of pine, 18in. square, are laid across two walls, making 20ft. span, 3ft. 6in. apart, what weight would they sustain, having the load distributed over 14ft., 1ft. 6in. from one wall, and 4ft. 6in. from the other? A reply from some practical reader will oblige.—G. B. N.

[9454.]—**Lime in Skins.**—May I venture to ask some of your readers who have some acquaintance with chemistry to kindly inform me, through your pages, how lime may be washed out of skins that it will leave no trace, and that strength of skins may not be impaired—that is, skins that have been unhaired by lime? The lime may be dissolved so that it will wash out, so that the skin may dry transparent; or, please refer me to some work wherein I can obtain the information.—J.

[9455.]—**Technical Education.**—Will some reader kindly say if he knows of a good work on this subject, and whether any regulations are in existence with reference to laboratories, &c.?—CONSTANT READER.

REPLIES.

[9426.]—**Arch in Lincoln Cathedral.**—The sketch published last week seems to suggest that the S.W. tower has shown an indication to lean towards its neighbour, particularly if there is a set-off as shown in section.—J. P.

[9432.]—**Black Stains in Varnished Stained Deal.**—On reference to the specification and the work, I find it was pine used for the dado as "Tekton" suggests. I should feel glad of any suggestion to remedy the same in case of it spreading all over. The stains are not generally deep, and can be scraped off in most cases.—H. H.

[9434.]—**Refusal to Proceed.**—A tender submitted by a builder, and the acceptance by employer, make a contract, and the parties in law are bound. The only case I know is Lewis v. Brass, 1877. If the acceptance was made in writing, B. has a better chance to compel the performance.—G. H. G.

[9439.]—**Science for Engineers.**—It would certainly be to the advantage of a young man who has served his term of pupilage to take a three years' course of study at South Kensington. "Science" had better apply for particulars to the department, when he will receive a syllabus of lectures, list of textbooks required, &c.—G. H. G.

[9440.]—**Roof.**—Couples 18in. from centre to centre must mean 18ft.; if so, the distance is at least 6ft. too great. In the construction there seems to be no trussing, and the rafters would be inclined to sag. The collars would only prevent spreading, but would not assist to give strength to the rafters. I do not understand the "3 by 2in. piece running the length of roof and spiked to the backs of the upper and lower collars." No purlins are mentioned, and 4 × 2in. rafters without purlins would be weak.—G. H. G.

[9441.]—**Early English Foliage.**—Mr. Colling, in his "English Mediæval Foliage" (p. 37), says: "The Early English triple leaves are supposed to have been taken from the water avens anciently called the "Herba Benedicta," or Holy Herb, the leaves of which consist of three slightly serrated round lobes. They are divided in the older examples quite down to the central stem, and each leaflet is again subdivided into three."—HARRY HEMS.

[9442.]—**Mortar.**—I find the best way for securing any prescribed proportions in making mortars is, for instance, to put down three more loads of clinkers and cinders and roughly flatten the heap, then tip a load of unslaked lime and spread that evenly over same, finishing with a top layer of two or three more loads of ashes, making the proportions as desired. Have this pile turned over once, and pug from it as desired. If on a big job, increase the quantities. One uniform mortar is certain.—G. B. N.

[9443.]—**Perpendicular Style.**—Consult Fergusson's "Handbook," Gwilt's "Encyclopædia of Architecture," where, I believe, a list of architects will be found. Not many old examples of Perpendicular are to be found in London. I may mention the following:—St. John's Gate, Clerkenwell; the Guildhall; Crosby Hall and Westminster Hall; and notably Henry VII.'s Chapel, Westminster Abbey.—G. H. G.

[9444.]—**Cavendish Memorial Tomb.**—The memorial in question has been placed in Cartmel Priory Church.—GEO. F. ALLENDER.

CHIPS.

A dinner was given on Monday week at the Exchange Tavern, Lombard-street, E.C., to the employés of Messrs. Colls and Son, of Moorgate, to celebrate the completion of Messrs. Lloyd, Barnet and Bosanquet's new bank in Lombard-street. Mr. Brooks, representing Messrs. Colls and Sons, took the chair, and Mr. Bamford, clerk of works, the vice-chair. The health of the architect, Mr. J. A. Chatwin, of Birmingham, was proposed by Mr. Hutchinson, foreman of works, and was received with enthusiasm.

The central lights and tracery of the large window of the library of Sion College on the embankment have been filled in with stained glass, the gift of Mr. W. H. Willis. In the principal lights are figures of Chaucer and Caxton, on a diapered groundwork, and surrounded by a foliage border. In the tracery are shields with the arms of the See and City of London, the city of Bristol, the donor of the glass, and the founders of the college and library. The window is the design and work of Messrs. Joseph Bell and Sons, College Green, Bristol.

A stained glass window, which has been placed in the eastern wall of the workhouse chapel of the City of London Union, Lower Clapton, was unveiled on Friday last. It is a reproduction of Holman Hunt's picture, "The Good Shepherd," and has been executed by Messrs. Pitman and Son, of Newgate-street, E.C.

The foundation of a new Congregational church was laid last week in Dyer-street, Cirencester. It will be Italian in style, and will seat 424 persons, at a cost for erection of £2,800. Mr. W. Gilbee Scott, of Bedford-row, London, is the architect; Mr. T. H. Kingerlee, of Oxford, the builder; and Mr. J. Lancefield the clerk of works.

The new church of St. Lawrence, situated at Catford Bridge, Lewisham, is one of three churches intended to be erected by the Lewisham Church Extension Association. Mr. H. Roumieu Gough, of Carlton-chambers, Regent-street, is the architect, and the building is rapidly approaching completion, and will be consecrated by the Bishop of Rochester on the 19th inst. Accommodation is provided for about 1,000 worshippers, and the church, which is moderate in cost—namely, about £7,500, is admirably adapted to the excellent site it occupies. Mr. John Lister, of Aston, near Rotherham, is the contractor.

On the evening of Thursday week, the students and friends of the Salisbury School of Science and Art commemorated its 21st anniversary by a most successful *soirée*, held at the school. During the evening a presentation of valuable plate was made to the head master, Mr. Joseph Harris, who has successfully taught the school for the past sixteen years.

LEGAL INTELLIGENCE.

IN RE J. G. STIDDER.—(London Bankruptcy Court, Nov. 1, before Mr. Registrar Linklater.)—The bankrupt, who had carried on the business of a sanitary engineer at 50, Southwark-bridge-road, under the style of J. G. Stidder and Co., filed his petition in May last, and now applied for his discharge. The liabilities amounted to £10,625, in addition to £27,172 not expected to rank; assets, £2,927.—The Official Receiver reported that the bankrupt commenced business in 1870 with a capital of £1,400, and had been financed throughout by a person who, in consideration of the advances made, was to receive interest thereon and a percentage of profits.—The Registrar suspended the bankrupt's discharge for six months.

IN RE CHARLES CHURCHILL.—A first meeting of creditors was held on Wednesday before the Official Receiver. The debtor was an importer of American machinery, carrying on business at Cross-street, Finsbury. His accounts showed liabilities to the amount of £15,213, and assets £3,972.—Mr. Van Praagh, for the debtor, had no proposal to make, and the proceedings accordingly resulted in bankruptcy, a trustee and committee of inspection being appointed.

IN RE GUY AND BEVAN.—An adjourned sitting for public examination was held under this failure on Wednesday. The bankrupts, Messrs. Richard George Guy and Lambton L. L. Bevan, were timber merchants, carrying on business in Fenchurch-street as George Guy and Co., and at St. John, New Brunswick, as Guy, Bevan, and Co. Their statement of affairs showed liabilities £179,286, of which £105,229 were expected to rank, with assets £25,323. Both bankrupts gave evidence and passed their examination.

WATER SUPPLY AND SANITARY MATTERS.

DENNY AND DUNIPACE, N.B.—A report has been received by the Commissioners of the burgh of Denny and Dunipace upon a proposed water scheme for the district, drawn up by Messrs. Kyle, Dennison, and Frew, civil engineers, Glasgow. The engineers have, as a source of supply, the Garvald Burn, which flows into the river Carron, 1½ miles to the west of the town. Allowing 30 gallons of water a head per day, the quantity of water required for the burgh is 122,400 gallons per day. The Garvald Burn area district is estimated as capable of discharging water at the rate of 141,000 gallons per day, and the Overton Burn, which could also be utilised, has a drainage area yielding 163,000 gallons per day. They, however, consider the Garvald Burn as sufficient for the demands at the present time. It is practicable to construct reservoirs at this place to contain a quantity of upwards of 12,500,000 gallons of water, equal to a full supply for the burgh for 102 days. The elevation of the clear water tank would be 220ft. above the highest point in the burgh. The total cost of the Garvald Burn scheme would not exceed £5,700, which includes 10 per cent. for contingencies, but exclusive of cost of land or wayleave or pipes within the burgh.

MUNICIPAL SURVEYORS AT LUTON.—A district meeting of the Association of Municipal and Sanitary Engineers and Surveyors was held at Luton on Saturday, chiefly for the purpose of inspecting the new sewage works lately completed by the corporation at a cost of £20,000. Among those present were the president (Mr. J. Gordon, of Leicester) in the chair; Mr. Lewis Angell, of West Ham; Mr. E. B. Ellice Clark, of Westminster; Major L. Flower, engineer to the Lea Conservancy Board; Mr. C. Jones, of Ealing, &c. A paper upon "The Sewage of Luton, Past and Present," was read by Mr. W. H. Leete, borough surveyor, under whose supervision the works have been carried out. In this it was stated that Luton has a population of about 35,500, and its municipal area comprises 2,600 acres. It is situated at the head of the Lea watershed, and above the intakes of the London Water Companies, by whom its treatment of its sewage has always been jealously watched. The sewage of Luton is distinctly of an exceptional character, being deeply coloured by the dyes, both vegetable and aniline, used in dyeing the straw plait, and it is not possible to disintegrate its component parts unless by very costly treatment. The town council last year purchased 70 acres of land about one mile from the town, which they have converted into a sewage farm. This land, the greater part of which lies on a hillside, is about 200ft. above the level of the town, and the sewage is forced up to it by a powerful horizontal double-action engine and pump combined, worked by boilers of 130H.P. The sewage falls into a series of tanks from which it is led over the farms by means of an arrangement of sluices and carriers. The land is of a chalk formation with a covering of staple soil. The greater part of the farm is laid down in rye grass. The cost of working is very

low, and the result of the scheme has proved satisfactory to the corporation. In the discussion which followed the reading of the paper, Major Flower said he had come to the conclusion that land was the only absolute purifier of sewage, although there were cases where some chemical processes answered well. The Lea Conservancy Board were exceedingly pleased with the thorough way in which the Corporation of Luton had met the case. Some discussion followed. The members of the association afterwards drove over the sewage works and visited the water company's works, after which they were entertained at luncheon by the mayor at the town hall.

THE SEWER OUTFALL WORKS AT BARKING.—On Saturday the members of the Metropolitan Board of Works went down the river by steamboat to inspect the works in progress at the main outfall of the northern sewerage system near Barking Creek. The operations, which are about half complete, are being carried out by Messrs. Mowlem and Co., under a contract for £406,000, and were commenced in February, under a bond to deliver them over in July next, subject to penalties of £300 per week in default. Thirteen precipitating tanks on the land-side of the existing reservoir will receive the sewage, which will remain for two hours in a quiescent state for the deposition of the sludge. The effluent water will then be run off into the river, and the sludge into other tanks, where it will settle for ten hours longer to remove more of the liquid, which will be used for mixing with lime to form a precipitating agent. The settled solids, still containing 90 per cent. of moisture, will be passed through pipes and loaded into ships, in which, unless it prove of commercial value, it will be carried away to sea. The works executed up to the present time amount to £135,000, and 2,000 men are engaged upon them.

CHIPS.

Mr. Henry Henshaw Hadfield, of Manchester, a well-known drawing master and painter in that city, died on Friday last, aged 78 years. He was a pupil of the late Michael Calvert, and was afterwards for many years honorary secretary of the Manchester Academy of Fine Arts. About 30 years ago he published a work on "Perspective," which had a wide sale at the time. Among Mr. Henshaw's pupils were his cousin, Mr. T. Oldham Barlow, R.A., and Mr. John Brett, Mr. Ward Heys, and Mr. R. B. Wallace.

A memorial window, the work of Messrs. Saville and Young, of London, was unveiled in Shebbear parish church, Devon, last week. The subject is the Ascension.

The names of the following builders appear among the adjudications in bankruptcy in Tuesday's *Gazette*:—William Martin, of Willesden-green; William Adams, jun., Maindee, Mon.; and Thomas Potterton, Cavendish-road and Railway-approach, Balham.

Miss Sophie d'Ouseley, who presented a picture of Westminster Abbey to the Queen, has been commissioned, the *World* says, by the ladies of Cornwall to paint the picture of the interior of Truro Cathedral, which is to be given to Mrs. Benson, the wife of the Archbishop of Canterbury.

In the Manchester Chancery Court, on Monday, on the petition of Messrs. Littlewood, architects, an order was made to wind up the Palace Hotel Hydropathic and Spa Company (Limited), Birkdale.

The highest award of merit at the Adelaide Exhibition has been awarded to Messrs. Edward Smith and Co., of Coalville, Leicestershire, for their ornamental floor and wall tiles.

The Hertfordshire Michaelmas Court of Quarter Sessions on the 20th Oct. decided to increase the salary of the county surveyor, Mr. Urban Smith, C.E., of Westminster, from £400 to £500.

A girls' club room and school of cookery have lately been built in connection with St. Clement's Schools, City-road. Messrs. Wallace Bros. are the builders employed, Mr. Hugh Roumieu Gough, F.R.I.B.A., being the architect.

A new post-office for the rapidly-rising watering-place of Cromer, Norfolk, is shortly to be erected from the designs of Mr. H. Roumieu Gough, who is also about to build himself a seaside residence there, having many other important works intrusted to him, besides the management of a large estate.

Walter Hind, aged 40, builder, was committed for trial by the Worship-street police magistrate on Tuesday on two charges of forgery, and having knowingly uttered forged cheques.

Mr. E. Pritchard, of 2, Storey's-gate, Westminster, and 347, Waterloo-street, Birmingham, who failed in Chester 24 years ago as a contractor, and paid a composition of 2s. 4d. in the pound, has this week paid all his creditors the remaining 17s. 8d. in the pound.

Our Office Table.

MESSRS. C. E. HALLE and J. COMYNS CARR announce that they have resigned their positions on the direction of the Grosvenor Gallery, which they have held since its establishment in 1877, on the ground that in placing the virtual control of the Gallery in the hands of a man utterly unconnected with Art, and wholly ignorant of its aims and requirements, Sir Coutts Lindsay has removed every guarantee that its future conduct shall be consistent with the high and worthy purpose with which it was originally established. Mr. Alma-Tadema and Mr. Burne-Jones have written to Messrs. Hallé and Carr in terms of approval of this secession. Mr. Tadema thinks it more than doubtful whether he should be justified in continuing to exhibit at the Gallery; while Mr. Burne-Jones goes further, and positively affirms that his connection with the gallery is over. Sir Coutts Lindsay writes that he proposes to make no change in the management of the gallery. Sir Coutts seems also to show that the quarrel is but a private one of no public interest; but as Mr. Fredk. Wedmore says, in an able letter in which he reviews the history of the Grosvenor Gallery, no small share of its policy has been initiated by the assistant directors. Although no man, and indeed no picture gallery, is really necessary, the split in the Grosvenor directorate can scarcely fail to have a marked and possibly serious effect on the fortunes as well as the character of the Grosvenor exhibitions.

THE recent encounters in Trafalgar-square between the police and the ill-employed have suggested to several correspondents of the daily press that that open space might be rendered far more agreeable and ornamental with any other treatment than the present method of paving the whole area. "J. M." proposes that the square should be inclosed by a strong and high ornamental iron railing surmounted by sharp spikes and provided with four gates. Mr. William Woodward replies that this would be a step in the wrong direction, for the tendency in the parks and ornamental inclosures of London is to get rid of all prison-like railings, and to substitute low rails and curbs. His own proposal is that Trafalgar-square should be laid out as an ornamental inclosure designed by a landscape gardener. The base of the Nelson monument should be, he thinks, also inclosed by a low curb or cordon of old-fashioned wood posts and chains, planted with shrubs and laid with green turf. Thus two objects would be secured—(1) the beautifying of one of our finest open spaces by green grass and evergreens; (2) the closing of the square as a Mob Forum.

MR. JAMES LEES, of Goole, who was terribly injured by an explosion of fireworks on Jubilee day, is pronounced to be hopelessly blind. He cannot, therefore, retain his position as manager for the gas and water company. He is 48, and has a wife and two daughters. A fund is being raised locally, and contributions are being sent in by building and engineering firms, and by persons connected with gas and water undertakings. Mr. Lees was formerly an iron founder in Carlisle, and was afterwards on the staff of the Pimlico foundry of Messrs. Young and Co. The secretary to the Lees fund is Mr. G. W. Cutts, solicitor, Goole. The contributors include—Mr. Geo. Livesey, South Metropolitan Gas Company (£25); Messrs. Dempster, Manchester (£20); Messrs. Spence and Co., Manchester; Messrs. Guest and Chrimes, Rotherham; Messrs. Bray, Leeds; Messrs. Dixon and Sons, Leeds; and others in all parts of the country.

PROFESSOR BALDWIN BROWN, in opening the Fine Art Class in the Edinburgh University for the winter session, took for the subject of his introductory address the Epic Poem of Babylonia, recently deciphered in part from clay tablets found in that country. It was still very fragmentary; but they had enough to form some idea of it, and to compare it with some of the earliest Greek poetry. The indebtedness of Greece to the East was now universally acknowledged, especially in mythology and the arts. It was now seen that Greece borrowed much more largely from Babylonia than from Egypt. Like the "Iliad," the Babylonian Epic grew out of collection of separate lays of great antiquity. These lays were evidently put into something like a continuous whole 1,000 years before the days of Homer. The Babylonian Epic was made up of twelve cantos, and contained about 3,000 lines. It was divided into several episodes, one of which, entitled the Chaldæan account of the Flood, resembled in a very remarkable manner the story they had in the book of Genesis of the Flood. Another gave an account of the descent of the great goddess Ista to Hades. These were both parts of a continuous poem which had reference to the adventure of an ancient hero—a Babylonian Herakles—whose name was Isdubar, King of Erech, whom some identified with the Biblical Nimrod, who reigned over a city of the same name. The poem contained passages of true poetry. It introduced us to the Babylonian Pantheon in a very vivid and striking manner, and it afforded much insight into the derivation of Greek myths and legendary personages, giving some curious parallels to what we found in Homer. We have in this epic, so far as we can make it out, a powerful and interesting work, containing forcible situations and a good deal of powerful poetry. It is still incomplete, but we are getting fresh light thrown upon it every day, and as fresh tablets are being discovered he hoped soon to have the poem in its entirety.

M. HIPPOLYTE LAZERGES, the distinguished French artist, has just died at the age of 70 years. Since 1841 he had been a regular contributor to the Salon exhibitions, his chief works being sacred subjects. His "Death of the Virgin," painted for the Chapel of the Tuilleries, and exhibited in 1867, was widely noted. The most important of M. Lazerges' later works are the following:—"Ecce Homo," 1885; "Susannah at the Bath," 1857; "Jesus Embracing the Cross," 1859; "The Dance of Assouans," 1861; "Christ Praying for His Persecutors," 1864; "Mary Magdalene first beholding the Lord," 1867; "The Way to Calvary," 1870; "Eve," 1872; "Christ in the Nineteenth Century," 1873; "Stabat Mater," 1874; "Louis XVI. and Marie Antoinette at Versailles," 1875; and "The Caravan of Kabyles," 1876. The "Foyer of the Odéon Theatre on a First Night" contained portraits of the most celebrated Frenchmen of the day.

CHIPS.

The Bishop of London will consecrate St. Cuthbert's Church, Philbeach-gardens, Kensington, which is thought by many to be one of Mr. Gough's most masterly and original designs, on the 14th inst. We shall give a full description of the church on a future occasion.

Messrs. Hayward Tyler and Co.'s steam pumps have been awarded the First Order of Merit, being the highest award at the Adelaide Jubilee Exhibition.

Mr. John Evans, who has been for many years the chief working manager of Lord Penrhyn's extensive slate quarries at Bethesda, has severed his connection with these quarries.

The Manchester corporation have purchased from their autumn exhibition, for the permanent collection at the Royal Institution, the following pictures:—"A Thorn amidst the Roses," James Sant, R.A., £636; and "Across the Forest," £105, Eyre Walker, R.W.S.

St. Peter's Church, Cornhill, is being restored from plans by Mr. E. Flint. Messrs. Phillips and Bisiker, of Leadenhall-street, are the contractors.

The committee who are arranging for a memorial to the late Rt. Hon. W. E. Forster, have intrusted the execution of both the monument in Westminster Abbey (which will be placed within the space occupied by the monument to Mr. Forster's uncle, the late Sir T. F. Buxton), and the statue to Mr. H. Richard Pinker. Mr. Pinker is now engaged in preparing sketches for the statue, which will be of bronze, and the site for which in London will shortly be determined.

St. David's Church, Glasgow, locally known as the "Ram's Horn Church," was reopened after restoration on Sunday, when the Lord Provost, city magistrates, and council attended officially. The side galleries have been removed, and the lancet lights throughout the building have been filled with stained glass.

The Bishop of Rochester unveiled, on Monday, a stained-glass window, typical of "Scenes in the Life of Our Saviour," which has been erected at the west end of St. Paul's Church, Lorrimore-square, Walworth, in memory of the Rev. Evelyn F. Alexander, late vicar of that parish, who died in February last.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW). — Association of Public Sanitary Inspectors. Annual Address by Hugh Alexander, Chairman of Council, Westminster Town Hall. 6 p.m.

MONDAY.—Royal Institute of British Architects. Opening meeting. Address by the President, E. I'Anson. 8 p.m.
Society of Engineers. "Primary Batteries for Illuminating Purposes," by Perry F. Nursey. 7.30 p.m.

TUESDAY.—Institution of Civil Engineers. Address by the President, G. B. Bruce. 8 p.m.

CHIPS.

The committee charged with the erection of a technical college at Dewsbury have decided to take steps for the erection of a building to cost £6,000, exclusive of site, and to be capable of further extension.

The movement for the registration of plumbers is assuming practical form in Manchester. Mr. John Holden, F.R.I.B.A., of that city has been appointed chairman of the local council, with Mr. M. Ingram as deputy-chairman, Mr. W. Jaffrey as treasurer, and Mr. Fred Scott as secretary and registrar. A sub-committee on which both masters and operatives are elected is at present engaged in the task of collecting information and drafting rules.

On the occasion of the dedication of the new reredos and the completion of the east end of the Cathedral Church of St. Nicholas, Newcastle-on-Tyne, festival services are to be held. There will be a week of services, beginning on Sunday, Nov. 13th, and ending on Sunday, Nov. 20th, in which the Archbishop of York and the Bishops of Durham, Newcastle, Carlisle, Southwell, Liverpool, and Sodor and Man will take part. The works were described in our issue of the 21st ult., p. 607, and we shall illustrate the choir, showing the new stalls and bishop's throne, next week. Mr. R. J. Johnson, F.S.A., of Newcastle, is the architect; and Mr. J. Sherwood Westmacott the sculptor.

The Prince of Wales laid, on Wednesday, the foundation-stone of the church of All Saints, at Falmouth. It is being built on a site given by the Earl of Kimberley, situated on high ground at the top of Killigrew-road. It is arranged to accommodate about 700 persons, and will cost about £6,000. Mr. John D. Sedding, of London, is the architect.

The second section of the Roman Catholic Church of the Sacred Heart in Norton-road, Hove, Brighton, has just been opened. The church is 14th-century Gothic in character, and, as completed, seats 450 persons. Mr. Joseph S. Hansom, of Palace Gardens-terrace, Kensington, is the architect; Messrs. R. and E. Evans, of Peckham, S.E., are the builders; the clerk of works was Mr. J. W. W. Randle, and the foreman was Mr. C. Cole. The carving of the church, with the exception of that of the altar and pulpit, has been done by Messrs. Bolton, of Cheltenham, and the grills, brass gates, and gas fittings have been supplied by Messrs. Starkie, Gardner and Co. of London.

The parish church of Doddinghurst, near Brentwood, which has been completely restored at a cost of £2,500, was reopened on Tuesday.

Major-General Carey, R.E., one of the inspectors to the Local Government Board, has opened an inquiry at Clifden, near Manchester, into the application of the Barton Rural Sanitary Authority, to borrow £750 for the sewering of Back Manchester-road, Berry-street, with other streets in that township. The authority have just completed a system of main drainage for the township of Clifton, and they now seek powers to divert the street drains into the main sewer. The plans prepared of the proposed work were submitted by Mr. C. C. Hooley, C.E., surveyor to the authority. The inspector after proceeded to Urmston, where a second inquiry was held into a proposal of the same authority to borrow £550 for the sewering and forming Lily-street, Urmston.

At the invitation of Mr. Bridgman (Chairman of the Law and City Courts Committee), the Lord Chancellor has consented to lay the foundation stone of the New City of London Court on Wednesday, the 23rd inst.

Mr. Ernest George is exhibiting at the rooms of the Fine Art Society a collection of some three hundred of his admirable water-colour drawings.

A correspondent signing himself "G." says in the last edition of Rickman's "Gothic Architecture," p. 259, the illustrations of bays of Canterbury and Winchester Cathedrals have been wrongly transposed. The first one represents a bay of Canterbury, and the second a bay of the nave of Winchester. It may be of interest to call attention to the error, so that it may be corrected by Messrs. Parker in the next edition.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

Holloway's Pills.—These famous Pills purify the blood, and act most soothingly on the liver, stomach, bowels, and kidneys—the great mainsprings of life. They are wonderfully efficacious in all ailments incidental to females. To the emigrant, traveller, soldier, and sailor, they will be found invaluable in the time of need.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

NORTH'S IRON BUILDINGS AND ROOFING.

Kitchen, Parlour, and Bedroom, £21; 13 by 26, £25; 12 by 33, £37; from Railway Works. SALE or HIRE. Some 1s. Sheets. IRON CISTERNS, all sizes.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ARMLEY.—For eight houses (in two blocks), for Mr. C. Stott, at Armley. Mr. F. W. Rhodes, architect:—

Brick and mason (labour only):—			
Barrass, W., New Wortley	£160	0	0
Joiner:—			
Blackburn, J., Armley	290	0	0
Plumber:—			
Crowther, C., Leeds	98	0	0
Slater:—			
Atkinson, J., and Son, Leeds ...	42	18	0
Painter:—			
Green, G. H., Leeds	13	0	0
Plasterer:—			
Haddock, W. J., Armley	75	18	0

ARMLEY.—For six houses, Armley, Leeds, for Mr. J. Blackburn. Mr. F. W. Rhodes, architect:—

Brickwork (labour only):—			
Haddon and Hutton, Leeds	£78	0	0
Plumber:—			
Crowther, C., Leeds	72	0	0
Plasterer:—			
Pearson, J., Leeds	54	10	0
Slater:—			
Pickles Bros., Leeds	28	12	0

ARMLEY.—For eight houses at Armley, for Mr. J. W. Waker. Mr. F. W. Rhodes, architect:—

Richardson, S., Leeds	£420	0	0

BIRMINGHAM.—For forming, sewering, kerbing, guttering, and paving New-street, from Bracebridge-street to Aston Brook-street. Mr. A. H. Hamblin, Temple-street, architect and surveyor:—
Currall and Lewis (accepted).

BICESTER.—For the erection of new Salvation Army Barracks, for General Booth. Mr. E. J. Sherwood, 101 Queen Victoria-street, E.C., architect:—

Grimsley and Son, Bicester	£500	0	0
Coxhead, Leytonstone	444	0	0

CANTERBURY.—For covering in the Shambles, for the city council:—

	A.	B.	C.
Hodgson, Canterbury—	£391 0 0	£426 10 0	—
Martin, Ramsgate—	375 0 0	—	£335 0 0
Jukes, Coulson, and Co., Bromley-by-Bow—	356 0 0	386 0 0	—
Wiltshire, G., Canterbury (accepted)—	360 0 0	395 0 0	—

A.—Ordinary glazing. B.—Rendle's system.
C.—Helliwell's system.

CEFN, NORTH WALES.—For the erection of new Salvation Army Barracks, for General Booth. Mr. E. J. Sherwood, 101, Queen Victoria-street, E.C., architect:—

Weale and Co., Ludlow	£458	0	0

CLAPTON.—For the erection of a temporary exhibition building, for General Booth. Mr. E. J. Sherwood, 101, Queen Victoria-street, E.C., architect:—

Willesdon Paper Co. (accepted) ...	£151	0	0

CLEVEDON, SOMERSET.—For alterations and additions to premises known as Glendale, for the Rev. J. S. Newmann. Messrs. Barker and Cross, architects:—

Elston, Clevedon	£538	18	0
Hardwidge and Tanner, Clevedon ...	483	10	0
Dowland, Easton	485	0	0
Hill, Clevedon (accepted)	444	11	11

COLNBROOK.—For the erection of new Salvation Army Barracks at Colnbrook, for General Booth:—
Young, Slough (accepted).

EAST GRINSTEAD.—For board room, offices, and surveyor's residence, for the East Grinstead Local Board. Mr. W. N. Martin, Wimbledon, architect. Quantities by the architect:—

Longley, J., Crowley	£911	0	0
Cardos, J.	888	0	0
Foster, A.	852	15	6
Pink, R., Godalming	847	0	0
Criswell and Chitty	837	17	0
Pledge, W.	789	14	4

A.—Engine builder's design. B.—Borough surveyor's design and specification.

LIVERPOOL.—For the borings required in connection with the crossing of the river Weaver by the Vyrnwy Aqueduct, for the city council :—
Timmins, E., Runcorn (accepted).

LIVERPOOL.—For additions and alterations to the west wing of the City Hospital, Netherfield-road, for the city council :—
Morrison and Sons (accepted) ... £2 937 0 0

LIVERPOOL.—For the erection and completion of the new wholesale fish market and the first section of the retail fish market, for the city council :—
Morrison and Sons (accepted) ... £18,145 0 0

LAMBETH.—For the erection of a new library, for the Lambeth Libraries Commissioners, in the South Lambeth-road, and presented to them by Mr. H. Tate, J.P. Mr. S. R. J. Smith, A.R.I.B.A., 15, York Buildings, Adelphi, W.C., architect :—

	Portland Stone Dressings.	Doulton Stone Dressings.	Fittings.
Candler—

LONDON.—For carrying out the following works, for the London School Board :—

Chelsea (Beethoven-street).—For forming additional windows :—

Pardoe and Son	£39 0 0
Cowley and Drake	29 10 0
Oldrey, W., and Co.	25 0 0

West Lambeth (Eltringham-street).—For erecting kindergarten gallery :—

Walkley, H.	49 10 0
Dowling, T.	48 0 0
Lascelles, W. H., and Co.	45 0 0
Hammer, G. M., and Co.	43 10 0
Cruwys, T.	39 0 0

West Lambeth (Walnut Tree-walk).—For erecting sliding glass partitions in boys' and girls' departments :—

Mallett, H.	82 10 0
Lathey Bros.	82 10 0
Holloway Bros.	71 10 0
Nightingale, B. E.	63 10 0

Marylebone (Haverstock Hill).—For providing stepped flooring :—

Davis Bros.	42 0 0
Sarjeant, E. H.	39 0 0
Vincent, H. and F.	34 0 0
Pratt, W.	28 9 6
Cruwys, T.	27 18 6

Board Offices.—For new boiler :—

Crane, R.	156 10 0
Cannon, W. G.	144 10 0
Heathman, J. H., and Co.	143 0 0
Longden and Co.	103 12 6
Russell, B.	96 0 0
Rosser and Russell	93 10 0
Fraser and Fraser	88 10 0

(Lowest tender accepted in each case.)

LONDON, S.W.—For alterations and additions to the Rising Sun, Bridge-road, Battersea, S.W., for Mr. G. Sansom. Mr. H. I. Newton, 17, Queen Anne's-gate, Westminster, S.W., architect :—

Gill	£927 0 0
Godden, S.	875 0 0
Lamble, S. R.	860 0 0
Burman and Son	835 0 0
Fincher	815 0 0
Walker, J., Poplar (accepted) ...	760 0 0

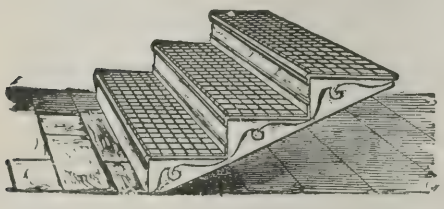
Pewterer, &c :—

Kemble, R.	120 0 0
Davidson, J.	112 5 0
Saunders and Son	107 14 0
Heath, Goswell-road (accepted) ...	103 0 0

LONDON.—For rebuilding Nos. 43 and 45, Great Titchfield-street, and Nos. 1 and 1a, Little Titchfield-street, W., for Mr. W. M. Verney. Mr. W. J. Miller, architect. Quantities by Messrs. J. and A. E. Bull :—

Perkins...	£3,967 0 0
Oldrey and Co.	3,958 0 0
Simpson and Son	3,926 0 0
Colls and Son	3,795 0 0
Bywaters	3,576 0 0
Patman and Fotheringham ...	3,473 0 0

MAIDSTONE.—For taking down and rebuilding warehouse, at Bridge Wharf, Undercliffe, Maidstone, for Mr. W. Taylor. Messrs. Ruck, Son, and Smith, architects. Quantities supplied :—



Cox Bros.	£1,249 0 0
Vaughan, E.	1,222 0 0
Pryer, A. N., and Co.	1,192 10 0
Elmore, T.	1,177 17 6
Wilkins, E., Losse	1,164 10 0
Wallis and Clements (accepted) ...	1,099 0 0
Rest of Maidstone.	

PUTNEY.—For altering Nos. 6 and 7, Salisbury-pavement, High-street, Putney, for the London and County Banking Co., new branch bank. Messrs. T. and W. Stone, 2, Great Winchester-street, E.C., architects :—

	Corncockle Stone.	Portland Cement.
Gregar, W.—		
	£1,820 0 0 ...	£1,695 0 0

Avis and Co. (accepted)—		
	1,099 0 0 ...	989 0 0

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1714.
FRIDAY, NOVEMBER 11, 1887.

OPTICAL REFINEMENTS IN ARCHITECTURE.

MANY architects look upon all refinements of line and curve as so much waste time, and would as soon think of referring to the original Latin of Vitruvius for rules in proportioning their rooms, as to consult and apply the corrections of the Parthenon to their buildings. In sketching out his design to a small scale on a sheet of Whatman's drawing paper, the architect does so without any further thought than to produce a convenient plan, or a well-grouped elevation. Any infinitesimal correction to the straight line, or entasis would be inappreciable to the naked eye on the surface of paper, the inequalities of which would render it worthless; nor does he take much trouble in the proportions of his rooms so long as they look right and fit well. If such refinements are to be made, they should be shown in large drawings, or set out to the full size on the works by proper rules and other instruments. The task is laborious and troublesome, and contract prices are little in sympathy with such niceties of adjustment. Even of the more practicable mode of adopting certain ratios and proportions, the architect does not avail himself very much, and he takes heart in his carelessness about such things by the opinions of leading architects who have found, as the late Mr. Sydney Smirke, R.A., once observed, that there are pleasing effects producible by the adoption of such widely different proportions that he was incredulous of all these theories. That able and learned architect pointed out once in a paper that rooms of admitted beauty are to be found of almost every geometrical shape—even the circular doomed interior of the Roman Pantheon, and the octagon tribune which contains the Venus di Medici, of Florence, are both considered beautiful interiors. Even square rooms were shown to be beautiful sometimes, and a triple cube, like the Sistine Chapel, has as much to recommend it as a room of the Vitruvian double cube. Beauty in form cannot be reduced to a formula founded upon geometry or musical affinities. If it were, architecture would be reduced to a mathematical art which everybody could apply. Without any doubt beauty resides in a variety of forms, which are appropriate and fitted for their purpose; a square cubical room or an octagon apartment would be monstrous and ugly as a sitting-room; for a vestibule or ante-room, having a centre fountain or statue, either form may be beautiful. Optical refinements may be carried too far in these practical days; but we do not believe an architect is fully competent in his art who ignores them on every occasion, and will not admit that a long, horizontal line, such as a girder or beam in a ceiling, has a weak, sagging appearance, especially when there are any contrasting lines near it, as a slightly cambered or segmental ceiling. Anyone who will deny that he sees any weakness in a curved roof or ceiling with a straight tie-beam, or assert that the angles formed by the walls of a room, and a rigidly straight ceiling, look exactly what they—as right angles, must possess a natural defect in his vision, and is, so to say, "form-blind." We do not say that every horizontal beam—such as an entablature supported by columns at intervals—ought to be "corrected" by the application of a parabolic curve, or that every stringcourse and cornice should be arranged to curve or bend upwards; but we contend that these refinements ought to be made in interiors wherever the lines are long, and contrasting lines and surfaces occur in juxtaposition; that they are, in truth, applying precisely the same principle of correction as the colourist or decorator would apply when he takes care to juxtapose two colours or shades which shall be complementary to or harmonise with each other.

It is painful to witness in modern buildings a perfect ignoring of these principles of design. We go into a public hall or concert-room, and take our seat; the flat coffered ceiling appears to be literally bending or falling upon our heads. To make the impression still more apparent, the architect has introduced a circular or flatly-curved arch over the orchestral recess. If the ceiling is a flat curve, as it often is, the trusses are, perhaps, brought down below and encased, their lower edges being made perfectly horizontal, the two lines serving to increase the difference between them; in other words, to make the trusses look as if they were deflecting. Take another example: We enter a church that has a lofty nave, with side aisles, and spanned by a chancel arch. Lower down, at its sides, abut flat, segmental-pointed arches opening into chancel aisles. The lofty piers against which these three arches abut invariably look thrown back or distorted at the springing of the chancel arch; the vertical lines of the piers appear crooked. The cause of the optical illusion can be easily explained. The large arch curves contrast at the springing with the vertical pier lines and cause them to appear pushed out of the perpendicular, and this is intensified, the flatter and more sudden the springing curves are—the angle made looks sharper; the aisle arches, on the same principle, cause the piers to bend inwards at the junction and a distorted effect is produced. The high walls of the nave also appear to be thrust out by a flat, curved, or straight roof. It is only by opposite contrasts that the vertical lines of pillars retain their apparent straightness as in the abutting arches of the arcade.

These and other effects of contrasted lines have been fully discussed in some articles upon "Optical Correction in Design" in the BUILDING NEWS, which appeared in Vol. XVII. for 1869 (pages 123, 302, &c.), in which the author has called attention to several distinct kinds of illusion. To these articles we refer the reader. It is strange that so few works have been written on the subject. Mr. Penrose's learned work on the "Optical Refinements of Greek Architecture" dealt chiefly with the corrections formed in the Greek Temples, and notably those of the Parthenon; Mr. Pennethorne's work on "Ancient Geometry" ought also to be noticed in this connection. The modern architect may be too busy and practical-minded to care to examine minutely the investigated horizontal curved lines discovered in the Parthenon; but he should, if necessary, be ready to apply a similar method of curvature to any long, straight, horizontal lines with which he has to deal. There are other kinds of refinement which are equally important, and can be as readily applied. Mr. Pennethorne some years ago showed that the masses of the temples of Athens and Rome were designed on perspective principles — that is to say, the masses and many of the details were designed as they were intended to be viewed. The point of sight was always before the architect—that is to say, he studied the effect of his entablatures, abaci, and other masses of details from points of view that were likely to be frequented. It is well known that the various sections through the Doric capitals, the mouldings, and other parts of Athenian buildings, were composed of different arcs of the conic sections. Mr. Pennethorne says that the Greek entablature is perspectively proportioned and arranged to suit the given points of sight thus: The apparent height of entablature is measured in seconds upon the arc of a great circle. "Then, dividing this whole apparent height into some given number of aliquot parts, measured also in seconds, the apparent height of the architrave, of the freize and cornice will, in each case, be a multiple of this given modulus. Again, by dividing the first modulus into a given number of apparent aliquot parts, a second modulus is obtained, by which the apparent heights of all the details of the cornice of architrave and frieze will be regulated, and the true lineal heights are then all determined by trigonometrical calculations." In short, all the visible heights of features are, upon this principle, regulated from a given point, the real elevational height of each part being afterwards found. This system of proportion would probably entail too much labour upon the architect to work out with any accuracy, and may be looked upon as chimerical. But we see instances every day of positive ignorance of these principles, especially in the designing of mouldings, projecting features, and towers. If the architect is too impatient to make nice corrections in the manner we have pointed out, he ought at least to take the trouble necessary to regulate his heights and masses before inking-in his elevations. Sketching-in perspective is a valuable auxiliary in designing roughly the masses of a building; but some more accurate method is required in perspectively setting out the heights of stories, entablatures, parapets, towers, and other features. This can only be done by adjusting all heights from a given point of sight, or upon the arc of a circle described from the said point. An elevation is misleading, as every architect knows who has suffered disappointment after the building is finished; it only gives vertical heights, which may be very much curtailed or foreshortened in the actual view of the building from the opposite side of the street, for example. It will be said that the result of this system is to ignore actual heights of stories, and to give to upper features and towers or roofs, especially those at a distance from the façade, a fictitious elevation when the point of view is near. Not necessarily. The system can be applied only to those features that belong to the façade, or be made to include other planes more or less distant. If a dome in a quadrangular planned building is to be made a feature in the view, its tambour should be raised; other features would be stilted; whereas, if designed on the principle of the elevation, as if the eye were on the level of every sucessive stage in the height, we know how purposeless these features become. Wren, in his design of St. Paul's Cathedral, it is very obvious, studied the contracted area of the site and its surrounding streets in raising his dome to the height it now is. Were it to have been proportioned in height from the elevation, the dome would have almost disappeared from view in the streets surrounding. In many other of our cathedrals we find the same regard for increased height of tower; in others, as at Winchester and Peterborough, the tower is lost sight of behind the advancing western arm of the church. Both the distant and near view have to be consulted, and a compromise made that shall satisfy the eye. In the same class of optical correction may be mentioned several other defects. A very common instance of the want of perspective designing is to be met with in buildings whose cornices cut off a large portion of the blocking course and parapet from near points of view. In some buildings we find they are practically lost to view—a good reason for curtailing the projection of cornices in narrow streets. So also with the design of capitals and windows. The stilting of the arches is desirable to correct the effect where the pillars are high. In the design of mouldings above the eye architects often err

in not studying the effect of the members, or how some of them may be entirely lost when viewed from the ground level. Many towers and spires have been spoilt by designing them in elevation instead of at the angle. In broach spires we find a want of care in one particular above others. The broach is designed on the level; the hips of the broach are made to look gentle in elevation; but when raised above the eye 60 or 100ft. they become so depressed as to give a very ungraceful and abrupt springing to the spire. The mistake committed in this instance is the taking of the hip line of each angle broach from the elevation instead of diagonally—in short, taking one side of a square instead of the diagonal. The mistake is intensified when the angle of the hip is seen considerably below, and therefore foreshortened by perspective. The same defect occurs when the angles of hips of a pyramidal roof to a tower are designed as seen opposite a face instead of anglewise; and in designing square towers the diagonal view, as well as the side, should be attended to. It is needless to multiply instances which every practical architect must have experienced in the course of his work. One more example. We may instance the want of entasis to spires and columns. Everyone who has a critical sense of vision must have observed the apparent weakness there is in a spire that has perfectly straight sides, when compared with one which has been entasised, and the same with all columns; here also the method to insure the correction can be easily applied. The more important of these refinements are capable of being made at the initial stage of design, without recourse to decimals of two or three removes from the decimal point, or to mathematical calculations.

DUDLEY GALLERY IMPERIAL ART SOCIETY.

THE winter exhibition of oil pictures in the Dudley Gallery, Egyptian Hall, Piccadilly, appears under more favourable circumstances; as in another instance, the committee have reduced the number of pictures, placing them in more favourable positions for inspection, and setting them off by draping the upper part of the gallery. There is even now a great deal that is commonplace on the walls. Among the better pictures, the hunting scene, "Perfect Bliss," by Edgar Giberne, is truthful in natural colour and handling. The Hon. Stephen Coleridge's "The Avon at Stratford" is fresh and clear, and the studies by C. H. H. Macartney, "Wet Sands" (10), and his fine coast scene near Tintagel (109), are full of sunlight and atmosphere. The breaking waves, as they roll upon the sands, and the warm sandstone rock, lashed by the blue sea in the second picture, are painted with much feeling. A nice piece of impressionism is to be found in Edith Œ. Somerville's "Late in the Gloaming" (11)—very simple and truthful in colour. Another lady artist, Fanny Moody (13), sends an amusing row of pups, "We are Seven." Alfred de Bréanski is at home in Welsh scenery; his "Llyn Tregennen" is irradiant with the gleam of sunshine. There is also careful handling in his view of "The Pool, Burnham Beeches"—an effective study of woodland. Gustave de Bréanski (15), in his "Fishing-boats Seeking Harbour," shows a masterly knowledge of the sea; the atmosphere and colouring are excellent. "A Cornish Pilchard Fleet" (25) is equally truthful, and redolent of the waves. "Near Matley Wood, New Forest" (18), by F. Golden Short, and Kenneth Mackenzie's "From Surrey's Heights" (19)—a wide expanse of wooded country from a sandy ridge of hills—are both landscapes of merit. T. K. Pelham, a new member, has shown his capabilities in two works. "A Gift for the Convent" is a pleasing figure study, in which there is some feeling. Lucien Doucet, a member of the Paris Salon, exhibits "Une Parisienne" (27), a dark face in a black hat, full of expression in the eyes. We may speak commendably of "The Sphinx at Sunrise" (32), by William Logsdail; "Cosy Quarters," by Valentine Garland, a new member; H. H. Couldery's study, kitten and strawberries (39); and Egerton B. Coghill's "An Impression"—a feelingly-painted bit of sea with pierhead, the sunlight reflection and dark piles making a study of contrast. A. Helcké has also a freshly-painted piece of moorland (43), and Sir Joscelyn Coghill, Bart., sends sketches of Castle Townshend (45 and 48); but his study of an old naval officer—"A Maritime Authority"—with his glass; and the large picture, "The Compact"—an incident from Goethe in "Faust" (118)—are not without character and dramatic interest.

"Plutarch's Lives" (104), by J. Henry Smith, is a large figure composition in which there is some power, and good drawing, and colour in the figures. Beneath is a delicate piece of finished execution by Jessica Hayllar (101) in her daintiest style. Another of the figure subjects is Lucien Davis's "The End of the Race"—a party of young, hilarious girls playing at hoop racing. Two of them are near the winning post, the one who is in first smilingly turning to her competitor in the race. With the exception of the rather waxy-looking dog, the figures are well painted, and the painter has succeeded in giving the idea of movement and merriment. Edith Œ. Somerville's "Retrospect" is in contrast—an aged woman of the peasant class before her toilet table, almost French in style, though somewhat hard. In the centre of the room hangs a masterly picture of a woodland glade through which a brook runs—"Belgian Beech Woods"—(65), by W. Rupert Stevens. The wood is thick with foliage, through which the light gleams. There is depth of tone and feeling in the work. Sydney S. Morrish has also a charming view on the South Devon coast, in which the effect of mist and sunlight is cleverly rendered. "She's all my Fancy painted Her," by Regniald Barker, is certainly an ideal—if we may call it—angelic face, but the shoulders and neck are faulty. A small picture, a group of figures (92), entitled, "Primrose Day on the South Coast," by Chas. E. Tucker, is more pleasing as a composition and a study of bright, sunny colour, such as one might see at Hastings than as a finished work of *genre*. The artist has evidently ignored conventional rules, and has given us an impression. A large effective seascape, "White Horses," by Walter J. Shaw, hangs in a prominent place. The wave motion, colour, and sunlit effect are ably rendered. "A moonlight Coast Scene," by Christopher Rummelhoff (99), in its greyness of tone and nice colour is one of the few clever impressions of light and shade. Jessica Hayllar has a finished *bon bouche* (101); the "Roses," by Herbert Dalziel, are nice, though the black ground is disagreeable. "Hedge Roses," by Emily A. Cook (107), is another flower study delicately handled. A few small pieces, "Evening," "Toilers," and "Wanderers," by V. De Ville (116, 120, 121)"; a charming little bit of woodland, a poem of colour, by James G. Grace, are redeeming works on this wall. De Ville is a new member, and his pictures, especially the gipsies on the side of track on a lonely heath or common (121), and the "Toilers" are full of nice sentiment, and are promising studies. A. Helcké's atmosphere (in 127) and E. Blount Smith's "End of September" are also studies of merit. Oliver Baker's "An Old Inn Yard" wants depth of shadow to make an interesting picture; his "Mill Pond" (125) shows some good work. Blanche Macarthur's "No Rose Without a Thorn" is delicately handled in parts; and a large, solidly-painted landscape (139), "Now Fades the Glimmering Landscape on the Sight," by Byron Cooper, may be mentioned before leaving the exhibition.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the 53rd session of the Institute was held on Monday evening, the President, Mr. Edward I'Anson, in the chair.

The SECRETARY mentioned that among other donations to the library was a portfolio containing fifty sketches by the late Mr. George Devey, presented by his executors.

Mr. RALPH NEVILL, F.S.A., called attention to the wretched lighting of the library by argand gas burners, a form of light which he characterised as combining the maximum consumption of gas for a given light with the greatest amount of heat and deleterious products; it rendered the atmosphere stifling and unwholesome, and besides making study irksome to readers, had an injurious effect on the bindings. He supposed an electric light installation was out of the question; but the Welsbach gas light was beautifully white, threw out little heat, had no deleterious productions, and it was inexpensive, a single light being fitted for 15s., and against this outlay was the reduced consumption of gas.

The PRESIDENT replied that if Mr. Nevill would write to the Council, his suggestions should receive consideration.

The following 24 gentlemen were elected to membership:—As Fellows: Joseph Clarkson Maddison, Hereford-street, Christchurch, Canterbury, N.Z.; William Henry Powell, Associate, 6, Southampton-street, Bloomsbury, W.C.; James Jerman, Associate, 33, Paul-street, Exeter; Thomas Meakin Lockwood, 80, Foregate-street, Chester; and Arthur Hill, Associate, 22, Georges-street, Cork. As Associates: Henry Thomas Gradon, 40, Sadler-street, Durham; Richard Matthew Dudley Fell, 53, Bernard-street, Russell-square, W.C.; Henry Hoyne Fox, H.M. Indian P.W.D., Burmah; George Cade Smith, 24, Ivy-road, Gosforth, Newcastle; Charles John Marshall, 115, Ebury-street, S.W.; Edgar Harry Selby, 26, Craven-street, Charing Cross, W.C.; William Henry White, 11, Lawford-road, Camden-road, N.W.; Robert Williams, Holly Bank, Haslemere; Edmund John Bennett, 5, Harmer-street, Gravesend; James William Brooker, 13, Railway-approach, London Bridge, S.E.; Herbert Richard Lloyd, Dresden Villa, Moseley, Birmingham; Frederick William Marks, 21, Harrington-gardens, S. Kensington; James William Stonhold, 65, Stanhope-street, Regent's Park; Hubert Alfred Gregg, 1A, St. Helen's-place, E.C.; Francis Eldred Lodge Harris, 11, Lawford-road, Camden-road, N.W.; Arthur Henry Worsley, 65, Stanhope-street, Regent's Park; Theodore Moore, Whip's Cross, Walthamstow; and Henry Paterson, 77, Wilberforce-road, Finsbury Park. As Hon. Associate: Sir John Coode, K.C.M.G, 5, Westminster Chambers, S.W.

THE OPENING ADDRESS

was then delivered by the PRESIDENT, who, in his introductory remarks, referred with satisfaction to the fact that the Imperial Institute competition had been won by one of their Fellows, Mr. Collcutt, but pointed out that, possibly because their body had sent no subscription to the funds, architecture was unrepresented upon the Executive Council of the Imperial Institute, unless it were considered that the President of the Royal Academy represented architecture as well as painting and sculpture. A fitting work for the Imperial Institute would, he might suggest, be the production of a thorough and complete record—perfect in all its details—of the more important architectural monuments contained in India, and the many historical sites and ruined cities to be found within the various dependencies of Great Britain and Ireland. There was no complete or national work of the kind; and he hoped that there might soon be found means, by the agency of the Imperial Institute, to furnish at least a catalogue of the historical monuments extant within the confines of the British Empire. Having referred to the death of Mr. Beresford-Hope, the second and last non-professional President of the Institute,

Mr. I'Anson passed on to consider the new privileges conferred on the Institute by the Supplemental Charter. The Institute had obtained the right to hold examinations not only within the United Kingdom, but also in any colony or dependency thereof and in' India. They had obtained the right to use distinguishing affixes ; and also power to declare, in the year 1892, that every person desiring to be admitted a Fellow must have passed an examination. (Applause.) Moreover, the examination test which they ventured, in 1882, to impose upon all candidates for the Associateship was now a right which they were empowered to exercise. These, in his opinion, were powers and privileges the possession of which entailed responsibility of a very high character towards the public and towards themselves, and they formed a basis upon which all minor professional questions must rest if any superstructure was to rise out of them. At the triennial conference held in May, one meeting was occupied in considering the subject of professional education, and in the result a series of resolutions was adopted by the meeting, embodying a practical scheme for organising a complete system of progressive examinations. The preliminary examination would test the general knowledge and lead schoolmasters to systematise the studies of the pupil, and to direct his attention in particular to those essential branches of knowledge which the examination would indicate. The intermediate would be for the probationer, a stage at which he would test his elementary architectural knowledge, and in the preparation of which he would lay a solid foundation for his future studies. The final would give him a standard for the development of his studies so as to place him in a position to enter on the active practice of his profession, ready to apply the principles and details he had acquired, and to further pursue his work until fully prepared to enter on that ultimate examination which in a few years might be established as a preliminary qualification for the class of Fellowship. He hoped that when the scheme was matured it might lead to their intrusting the preliminary examinations to local societies, as indicated by Mr. Lawrence Booth. Meanwhile, in the spring of 1888, an examination will be held under the auspices of the Manchester Architectural Society. It had been sought, moreover, to direct the attention of young architects in practice to the obligatory examination which now formed the only entrance to the degree of Associate of the Institute. The number of such architects who would be worthy members of that body, but who had not yet joined its ranks, would, he was convinced, continue to increase, and it could not be too widely known that this examination was framed so as to have regard to the position of architects in actual practice. Indeed, the examiners were in the habit of giving the fullest consideration to the professional status of such candidates. To another of the meetings of the Conference the Council referred the report of the Special Federation Committee, in order to elicit an opinion as to the feasibility or desirability of carrying into effect any or all of the proposals made in that report. The meeting was a thoroughly representative one, and the report was returned, after a few slight modifications, with a request that it might be taken into consideration. This, continued the President, has been partly done, and the matter is now in the hands of a special committee, engaged in the preparation of draft by-laws according to the terms of the Supplemental Charter granted to the Institute in the spring of the current year, and I believe before many weeks are over it will be possible to convene a special general meeting for the purpose of considering the same. Meanwhile, without pledging myself to agree with all the provisions of the report, I may perhaps be allowed to express satisfaction with their general tenour. The Conference of 1887 has resolved that the centre of any federation of the members of the profession within the Empire is and shall be the Royal Institute of British Architects, and the expressed object in view is to establish a closer connection than now exists between British architects generally, so as to promote the advancement of our art, harmony of practice, and intercommunication. For this purpose, roughly speaking, the Institute is to organise periodical conferences in the provinces, as well as in London ; the local societies, which are to retain their identity and name, and the management of their internal affairs, are to adopt the "Schedule of Professional Practice and Charges," sanctioned by the Institute, with a proviso that, so far as may not be inconsistent with the spirit of such schedule, they may arrange terms for the guidance of their own members in circumstances not covered by the schedule ; they are also to afford every practicable assistance to students in preparing for the examination in architecture ; and further, local examinations are to be held, by a society or group of societies, of persons desirous of qualifying for candidature as Associates of the Institute. In return, the Institute is to hand over to the local societies a proportion of the amount received by the Institute in annual subscriptions from their members. These are the main points of the report of our Special Federation Committee, and they seemed to me, as they seemed to the conference meeting which discussed them, quite feasible—indeed, eminently desirable. There are, of course, details, especially of professional practice, which will require care and time to work out and assimilate ; but I trust that both in London and in the provinces the leading men will exercise mutual forbearance while completing the minor arrangements of a scheme likely to benefit the whole profession, and to the success of which I wish a hearty God speed. The consideration of a very important subject —the proposed "Registration" of architects— also took place at the Conference, when, after a lengthy discussion, it was resolved to recommend this question to the careful consideration of your Council. The matter is now before a special committee, who are fairly representative of both town and country. Mr. Connon, of Leeds, has accepted the post of hon. secretary to the committee ; and those who know the energy and ability of this gentleman will not fail to conclude that the work will not be allowed to flag. Gentlemen, this is a very important question. It has been strongly pressed upon us from without. It is also clear that many amongst us think it a right step to take. But the critics will ask—Is it for the good of the public ? Is this movement a disinterested one, or is it not ? Is it to make a trades-union of the profession—(No, no)—to exclude all those who have not been admitted within the inner circle from sharing in the emoluments of those who are within ? Will it really protect and guard the public from incompetent men ? (Hear, hear.) For my part, before venturing upon any conclusion as to the desirability or the reverse of "Registration,"—whatever that term may imply—I think that we may ask ourselves two very apt and pertinent questions : First, as to the form in which the registration of architects may be effected ; and, secondly, whether the fact of having passed those examinations for admission to the Institute, now sanctioned by Royal Charter, and to which I have just referred, will not accomplish—to all intents and purposes, and sufficient for the present time—the main object of registration as contemplated by the Conference of May last. (Applause.) The President then referred to the losses sustained by the deaths of members of the Institute during the past session, including among the Fellows George Devey, George Vulliamy, George Bell, of Glasgow, Thomas Henry Sapsford, of Sydney, Sir Horace Jones, Ambrose Poynter, Robert Parris, George Barnes Williams ; among the Associates, George Goldie, Oswald Adshead, Thomas Farrer, Harry Saxon Snell, Robert A. Frazer, Andrew Edwards, Vincent Wing, and Arthur Harland ; among the Hon. Associates, Major-General Moody ; and from the hon. corresponding members, Ruprich-Robert, Oliver Rayet, and Professor von Neureuther, of Munich. He also alluded to the election of Mr. Blashill to the post of Superintending Architect to the Metropolitan Board of Works, and to the decision of the City Corporation to rescind their recent vote and again include among their officials a City Architect, and to the award of the Royal Gold Medal to Mr. Ewan Christian. Having observed that the exhibition of the students' work, held in the Conduit-street Galleries last January, was one of the best, if not the best, ever hung, Mr. I'Anson announced that the committee of the new British School at Athens had just made a proposal of some importance and interest. They were prepared to contribute £50 towards the expenses of any duly qualified architectural student whom the Council might select to send out to Athens during the session now opened. The conditions attached to the grant were—(1) That the said student should reside at least four months in Greece ; (2) that he should hold himself at the disposal of the director of the school to assist in excavations if required. (Laughter.) Nothing that had transpired during the year had induced a belief that the Institute might be brought more closely into relationship with the Royal Academy. Although, in the early part of the year, it was stated that proposals involving serious modifications in the constitution of that body were being considered by its members, no communication on the subject had been received, and any action that might have been taken by the Academy had been without results as regarded the Institute. On the other hand, an arrangement of some significance had been made between the Architectural Association and the Institute, whereby, during this session, the meeting room would be occupied once a fortnight by the Association, and with the entire concurrence of the members of both bodies. It was a source of extreme gratification to him to know that the mutual assistance long rendered was thus appreciated by both societies in a manner so cordial, and, as the excellent President of the Architectural Association showed in his recent address, so sincere. The aims of both were identical ; they existed for a like purpose. In the Supplemental Charter and its examination clauses, the objects for which both were working had been defined. The Institute, while urging the members of the younger society to maintain their absolute independence, would further the interests of the profession by endeavouring to enlarge the capacities of the Architectural Association as an educational body. Some important questions would come before the members of the Institute this session —namely, the settling of the by-laws to be made under the Supplemental Charter ; the development of the scheme of Federation ; and the consideration of Registration. On another very difficult and vexed question—that of "Light and Air"—a mass of evidence had been collected by a special committee of the Institute, the work of which had been transferred to the Standing Committee for Science, with a view to the framing of some practical suggestions. In conclusion, the President said : A great deal has been written and said of late about the progress of the last fifty years. To many of you I have no doubt that such a period seems a long time, but, believe me, it is barely anything at all in the life of a corporation ; and to everyone, whether he be an old man or a young man, I would say—Do not be in a hurry. It was only last year that the London Colleges of Physicians and of Surgeons combined for educational purposes, and for the furtherance of professional education ; yet the College of Physicians was founded early in the 16th century, and the Surgeons can trace their existence back to the rejgn of Edward II., and even earlier. In 1844, only forty-three years ago, a Charter granted to the surgeons constituted a new order of Fellows—a grade higher than members—who were to qualify for the distinction by strict examination, or by selection from among deserving members. It is unnecessary to tell you the results of that great step ; you will draw your own inferences from the parallel I have ventured to place before you. No class of men have been reviled, even for centuries, with more bitterness, and with more wit, than the physicians and surgeons. They have been assailed with clamour inside and outside their ranks ; they have met with every kind of opposition. Such things, however, do no harm, for, when the cause is good, opposition to it creates no new enemies ; on the contrary, it consolidates old friendships, brings back waverers, and strengthens the ties of interest and duty which unite the members of a sound and flourishing society like that to which you, gentlemen, and I have the advantage to belong.

Mr. A. W. Blomfield, F.S.A., moved that a letter of condolence be sent to the family of the late Mr. Beresford Hope. This was seconded by Mr. Ewan Christian, and unanimously adopted.

Mr. Blomfield afterwards moved a vote of thanks to the President for his very interesting and exhaustive address.

Mr. JOHN SLATER, as representing the Architectural Association, seconded the vote of thanks, and, referring to the recognition of that Association by the Institute, said that anything which made the institution the recognised centre of the life and work of architecture, whether as regarded the Metropolis or the provinces, must be an undoubted good. He quite approved of the introduction of examinations, and, if properly conducted, they would prove, he believed, invaluable in fostering and improving architectural education. They would, he considered, commit a fatal mistake if they attempted to rush through any scheme of Federation or Registration.

PROFESSOR KERR supported the proposition, and referred to the death of Mr. Beresford, Hope, who, he said, was identified with a movement for the advancement of the profession, and with the Renaissance of English Mediæval art.

The vote was unanimously accorded, and briefly acknowledged by the President.

ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting for the present session of the Association was held in the R.I.B.A. meeting room on Friday evening, the President, Mr. John Slater, B.A., in the chair. Mr. T. E. Pryce, secretary, announced that the order of lectures had been changed from that recently published in the syllabus, and that at the next meeting, to be held on the 18th inst., instead of Mr. Baggallay's paper, one would be read by Mr. Herbert D. Appleton, entitled "Suggestions for our Sketching Club." The following seventy gentlemen were elected as members:—G. S. Fleetwood, A. C. Williams, A. H. Knott, P. D. Smith, J. R. Clunis, A. H. Moore, P. A. Grinstead, E. R. Sequira, E. D. Webb, A. C. Walker, J. Peter, G. H. Fox, T. P. Simpson, J. Gethin, F. A. Huntley, A. Corderoy, W. H. Brooks, E. Carless, A. T. Pope, R. Scarfe, P. L. Waterhouse, E. G. Angel, E. Oertel, Ernest H. Selby, J. E. Jefferson, B. C. Bailey, E. Carter, C. E. Gray, A. P. Cocks, C. H. Strange, W. H. Winder, W. M. Paton, E. Archer, A. Gladding, H. G. Robins, F. J. Waller, A. C. Henderson, J. F. Parker, H. Rice, F. H. Greenaway, H. N. Smith, C. N. Johnson, E. W. Wonnacott, F. T. White, H. B. Young, J. T. Masters, J. G. Whyte, G. L. Orme, H. W. R. Ormefield, C. H. Cheston, A. Field, A. J. Jackson, F. T. Davys, C. W. Riches, T. P. Clarkson, A. T. Griffith, S. F. Bartleet, A. E. Habershon, M. A. Green, P. G. Eade, W. G. Ingram, C. A. B. Smith, W. J. Roome, A. M. Wakley, J. Angold, D. Gibson, F. E. Hollinworth, E. H. Hill, R. B. Lindsey, and A. T. Walmsley. Eighteen nominations for membership were also read. The next business was the election of a member of committee in the place of Mr. E. Guy Dawber, resigned. The committee, acting on the principle hitherto adopted of appointing the highest unsuccessful candidate at the annual election, had nominated Mr. P. J. Marvin; but certain members of the general body considered that Mr. Marvin was already eligible to act on the committee under Rule 22 as the representative of a class, and Mr. W. J. Leverton was therefore nominated by Messrs. A. O. Colland and Max Clarke. The President, having been appealed to, said Rule 22 was ambiguously worded; but the intention and practice was not to make representatives of all the classes *ex officio* members of committee, as they would swamp the elected members. On the vote being taken, Mr. Marvin was elected by 54 to 43 votes.

ARCHITECTURAL MODELLING.

Mr. J. C. L. SPARKES read the following paper on this subject:—

My topic is not usually regarded as one of the first importance in the education of the young architect; but is, nevertheless, of the deepest interest to him and his future clients. It is the light and shade of his building; and in assuming that the practice or the art of modelling can help forward this important section of the great art, it enters into the consideration that should be given to every touch on a building that involves light and shade, which is no less than every particle of relief that is used as ornamentation of the structure. Now, the modelled decoration of a single abstract is simple enough, and we see in many competitions that are annually held that it is a question that deals with the systematic, orderly, and pleasant distribution of various details, natural or conventional, in high or low or flattest possible relief; but who can say more than that, in itself, the panel, as such, is a pleasant object, not offensive by any disproportion of form, light, and shade, or half tone? But the problem is a very different thing when a panel has to be made to take its place among an already distributed arrangement of mouldings or other projections; whether these are the proper attributes of any particular style, or the accidental results of peculiar lighting. Then the panel has to fit its prescribed place, and the prescription of colour that surrounds it must be thoughtfully consulted and studied, that the designer may forward the harmony of the whole mass. This involves a very subtle question—namely, that of the *colour* of a building. I do not mean anything that relates to pigment; but the general tone that the light and shade of the plastic mass produces on the artistic observer. Equally the *colour* of a statue is, of course, not any pigment with which it may have been tinted, but the value in grey that it presents, and a capable sculptor uses his colour with all the taste with which he is gifted to convey his sense of breadth or complexity, light or dark, whichever quality may best explain his meaning. The colour of the hair of a sitter may be represented approximately, the depth of the colour of the eye, or the over-balance of some too heavy shadow may be made right by the proper understanding of this vital principle. Now, colour in a building is much the same as colour in a statue—it requires a large experience; and in architecture as in painting and sculpture demands a refined taste to express a breadth that shall be perfectly harmonious and never bald. Take as an illustration the diametrically different treatment that a panel designed to be exposed on the south façade of a building in full daylight or sunlight should receive, from what must be applied to the same panel if its mission is to decorate a staircase with a narrow top light. So consider the different treatment visible in the Venus of Milo, formed to be seen in the broad light of southern daylight in harmony with the large breadths of simple Classic wall surfaces, and the draped figure of a saint from its position in the overarching porch of a Gothic cathedral. The colour in the two is absolutely opposite; first in the building, and, of necessity, in the details that decorate it. Or take a façade of Bramante and one of a Romanesque building, and the difference is as light to dark—breadth of light to its opposite. The conditions governing every portion of the decoration of these opposite and contrasting works of art are so obvious that no one will take exception to the proposition that follows on—viz., that every detail must be modelled to contribute to the general tone, whether this be in the direction of breadth and light or fretted dark; or, further, that this will demand of the architect a knowledge of effect and a mastery of detail that can only be attained by dealing with each moulding and each relief decoration as a part of a whole, plastic and amenable to each wish or fancy of its author. Light and shade enter into the ultimate treatment of each angle, cornice, surface, and plain, large or small; therefore, all combine to give "colour" to a building. If we accept the truth of this statement, how necessary, then, is it that the young architect should *model*. Colour, then, can consist of the aggregate values of light and shade in its largest significance, and must be studied down to its smallest details. And this involves the consideration of how it is to be done. The historic method—that is, a progressive course of graduated form from Early to Late in any particular style—seems at first sight the most reasonable and satisfactory, so far as mere modelling goes, and is indeed so, if we aim merely to give a clear idea of form, surface treatment, and light and shade of particular parts of any building; and with this in view the student should commence with some rather simple panel, and learn the use of his material from the free imitation of the chosen object, never losing sight of the fact that many beautiful objects, such as those carved in hard stone, wherein the greatest fineness of line is possible and is expressed, are clearly not suitable for copying in clay. In such a case a translation may be made. Or, again, a rough piece of wood-carving, partly sawwork and mainly gauge-work, is not to be imitated in clay; here the careful and capable guidance of a good teacher is necessary. But enough remains for the architect to copy accurately and even servilely. The genius of the material deserves some study. Clay is plastic; it is added piece by piece, layer on layer, until the desired contours are reached. This is the very opposite of a carving, when out of a block the desired contour and figure are cut; and it is sometimes difficult for a student to realise that he must not scrape and carve down a lump of clay to some smaller form. For these reasons the example should be wisely chosen in consonance with the genius of the material. With this in view the architectural student should model not only architectural details, but also the human figure, for in this section of study *colour* will become one of the qualities he will learn to appreciate; and if he should be able to obtain any great power in figure modelling, the question of colour in his work will be constantly before him, and in that case he will not fail to admit its very great importance. As to where this study can be carried on, I call your attention to the isolation that surrounds the average Government Art School. The manufacturer does not, to the full of his requirements or opportunities, use the art school. In many cases the manufacturer is absolutely indifferent, and a condition of isolation undoubtedly often exists between the school of art and the manufacturer. The connecting link is to be found in the secondary, or technical, or advanced, schools of art, where the classes shall be few, with masters who shall be specialists, the best men in their calling, and where the work shall be essentially practical and technical, and carried on to the farthest possible point. The art school has prepared the ground, the technical school sows the particular crop it is desired to raise, and the manufacturer and employer of art labour see their interests are advanced by the excellent teaching their apprentices may obtain in these secondary schools. An important instance of such an extension of art-school work is seen in the Technical Art School at Kennington, which has grown out of the Lambeth School of Art, an institution that, unaided, has done its share of work in helping the local manufactures to a name and an importance that has generally been admitted they have attained. I invite the attention of all interested in this work to this school, where instruction is given by a modeller and sculptor, capable in all the varied sections of architectural decoration, and in figure no less. The entire district is deeply indebted to Mr. William Silver Frith for the work he is doing in the South of London. The clearsightedness of the City and Guilds of London Institute has allowed this absolutely necessary work to be done; and their liberality fully supports one of the most interesting and useful art schools in this city.

Mr. LAWRENCE HARVEY, in proposing a vote of thanks to Mr. Sparkes for his paper, strongly supported his views as to the value of modelling as a training for architects, remarking that in the architectural school at Zurich it was recognised as highly important, and would probably ere long be made an obligatory subject. Unless an architect could say whether a model was correct or not he was a slave to his sculptor and carver. The same design was not equally suitable for execution in marble and in Bath stone; the sharp or blunted arrises characterising the several materials must be taken into account. Mr. Sparkes had emphasised the necessity for a knowledge of "colour" in sculpture, and this simply meant an artistic realisation of the value of light and shade, of plain and roughened surfaces, and of the subtle refinements of the art. In wood carving great technical difficulty was experienced in treating the background surface; but by a recent invention this had been overcome. The device consisted in fixing to the surface of the wood whatever raised ornament was required, as in the mouldings and stiles of a door, for example, and other pieces of wood; these might be of various colours, and then, when the whole was set, the carver could cut, as in cameo work, partly through the several layers of red, yellow, or white wood, and so produce great variety of treatment.

Mr. LEONARD STOKES, in seconding the vote

of thanks, said the value of a knowledge of modelling was very great to the architect, for a model would enable him to realise his building not as a series of elevations built upon a plan, but as a solid mass; it would help the designer to see round the corner of his work in a way that a perspective did not. He did not think that Mr. Harvey's cameo-like process of wood-working was one that recommended itself to architects.

Mr. H. D. APPLETON trusted that modelling would not be added to the accomplishments the well-trained architect was expected to have a thorough mastery of. The argument that it would enable him to correct the carver's work would apply equally to every branch of building, and if they regarded modelling as essential, he ought certainly to practically understand the bricklayers', carpenters', and plumbers' crafts. Professional education was in danger of being made so technical, and in so many directions, that the architect's life would not be worth living. Had Mr. Sparkes any architectural pupils in his modelling classes, and, if so, what were the limits of age?

Mr. FRANK JONES asked if Mr. Sparkes recommended to architects modelling in preference to setting up perspectives of their buildings, or as an accessory or means of realising the effect, or did he intend to restrict it to details.

Mr. E. SWINFEN HARRIS remarked that one reason why the late Mr. George Devey's buildings had always so excellent an effect in execution was because they were all erected from models prepared in wood to a reliable scale. Where clients would consent to this nothing could be more satisfactory, as any errors could be corrected before it was too late.

Mr. W. HAMPDEN PRATT hoped Mr. Sparkes would on a future evening develop his views more fully. He feared one result of the larger use of models for details would be that architects would be tempted to employ ornament too freely, to the destruction of that very reticence in design for which Mr. Sparkes had contended. He should have liked Mr. Sparkes or Mr. Harvey to have definitely explained how they would modify a design for execution severally in plaster, Bath stone, and marble; further, if designs for each material needed to be differently treated, it was not clear how actual modelling in clay or plaster could educate an architect for preparing designs for execution in harder materials. There was a danger, too, that if the architect took all the responsibility of his carved detail, the sculptor would be degraded from an artist who interpreted the design into a mere copyist.

The PRESIDENT, in putting the vote of thanks, which was carried by acclamation, observed that nothing could be of greater educational value to the architectural student than trying to model his buildings, and if the pupil would endeavour to construct his roofs, say, in thin sections of soap, he would fully realise the nature of the problem. The plan of modelling a building to scale in wood was excellent; but most clients would object to the cost, and few architects were so fortunate in their clients as the late Mr. Devey. He hardly thought that different coloured woods should be used as a cameo or sgraffito work, as Mr. Harvey had suggested.

Mr. SPARKES, in acknowledging the vote of thanks, said he had not suggested that the architect ought to make a full model of every building, nor did he anticipate that the average architect would arrive at a great pitch of fame as an original modeller. He thought, however, that that practice in the art of modelling instruction would stimulate their sense of light and shade and colour in sculpture and carved ornament. An archæological or historical knowledge of various details was one thing, but to be able to practically apply them in a building was, all would concede, another. Mr. H. Herkomer's new house at Bushey was an interesting example of an amateur's design worked out by amateurs. It was an artist's, not an architect's, design, but promised when completed to be one of the most picturesque and, perhaps, incongruous buildings yet erected, and one in which the qualities of light and shade would be well worked out. Mr. Herkomer was building from the inside outwards—the furniture was being made before the outer frame of the house was put up. The furniture and walls were being covered with a profusion of 16th century detail, executed by ingenious machinery on the premises, and this he thought to be a weak feature, for the ornament, although faultlessly executed, lacked the genius of handiwork, and was too precise and uniform. In reply to Mr. Appleton, he did not think he ever had an architect's pupil in his modelling classes, and that was, perhaps, one reason why he was addressing them that evening. One result of these classes had been that many of their best workmen had given up carving, for the new light they gained there made them determined to prepare designs for others rather than execute those supplied to them. Although this was not their aim in the school, it evidently tended to send out men with well-developed minds. It had been suggested that a model would be more useful to an architect than making a perspective drawing; but in schools of art it was supposed that an architectural perspective possessed that quality of seeing further round a corner than usual, which had been claimed for the model. If invited he should be pleased to explain his views as to the colour, light and shade which could be given to a building at a greater length on another occasion.

THE INCANDESCENT GAS-LIGHT COMPANY.

AN improvement in gas illumination that is likely to become a serious rival to the electric light has been lately brought into notice by the application of the principle of incandescence to the ordinary gas-burner. The new gas-light, the invention of Dr. Von Welsbach, of Vienna, is being very successfully introduced by the Incandescent Gas-Lighting Company, of 15, Leadenhall-street, who have completed large premises in Palmer-street, Westminster, from the designs and under the superintendence of Mr. W. Macie Leir Seaman, architect, of Albert Gate Mansions. The system of lighting may be described as follows:—Round the flame of a Bunsen gas-burner a tubular wick or hood of carbonised cotton net about 3in. high is placed, the effect of which is to greatly intensify the light by rendering the net incandescent. The process is simple. The "mantle" of net, as it is called, is steeped in a chemical solution containing oxides of the elements of zirconium, lanthanum, and other substances, the secret of which belongs to the Company's patent. The mantle is then ignited till the cotton is burned away, leaving a residuary skeleton of incombustible oxides. The light emitted by this incandescent gauze is perfectly white and steady, and has all the brilliancy of the incandescent electric light. A large percentage of gas is saved, and, what is more important, the illuminating power is doubled, while smoke is entirely consumed in the perfect combustion of the gas. In this respect, indeed, the incandescent light is a boon that all consumers of gas will readily admit after seeing or trying the Welsbach light. The atmosphere is not vitiated, the heat is lessened, and the sooty deposit on ceilings, books, and paper avoided. The burner is extremely simple, cheap, and can be applied to any of the existing gas-fittings. There are two sizes of lamp made, which are very reasonable in price, and are fitted with shades of various patterns. That this gas lamp must ultimately take the place of the common gas-burner we have not the slightest doubt. The Welsbach lamp, compared with an Argand burner, has the advantage of giving a light of 20 candles to one of 16 candles, the consumption of gas per hour being just half of the latter. Compared with the ordinary nipple burners, the saving of gas for the same illuminating power is, at least, 60 to 70 per cent.

The manufacture of the refractory mantles of cotton is quite an art, and is carried on in the new premises of the Incandescent Gas-Light Company in Palmer-street, Westminster. A large number of female hands are employed here, and the labour is light and comparatively easy, as the making and manipulation require considerable delicacy. The processes which the mantles for producing the incandescent light undergo are several. First, we see the knitted fabric or hose made on a kind of stocking machine worked by hand, and resembling in its operation a sewing machine. In another part of the factory the hose so woven is cut into lengths, and the top ends gathered in and threaded with fine wire, this operation forming the mantle; after this the mantles are steeped in a chemical solution, the secret of the patent of the inventor. They are then dried. A room fitted with racks, having glass bars over heating coils and raised to a temperature of 95°, is provided for this purpose. A number of young women are here seen who are engaged in turning round the mantles hung on the glass bars, so as to insure equal drying all round. The saturation and drying of the mantles are twice repeated, the rooms being connected by openings through which the saturated mantles can be passed to the drying room and returned. A further operation is the fitting of the mantles on their stands of wire, and subjecting them to burning in gas jets. The cotton is burned away and the coating remains, which forms the fragile skeleton which produces the incandescence. In another large room is a row of tables and stands of gas jets, upon which the mantles are burned for 2½ hours, at the end of which time the process of incineration is completed, and a residual skeleton of the impregnating solution alone remains. On the ground floor of the factory the burners are packed in boxes for transport, a large store in connection therewith being used for finally disposing of the goods. The building, of three stories, in which these operations are carried on has been fitted up with every convenience. On the upper floor are lavatories and closets, in which Jennings's flush-out closets and lavatory basins are provided. The staircases are of iron, well ventilated and lighted, and over each of the tables where the operations of chemically heating, drying, and burning-off are conducted, are large funnel-shaped tubes for carrying off the fumes and products of combustion. The floors are provided with lifts in connection with the storeroom. Each floor is well-lighted and ventilated by windows, the walls coloured grey, and the whole of the factory presents an appearance of cleanliness and activity. We may add that the new light has been introduced into the General Post Office, the Bank of England, London and Westminster Bank, Royal College of Physicians, several of the large hotels and clubhouses, and some of the leading theatres in London, in addition to the chief newspaper offices, banks, and insurance offices. For offices and domestic dwellings the Incandescent Gas Light Co. are taking large orders, and we are informed are about enlarging their premises to meet the demand upon them.

DRAWINGS BY MR. ERNEST GEORGE.

ALMOST interesting collection of sketches in watercolour is now to be seen at the Fine Art Society's Exhibition, 148, New Bond-street. The present display of drawings by Mr. Ernest George illustrates Rome, Venice, Rouen, Amiens, Bruges, Rotterdam, and many other Continental cities besides London. The sketches are charmingly simple and unlaboured; through the washes of tint the pencil lines are still visible, which give an architectural zest to them. The colouring is wonderfully transparent and rich in tone. Take, for example, the lovely sketches from Amiens, or St. Jacques' apsidal chapels, Dieppe, with their pierced parapets and high roof, or the staircase in sacristy—a fine piece of architectural sketching; or, again, the stone staircase in Rouen Cathedral with its pierced balustrade of rich tracery, bright and stony in effect. Mr. George loves to saunter through the narrow streets and by-ways of Mediæval cities and sleepy villages, picking up here and there some long-forgotten ruin or dwelling. He does not give us the conventional views of the engraver and painter, but takes up subjects which perhaps have never been sketched before, and herein lies the interest of the collection. There is a true poetical feeling in the brilliant views from Venice and the Italian Lakes, such for instance as the Campanile di San Giorgio Maggiore; the Rialto Bridge; a Street in Verona with Campanile. A brick Campanile, Milan, with what looks like the circular baptistery near, in simple washes of grey and red; a fine drawing of the Duomo of Milan showing the pulpit round pier; and several sketches from Como, San Remo, and other places will be admired for their truthfulness. The English drawings include Old Houses at Exeter, Lyme

Regis, and Whitby; some charming views from Cambridge of Clare Bridge and St. John's, with the red brick Elizabethan buildings and bridge over the Cam; Shops, Banbury; a "Row," Yarmouth. The London series, many of which are known to our readers, include the old row of wooden houses in the Strand; Cock and Pye, Drury-lane; St. Bartholomew's, Smithfield; views of St. James's Palace, Lambeth Palace, Battersea Bridge, Holywell-street, Staple's Inn, and many other bits of Old London with which Mr. George's facile pencil has made the public familiar. These picturesque fragments of old-world architecture, yearly disappearing, have a conscientious record in these sketches, which will long survive the originals. As pure watercolour sketches, these drawings deserve a visit, even apart from their archæological interest and picturesque charm.

FIREPROOF CURTAINS FOR THEATRES.

MR. JOHN STONES, of Ure Mills, Ulverston, whose iron revolving shutters are so well known to architects, has introduced a new fireproof curtain, which appears to possess all the necessary qualities for resisting the spread of fire in theatres and public buildings. The old iron curtain has not answered the expectations of theatre proprietors and architects. The curtains of Mr. Stones are made in a variety of ways to meet different requirements. The curtain can be made in one sheet, balanced above the opening by weights and chains, or the curtain can be made in two parts, one part to ascend and the other to descend, and so connected as to draw together automatically, and close the opening when liberated. The framework of the curtain is constructed of light L or T-iron, with diagonal stays to preserve the form. One side the frame is covered with thin corrugated steel sheets, lined with silicate cotton or mineral wool, which is pressed into the corrugations, and covered over with a network of steel; the two sheets of steel are connected by bolts. The curtain, in fact, combines the rigidity of iron plates in a corrugated form, with the fireproof qualities of silicate cotton. The asbestos cloth curtain has the serious defect of showing the glow of fire; but in Mr. Stones' curtain the outer sheet is protected by the backing or filling of the silicate cotton, and therefore no sign of a fire on the stage-side could be rendered visible—a very important point in preventing panic, in addition to which the sound-proof property of the cotton will deaden any noise or confusion that otherwise would be heard by the audience. Stones' new folding curtains for closing very wide openings in one continuous sheet is another useful invention for shutting off the proscenium in case of fire. The curtains are composed of a series of curvilinear iron plates hinged together, and made to fall upon one another in a zigzag form by means of lifting chains or wire ropes. We strongly recommend these curtains to the notice of theatrical managers and architects.

ENCAUSTIC TILE AND MOSAIC PAVEMENTS.

WE have received a new illustrated catalogue and price list from the firm of Josiah Wedgwood and Sons, Etruria, Stoke-on-Trent, whose great reputation as potters extends for more than a century back. Messrs. Wedgwood and Sons are now making, in addition to wall tiles, plain, encaustic, and porcelain floor tiles of very superior quality. These tiles are not the vitreous-faced kinds so often met with, but are vitrified throughout the substance. The chromo-litho illustrations represent in their true colours the several patterns that are manufactured to a scale of ¾in. to a foot, so that architects in their plans can select any design and introduce it in the space. The floor tiles in red, buff, light and dark drab, chocolate, and black are made in several patterns, the prices ranging from 5s. to 25s. per square yard. A large assortment of arrangements in the above colours, and also in blue and dark-green, celedon sea-green, buff, and pink are to be seen in the plates, some very simple and effective, suitable for vestibules, halls, and landings, others being of elaborate design, and in a nice harmony of colours. The patterns are based on the square and diagonal arrangements, the tiles being made in squares of several different sizes, in oblongs, triangles, hexagons, octagons, and half-hexagons and octagons. By the aid of the key diagram giving these shapes and the sizes, any designer can produce any arrangement. Very artistic and quiet in colour are the designs on plates 41 and 42, in which a drab ground with white star-like patterns are introduced. Plates 45 and 46 show some very rich patterns in which drabs, blues, greens, and reds are introduced. The last is suitable for a square lobby, the centre being two intersecting squares of rich colours upon a sea-green ground with bordering. The glazed dado and wall tiles comprise many tasteful combinations. We especially notice an ivory wall tiling with very delicate-patterned tiles in the dado, and two or three more of exceeding delicacy in shades, well adapted for laboratories. A large number of chaste patterns of printed tiles suitable for a variety of decoration will be found, also embossed and incised enamel glazed tiles suitable for dadoes, friezes, and furniture panels, representing decorative devices, classical figure subjects. We cordially recommend the new patterns and price-list to the notice of the profession.

BUILDERS' BENEVOLENT INSTITUTION.

THE fortieth anniversary dinner in aid of the funds of this Institution took place on the 3rd inst. at Carpenters' Hall, London-wall. Mr. Herbert H. Bartlett, president of the Institution, occupied the chair.

The chairman, in proposing "Success to the Builders' Benevolent Institution," said that this honourable charity had since its foundation granted relief to no less than 234 pensioners. During the past year, ten deaths had occurred, and nine persons who had been waiting had been elected, the total number on the fund being 32 men and 33 women. The annual expenditure was large, and the committee were anxious to obtain new subscribers, as many who had given regularly had been removed by death. The income of the past year had been insufficient to meet the expenditure, and the balance on the reserve fund had been withdrawn. The expenses of administration were as low as they could possibly be, and there was no expensive machinery. The building trade gave employment to more people than any other single trade in this country, but it was subject to untoward events, any one of which was sufficient to plunge a man from a respectable position into a condition of need. It was important, therefore, that those who were able should endeavour to mitigate such a sudden fall. Good as donations were, annual subscriptions were much more valuable, and he hoped that his hearers would each get at least two new subscribers, which would give the committee greater confidence in administering the funds of the Institution.

PAINTING ON CEMENT.

ACCORDING to the *Bulletin de la Céramique*, it is known that the caustic lime which is not in a state of combination in cement saponifies the oil used in painting. Consequently, painting on cement is only practicable when, under the influence of the air, carbonic acid has united with the caustic lime to form carbonate of lime. When it is desired to paint cement without delay, attempts are sometimes made to neutralise the lime by acids; but the above named journal recommends in preference the use of carbonate of ammonia, the acid of which combines with the lime while the acid is liberated. The effect produced is, however, only superficial. Various other expedients are referred to, but the solution of the problem would seem to consist in the use of caseine. Fresh white cheese and slaked fat lime are added to the colour. This mixture hardens rapidly, assumes the consistency of stone, and is insoluble in water, a formation of albuminate of lime taking place. It is according to this system that the mural paintings at the Berlin War Museum were executed.

To make the composition, three parts of cheese and one of slaked fat lime are stirred, the quantity of colour to be added being regulated by practice. Only earth colours or oxides of iron would be used for light red to dark brown shades; for blue, ultramarine or cobalt blue would be used; for white, oxide of zinc or sulphate of baryta; and for black, animal black. Inorganic colours, such as those of aniline, would not be used, nor would Prussian blue, vermilion, blue ochre, and white lead be employed, on account of the injurious effects of the sulphur present in the cheese in combination with these substances.

If the painting surface is too dry it can easily be damped. The caseous lime should be prepared daily, and the brushes should be cleaned after the application of each coat of paint. The process thus described is recommended for its economy, the walls of a house being painted as fast as the scaffolding is removed. The caseous paint does not easily take fire, and is therefore considered particularly suitable for the decoration of theatres, and for application to stage carpenter's work generally.

CHIPS.

The monument over the grave of the late Archdeacon Harrison, in Thannington churchyard, has just been completed by Mr. H. C. Sutton, of Canterbury, in accordance with designs prepared by Mr. Richmond, R.A., a friend of the deceased prebend. The cross is of Sicilian marble, mounted on a Calvary of three blocks of marble, which, in turn, stand upon a base of Aberdeen grey granite.

Mr. William Wilds, architect and surveyor, of Hertford, was accidentally burned to death on Monday. He celebrated his 86th birthday on Saturday.

Major General Hutchinson made an official inspection on behalf of the Board of Trade on Monday of the first section of the Oxted and Groombridge new line of the London, Brighton, and South Coast Railway, from Oxted to Edenbridge. The works have been carried out under the supervision of Mr. George Lopes, under the direction of Mr. Banister, resident engineer. The contractors, Messrs. Firbank, were represented by Mr. Stennett. This section of the new line will be opened for traffic on the 1st January.

At a general meeting of the Royal Institute of Painters in Water Colours, held on Monday evening, Mr. W. T. Blackmore was elected secretary.

Notices were posted at Lord Penrhyn's Carnarvonshire slate quarries on Monday announcing that full time would be immediately started. The quarries, which employ about three thousand hands, have for nearly a year been working only four days a week.

The report by the Board of Trade of their proceedings under the Tramways Act, 1870, and the Gas and Water Works Facilities Act, 1870, during the session of 1887, has just been issued. The tramway orders confirmed by Parliament were 12 against 13 in 1886, and the gas and water orders confirmed were 13 against 20.

A new memorial pulpit has just been placed in the church of St. John the Divine at Knotty Ash, near Liverpool. It has been designed by Messrs. Aldridge and Deacon, of Liverpool, and executed by Mr. Harry Hems, of Exeter. The base is composed of moulded and veined Devonshire marble. The body of the pulpit is of oak and of octagonal plan. It stands against the north wall, and on the five sides or cants facing the congregation are recessed and groined niches, occupied by statues of St. John the Baptist, St. Peter, St. Paul, St. Chrysostom, and Savonarola.

The Free Church at West Grangemouth, N.B., built in 1837, was reopened on Sunday after internal restoration, carried out by Messrs. J. and D. Meikle, of Ayr, joiners, and by Messrs. Bennett and Co., of Glasgow, decorators.

A new mansion is to be built at Stoke Park, Northamptonshire, from the designs of Mr. Richard Whitbread, M.S.A., Carlton, Nottingham, to replace the one designed by Inigo Jones, which was destroyed by fire about two years ago. The same architect is also designing the new Church and Convent of the Sacred Heart for the Little Company of Mary, to be built in Adrianna-row, Rome.

The foundation stone of a mission church was laid at Glencreban, near Oban, on Monday week. The architect is Mr. David Mackintosh, of Oban, and the contractors Messrs. MacColl and Graham, of the same town.

Dr. Edward Walford has been appointed medical officer of health for the Cardiff urban and port sanitary districts, at £400 per annum.

St. James's Church, Ashted, was reopened by the Bishop of Worcester on Sunday after restoration at a cost of £1,000. Messrs. Osborn and Reading, of Birmingham, were the architects, and Messrs. Jeffrey and Sons the builders.

The Bishop of Gloucester and Bristol recently consecrated the new chancel, vestry, and organ chamber which have been added to Redbrook Church within the past few months. Over the vestry is a little spire built of Bath freestone. The work was intrusted to Mr. A. Heath, of Coleford, the architect being Mr. J. P. Seddon, of London.

The new church of St. James, Gunnersbury, built from the designs of Messrs. Chatfeild Clarke and Son, was consecrated on Tuesday.

WAYSIDE NOTES.

WITH the opening meeting of the R.I.B.A. we enter upon a period of the year of greater interest to the architect, as, after Tuesday next, we shall have all the London architectural societies in full swing, with their attendant meetings, paper-readings, and discussions. The presidential address at the Institute last Monday did not foreshadow any great future undertakings on the part of the big Conduit-street body. Mr. I'Anson, however, evidently alluded with satisfaction to the time when Associates would be compelled to pass an examination if they are desirous of arriving at the full dignity of Fellows.

It would appear to me that this new measure of the Supplemental Charter, which is to come into force in the year 1892, is certainly wholesome and just. It will give the Fellow a better standing, in the same way that the Associateship is now of greater value by reason of the existence of the present obligatory examination, and will thus tend to raise the status of the body generally. It is to be hoped that the new examination will be pretty extensive. But it should be *chiefly* practical, and deal almost exclusively with that knowledge which is to be gained by experience in everyday business occupations, as few men have the time or opportunity for systematic book studies when they are engaged in the uphill work of making a business. And very many do struggle for years after they have become Associates in an endeavour to get a living by independent practice in the profession.

Mr. I'Anson commended to the attention of those present at Conduit-street the other evening the project of federation and the scheme of registration. It is cheering to hear the President of the R.I.B.A. speak of the latter subject as "important." Let us hope that those thus advised will really give some consideration to the matter.

Until the registration scheme is complete, we must acknowledge that there is some excuse for the public pleading a want of confidence in the architect. But, touching "the future of the architect," is there not an old aphorism which says that "every man is the architect of his own fortune"? This must certainly be the case with regard to the architect. He has, doubtless, at times a great struggle in his younger days; but there are few businesses more likely to repay well-directed energy and that abundant self-denial which all who are in earnest will carefully study. Despondency, at any rate, will help none, and is generally taken as a confession of individual weakness.

I do not think that the architect has cause to fear the builder (this for the encouragement of the halting and faint-hearted, though the very idea makes one smile) — that is to say, the *true* builder, who is confessedly the subordinate of the architect, and who, when he has confidence in the architect, there is none who reverence him so much and look up to him on all occasions. It is pleasant, I would remark in passing, to hear a genuine, good-hearted builder speak with pride of the architect he is working under. It does one good to hear such persons spoken of with evident enthusiasm.

"He is such a gentleman," and "It is a pleasure to do anything for him." "Everyone is glad to oblige Mr. ——." On the other hand, no one has a greater contempt for the charlatan and the bully as our honest, horny-handed builder. Many will call to mind how he delights in showing up the fraud, or in dwelling upon the shortcomings of the overbearing tyrant.

But it is quite another thing in respect to Mr. Buggins. He, indeed, is the enemy of the architect, though even he is only as the advance guard of the leasehold system that wars so successfully against our interests. But we need not fear that the speculating builder will supersede the architect!

By the bye, the rumour that the good people of Truro are likely to employ a jobbing builder to complete the design and works at their new cathedral in the place of Mr. Pearson is totally without foundation, so that no undue alarm need be felt by those who despair as to the future of the architect (!).

There will be a new field for the operation of the speculating builder soon. Last Monday an official inspection was made of the first section of the Oxted and Groombridge new line of the London, Brighton, and South Coast Railway from Oxted to Edenbridge. I believe that this section of the line will be ready for traffic at the beginning of the New Year. New estates will doubtless be opened in the district it traverses, and "desirable villas" spring up like mushrooms.

Last Saturday there commenced to run special express trains to and special steamers from Dover, in connection with the "Train de Luxe" to the Riviera, thus affording those persons who may have been charmed by the exhibition in Bond-street —the "Sunny South" —a chance of visiting, in comfort, this fair corner of the earth. I spent a very enjoyable hour or so in examining Mr. Talbot's drawings. There is not much architecture about them, but what there is is singularly interesting. The sketches in Algiers, for instance, give us little peeps of the architecture of that far-off town that it does not fall to the lot of all to visit. From all the pictures of Algiers that one sees it seems charmingly curious —a bright, sunny place with white houses and quaint scenes of Arab life and strange architecture in its streets. One may quite reasonably expect to someday see Algiers a fashionable health resort, if only better and more regular communication could be effected with it.

The Riviera sketches are very pretty indeed, and give those of us who have never been there an idea of the nature of this portion of the Sunny South, with the deep blue sea and sky, and great mountains that run right down to the water's edge. Some of the old towns, too, are represented. I understand that there is a rich hunting-ground amongst these old half-deserted villages of the mountains above the Riviera that is to say, for the architect who is fond of novelty rather than intrinsic beauty in buildings. Recently, I was examining some fine photographs of the Riviera and neighbourhood, and among them one of the little, almost deserted village of Ege. It seemed a fascinatingly interesting place, weird in its situation at the summit of a mountain covered with olive-trees; and far below, the great mountain-spurs jutting boldly out into the Mediterranean.

In a room adjoining Mr. Talbot's sketches is a collection of drawings by Mr. Ernest George that should receive a visit from the architect. Many of the most picturesque corners of Europe (as regards architecture) are there represented. Charming sketches of the old brick gables and turrets of Bruges and the Low Countries generally; beautiful studies in Normandy, in Northern Italy, and in Rome are there to be seen. Our own dear old English architecture is not forgotten, and many a quaint piece of brickwork has been represented in freely-flowing water-colour. I quite admit that a great mistake has been made in hanging the pictures so monotonously; but ample compensation will be found in the fact that each and every one has the name and whereabouts of the subject clearly inscribed upon it. This is really an inestimable boon to those examining a collection of drawings, as nothing is so annoying as to have to keep constantly bobbing one's head from picture to catalogue, and from catalogue to picture, in one's efforts to determine to what quarter of the globe a given subject belongs.

GOTH.

New board schools recently erected in Albany-road, Cardiff, were formally opened on Wednesday week. The work has been carried out, under the supervision of Mr. A. Llewellyn Batchelor, by Messrs. Stephens and Bastow, of Bristol. The buildings afford accommodation, in the aggregate, for 1,235. Excluding the cost of the site (£3,168), the schools have entailed an outlay of £9,000. In addition to the usual classrooms, there is a marching school, 30ft. by 20ft.

Mr. C. Meaby, the newly-appointed surveyor of St. Luke's, E.C., has just been presented with a silver tea and coffee service by the inhabitants of Chelsea, as recognition of his services as assistant-surveyor of that parish.

ARCHÆOLOGICAL.

THE RUTHWELL CROSS.—The parish church of Ruthwell, Dumfries-shire, was reopened on Monday after enlargement for the reception of the widely-known Runic cross. The cross, which is of freestone, is supposed to date from about the close of the 7th century. Its broad faces are enriched with sculptured representations of Scripture subjects, accompanying each of which is an appropriate quotation in Latin; but the Runic characters carved on the narrow sides give to the stone its unique value. These form a border surrounding a running scroll of vine, with birds and beasts lodged in the branches. Mr. J. M. Kemble found, about half a century since, that the language was Anglo-Saxon, of the type current in Northumberland in the 7th and 8th centuries, and produced a copy of the inscription in verse. This was afterwards ascertained to be a portion of Cædmon's "Dream of the Holy Rood," of which a perfect manuscript copy was discovered in the convent at Vercelli. The name of Cædmon himself appears on the top stone of the monument. At the Reformation the stone was broken, and the pieces lay neglected in the interior of the church until the late Rev. Dr. Henry Duncan had it restored and erected within the manse grounds in 1823. The restoration included the supplying of new transverse arms, the original pieces having been lost. The embellishment of the cross, which conveys a very favourable impression of early Christian art, was suffering visibly from exposure to the weather, hence the Rev. J. Macfarlan, the present incumbent, decided to have it placed under cover. A grant of £40 has been made from the national funds towards the cost incurred in the protection of the cross. This amounted to £300, the balance being defrayed by subscription. The plan adopted was to build a recessed chamber on the south-west side of the church. This chamber is not screened off and accommodates the minister's reading desk and the precentor's seat, as well as the cross, which is placed at the back. The full height of the monument, 17ft. 8in., is now exposed. A wooden railing encloses the cross, and to it is attached a brass plate bearing the inscription:—"The Ruthwell Cross dates from the Anglo-Saxon times. Destroyed during the conflicts which followed the Reformation; lay on the earthen floor of this church from 1642 to 1790; erected in the manse garden in 1823; sheltered here and declared a mouument under the Ancient Monuments Act in 1887."

CHIPS.

A bust of the Queen has just been fixed in the town hall, Macclesfield. The bust is of white marble and is mounted on a pedestal of *brèche sanguine* African marble. An alcove has been prepared for its reception on the main staircase of the town hall. The sculptor is Mr. R. L. Boulton, of Cheltenham, who also executed the two life-size statues in niches on either side of the bust.

Mr. S. J. Smith, C.E., held an inquiry on Monday into an application by the Bangor City Council to the Local Government Board for sanction to borrow £1,600 for the extension of the water intake; £500 for the purchase of the lease of the Siliwen Baths; and £160 for private improvements. Evidence was tendered by Mr. Gill, the city engineer.

It is expected that next spring the Queen will unveil the colossal bronze statue of General Gordon, which is to be erected at Aberdeen in front of the Art Gallery. This statue was subscribed for by members of the Gordon clan, and it has been executed by Mr. Burnett, A.R.S.A., of Edinburgh.

At Farm-street Church on Sunday week the Chapel of Our Lady of Lourdes was solemnly opened. The altar is of alabaster and serpentine marble, and the reredos of Caen stone with Devonshire marble columns, and contains a statue of Our Lady, executed at Leghorn, in white marble. The architect is Mr. Purdie, of Brook Green, and most of the carving has been executed by Mr. Anstey.

New premises have just been erected for the Liverpool Exchange Club, from plans by Messrs. Grayson and Ould, of that city. The formal opening took place on Friday.

A monument of Cluny stone has been erected over the grave of the late Robert Bryson, of Edinburgh, in Warriston Cemetery. It is of Greek design, with moulded base and pediment, and a medallion portrait in the centre. The medallion was executed by Mr. Stuart Burnett, A.R.S.A., who also designed the monument.

NEWCASTLE CATHEDRAL.

UPON the formation of the Diocese of Newcastle, it was settled that the great parish church of St. Nicholas, which has an area of over 20,000sq.ft., should become the cathedral. The fabric was thoroughly repaired some time ago under the direction of the late Sir Gilbert Scott; but the choir was left with very temporary fittings. In the new conditions it became necessary to complete the work in a manner suited to the circumstances of the case, and hence the works shown in the illustration. Mr. Robert J. Johnson, F.S.A., of Newcastle, was appointed as architect, and, aided by a very handsome donation for the special object, the reredos, with the sedilia and side screens, which for the moment form the principal feature in the work, were very soon taken in hand. This work, with the completion of the bishop's throne, the choir paving, and other matters, is to be dedicated on the 13th inst. The choir stalls, with their screens and canopies, and the remainder of the works, are in progress, and it is expected that everything will be completed by the end of 1888; the reredos is about 20ft. high from the foot pace of the altar, and with its splayed wings extends all across the choir. It is made of very fine Uttoxeter alabaster, and, as will be seen, its general idea is taken from Winchester and St. Albans. Immediately above the altar a range of nine niches holds as many figures of angels, bearing shields with the emblems of the Passion. Above is a seated figure of Our Lord, crowned and enthroned, the right hand raised in benediction and the left bearing an orb. The four niches immediately adjoining have the four Evangelists, each with his attendant emblem, and the two outer niches on this range hold figures of St. Mary and St. Gabriel, indicating the doctrine of the Incarnation. The upper row of figures comprise St. Cuthbert in the centre, with the head of St. Oswald, St. Nicholas, St. Oswald, Ven. Bede, St. Aidan, St. Benedict Biscop, and St. Edwin, all, excepting St. Nicholas, being Northumbrian Saints. Below, on either side of the altar, are St. Wilfrid and St. Paulinus, and the ten small niches on each side of the central figures have small statuettes of Virtues. All these figures have been very beautifully modelled and carved in the purest white English alabaster by Mr. J. Sherwood Westmacott, of Pimlico. The sedilia and side screens of the sanctuary are worked in Caen stone in a very rich manner. There are many special gifts, including an altar of oak and cedar with a marble slab in the top, that has been used for an unknown period in the church for a similar purpose. There are also frontals for the seasons, the white one being specially handsome, and representing the Tree of Life, with angels on the orphreys playing on instruments of music. The silver gilt cross, the candlesticks, and the flower vases are also gifts, and all the individual gifts have been specially designed by the architect. The bishop's throne (the lower part of it made for the enthronement of the bishop in 1882), has now been raised on several steps of marble, and completed by the addition of stages of canopy work and a crocketed spire, according to the original design. The space between the back of the reredos and the east end of the church has been adapted as a chapel. The floor has been sunk to the original level of this part of the church, and oak screens have been put up in the aisles to mark off the limits of the chapel. The second altar is placed immediately under the east window, on a marble pavement. It has a reredos and panelling of oak, the reredos being a triptych richly painted and gilded. This is to have paintings of the Nativity, the Annunciation, and the Visitation, with figures of the prophets on the doors. These pictures will, it is hoped, be ready by Christmas. All the alabaster and marble work, except the figures, has been done very well by Mr. R. Beall, of Newcastle, and his brother, and the oak work by Mr. R. Hedley, of Newcastle, under the personal direction of the architect.

A VIEW IN NEWCASTLE-ON-TYNE.

ANTICIPATING the opening ceremony in the Cathedral at Newcastle next Sunday, we have reproduced to-day a line drawing by the celebrated architectural draughtsman, T. M. Richardson, sen., showing the unique tower of St. Nicholas, as represented in his fine picture, which now belongs to Mr. John Waller. Richardson has done more for the old city of Newcastle than even its historians. Everything in it that was quaint, or interesting, or beautiful he has in some way recorded, either with his pencil, his etching needle, or his brush. The view which we have photo-lithographed is from one of his best studies, full of incident, bright with sunlight, and crowded with figures, yet skilfully subordinated to its real subject —the adequate illustration of the great church spire and belfry. Of the artist himself it may be said briefly that he was born in 1784 at Newcastle-on-Tyne, and in due course was apprenticed to a cabinet-maker, by whom report says he was very badly treated. On the death of his father in 1804, he filled the post of master of St. Andrew's school at a salary of £30 a year. At this time he obtained a little leisure for persuing his artistic studies. Sickness obliged him soon to take a voyage to London for change of air, and during his stay he is said to have accidentally seen some of David Cox's works, which so influenced his aims and opened out his powers of appreciation for the beautiful that he resolved to resign his post as schoolmaster and devote his whole energies to painting. He was, however, neither encouraged nor appreciated by his contemporaries or fellow-townsmen. In 1816 he commenced a series of aqua-tints in illustration of Newcastle and the neighbourhood; following these publications with a set of mezzotint engravings of castles of the English and Scottish Borders. Subscribers were scarce, however, and the cost of publishing was great, so that both enterprises were financially unquestionable failures. Richardson, notwithstanding, was bent on improving art knowledge and in furthering its interest, so that we find him in 1822 working hand in hand with Thomas and Robert Bewick to inaugurate the first Fine Art Exhibition in the North of England. He contributed fourteen pictures on this occasion, and for many years was the chief promoter of several similar exhibitions held in the town. "The Old Fish Market, Newcastle," was exhibited by Richardson at the Royal Academy in 1814 as his first appearance in the great Metropolitan show. His most important works are "Newcastle from Gateshead Fell," "View of the Side, with the Annual Procession of the High Sheriff of Northumberland to meet the Judges," "Scene on the Thames at Greenwich," and "Stirling Castle." A contemporary writer says of the first two named here that "they might hang side with any similar subjects by Turner, or any other painter of the English school, without losing by comparison." The first mentioned picture is said to have been Richardson's finest oil painting, though the Corporation of Newcastle only gave £50 for it when they completed its purchase for the town in 1833. The artist died in 1847 at the age of 63, after a life of patient industry devoted to his art, and distinguished by perseverance against almost insurmountable difficulties. His son, Mr. T. M. Richardson, is well-known in London as a water-colour artist. We are indebted to Mr. Andrew Reid, of Newcastle, for the loan of the original, from which our plate is taken, and it may be of interest to remark that this gentleman has recently published a chromo-lithograph of the same picture, which measures 3ft. by 4ft., to the reduced size of 28in. by 40in. (double elephant), and he proposes to give others of our English cathedrals by other painters, the next of the series being a view of "Durham Cathedral," from a picture by Mr. Robert Jopling.

THE BRIDGE LODGE, NETHERCOURT.

THE illustration shows one of the lodges to Nethercourt (which we illustrated some time back). As the road here crosses the Dollis brook, a feature has been obtained by uniting the lodge and bridge. The materials are the same as the house—*i.e.*, red brick, Stoke Ground dressings, and tiled roof. The architect is Mr. Percy G. Stone.

SPANDREL FIGURES, HISTORICAL ART MUSEUM, VIENNA.

THE subjects of these sculptured figures by Professor Rud Weyer are selected from Old Testament and pagan history. In the upper row in the centre is the head of Hiram, the Phœnician architect of Solomon's Temple; on the left David, and on the right Isaiah. In the centre is the head of Tubal Cain, with a sibyl on either hand, Persica being on the left and Delphica on the right—both priestesses of the Oracle at Delphi. In the lowest row we have St. Luke in the centre, with Ezekiel on the left and Cumæa, the sibyl, on the right. We are indebted to the Editor of *Bauindustrie-Zeitung* for the photographic plate from which our illustration is taken.

NOTTINGHAM BOROUGH LUNATIC ASYLUM.

WITH our illustrations we publish a perspective view of the Nottingham Borough Lunatic Asylum. The original building was commenced in 1876 from designs prepared by Mr. George T. Hine, F.R.I.B.A. (selected in open competition), providing accommodation for 280 patients; but owing to the rapid growth of the town and extension of the borough boundaries, the asylum, even before its completion, was found to be insufficient for the patients then in the borough. The building is now being enlarged by the erection of an annexe for 250 patients, which will be entirely devoted to males, and the original building will be adapted for female patients only. The new wing is divided into wards to accommodate separately five classes of patients. On the ground floor are day and night wards for epileptics and infirmary patients, also a reception ward for recent cases. On the first floor is a ward for acute cases, and four day wards for chronic patients, the second floor being devoted entirely to dormitories. A large recreation hall, with chapel over, forms part of the new building, which will be used for entertainments and services by both sexes; the hall being also a dining room for the male patients. The old recreation hall will in future be used exclusively by women as a dining hall, and the old chapel will be converted into additional ward space for females. When the asylum is completed, it will provide accommodation for about 320 females and 250 males, and 10 patients in the isolation hospital. A kitchen is included in the new wing for the service of the male asylum, and in the entrance block are rooms for the assistant medical officer; all other store rooms and offices being provided for in the general administrative department of the old asylum. The new and old buildings communicate by a corridor, which passes underneath a portion of the buildings as a subway, lined internally with glazed white bricks, the ground floor of the new building being 10ft. lower than that of the old. This was found the most direct mode of connecting the two buildings. The building generally is constructed of red brickwork, the cornices, window and door dressings, &c., being executed in moulded bricks. The internal walls of all corridors, also all staircases used by patients, will be lined to a

height of 4½ft. with glazed bricks in bands of different colours, and the entire faces of walls of bath-rooms, lavatories, water-closets, slops, &c., will be lined with white glazed bricks. All the day wards, also the dormitories for sick and infirm patients, will have wooden dadoes about 4ft. high, the walls above being plastered. The joiner's work generally will be executed in pitch-pine, stained and varnished. The new building is to be heated by warm air propelled into the different rooms by Blackman's fans, and heated by passing over coils of steam pipes in the basement below the entrance to each ward. The air is conveyed under the ground floor by brick tanks, and thence to the different rooms by vertical flues in the walls. Another system of extraction flues is provided to draw the vitiated air from the various rooms, these flues communicating in the basement story with the base of the three high towers, in the centre of which is a large vertical external shaft. The present works are being carried out under the direction of the architect of the original building, who has had the advice and assistance of Mr. E. Powell, the medical superintendent, in arranging the building most conveniently to meet modern requirements for this class of patients. Messrs. Bell and Son, of Nottingham, are the contractors; and Mr. Harper, the clerk of works for the original structure, is still at his post to supervise the completion of the new wing.

CHIPS.

The foundation-stone of St. Dunstan's College for Boys, now in course of erection on the north side of Stanstead-road, Catford, was laid on Friday. Mr. E. N. Clifton, of East India-avenue, E.C., is the architect, and Messrs. Brass and Son, of Old-street, St. Luke's, are the builders.

The Leeds town council have raised the salaries of Mr. Geo. Tooley, manager of the Meadow-lane Gas Works, and of Mr. Edward Jno. Lloyd, manager of York-street Gas Works, from £200 to £250 per annum; and that of Mr. Wm. Suddaby, superintendent of gas mains and services, from £115 to £150.

A stained-glass window, representing Our Lord's Baptism, has just been placed in Bagnall Church, Staffs. It has been executed by Mr. John Davies, Wyle-cop, Shrewsbury.

A full-length portrait of the late Earl of Iddesleigh, painted by Mr. Sydney Hodges, has just been placed in the Junior Carlton Club.

Mr. George Eli Mellor, builder, of Stockton-on-Tees, died suddenly on Friday. He had been a member of the town council for some time, till Tuesday, November 1st, when he failed to secure re-election.

The memorial stones of new Baptist mission and school buildings in Lamb-street, St. Augustine's, Bristol, were laid on Friday. The building will be three stories in height, the ground floor being arranged as an infants' school, the first floor as class rooms, and over this a hall, 55ft. by 26ft., and committee room. Messrs. Foster and La Trobe, of Bristol, are the architects, and Mr. Edward Walters, of Montpelier, Bristol, is the contractor. The cost of buildings and site will be £2,600.

An altar desk has been presented to Salisbury Cathedral as a memorial of the late Bishop, Dr. Moberley. It is of polished brass, executed by Messrs. Singer and Son, of Frome. The plate has four perforated ornamental quatrefoils, and is supported on each side by brass scroll work.

On Thursday afternoon, the 3rd inst., memorial stones of a theatre which is now in course of erection in Alexandra-street, off Witt-road, Widnes, were laid. Messrs. Sayce and Randle are the contractors.

A reredos of carved oak, the work of Messrs. Frank Smith and Co., of Southampton-street, W.C., has just been placed in Kenchester Church, Herefordshire.

We omitted to state last week that Truro Cathedral is warmed by Mr. John Grundy's patent combined system of pure warm air and hot water. At the opening services last week an equable temperature of 57° Fahr. was maintained throughout the entire building.

Mr. Henry Cunnington, a well-known West of England archæologist, died at his residence in Devizes last week. Mr. Cunnington, who was a grandson of the late William Cunnington, F.S.A., of Heytesbury, the poineer of archæology in Wiltshire, was an earnest worker for the promotion of archæological science, and was especially known through his efforts to insure the preservation of Stonehenge.

ST. JOHN'S CHURCH AND VICARAGE, STAMFORD-HILL, N.

THIS church, completed last year, is built of red bricks. Red terracotta and Mansfield stone are used for large west and for east windows, the only Bath stone introduced being for columns of nave, baptistery, and chancel arch.

The dimensions are as follows:—Nave, 85ft. by 27ft. 4in.; height to top of wall plate, 32ft.; chancel, 32ft. by 24ft., and the vestries are divided by a folding partition, making a room 28ft. 9in. by 13ft., for confirmation and other classes; there is also a semicircular baptistery under west window, and an organ-chamber, 17ft. by 14ft. The tower has been omitted for the preseut. The total cost of the work has been £5,450 (exclusive of architect's commission), the accommodation being for 650 persons. This includes font and pulpit in Caen stone by Mr. Gilbert Seale, of Walworth. Mr. John Grundy carried out the heating, and the whole of the works were executed by Mr. James Holloway, of Lavender-hill, Wandsworth.

The architect's instructions as to the vicarage were that the cost should not exceed £1,500 for everything. This involved a plain residence, including, however, all the accommodation required by the Ecclesiastical Commissioners, and by a judicious arrangement of plan, the position of rooms being rendered necessary by the site, a somewhat picturesque house is obtained, which groups well with the church so closely adjoining it. The principal dimensions are as follows:—Drawing-room, 21ft. by 15ft.; dining-room, without large bay, 15ft. by 13ft. 6in.; kitchen, 13ft. 6in. by 13ft.; study, 12ft. 6in. by 11ft; the materials used being similar to church: red brick, brown tiles for roof, red for tile hanging, with a few of Brown's ornamental and moulded bricks.

The lowest tender, which includes everything but front boundary fence, was that of Messrs. Paine Brothers, of Stamford-hill, for £1,385, and they are now carrying out the works, under the direction of the architect, Mr. Spencer W. Grant, A.R.I.B.A., of 63, Finsbury-pavement, E.C.

PROPOSED HOUSE AT MOTTINGHAM.

THE illustration of the above house given to-day is from the designs of Mr. Leonard V. Hunt, and is proposed to be erected at Mottingham, near Chislehurst, Kent, for Mr. Walter Garratt. The walls are of red brick, partially tile-hung, and the main gable is of half-timber work. The plan is self-explanatory.

The trade year in the Staffordshire Potteries, which closed last week, has been remarkable for the great increase of business done with the United States, notwithstanding the growing competition of American potters, and the extremely low selling prices which have prevailed in the district in every department. The shipments of Staffordshire ware from Liverpool for America are little short of the exports to that country in 1883, which were then higher than in any previous year since 1872. The turnover in the home trade is diminishing, and there is a constant request for a cheaper class of goods from all parts of the United Kingdom.

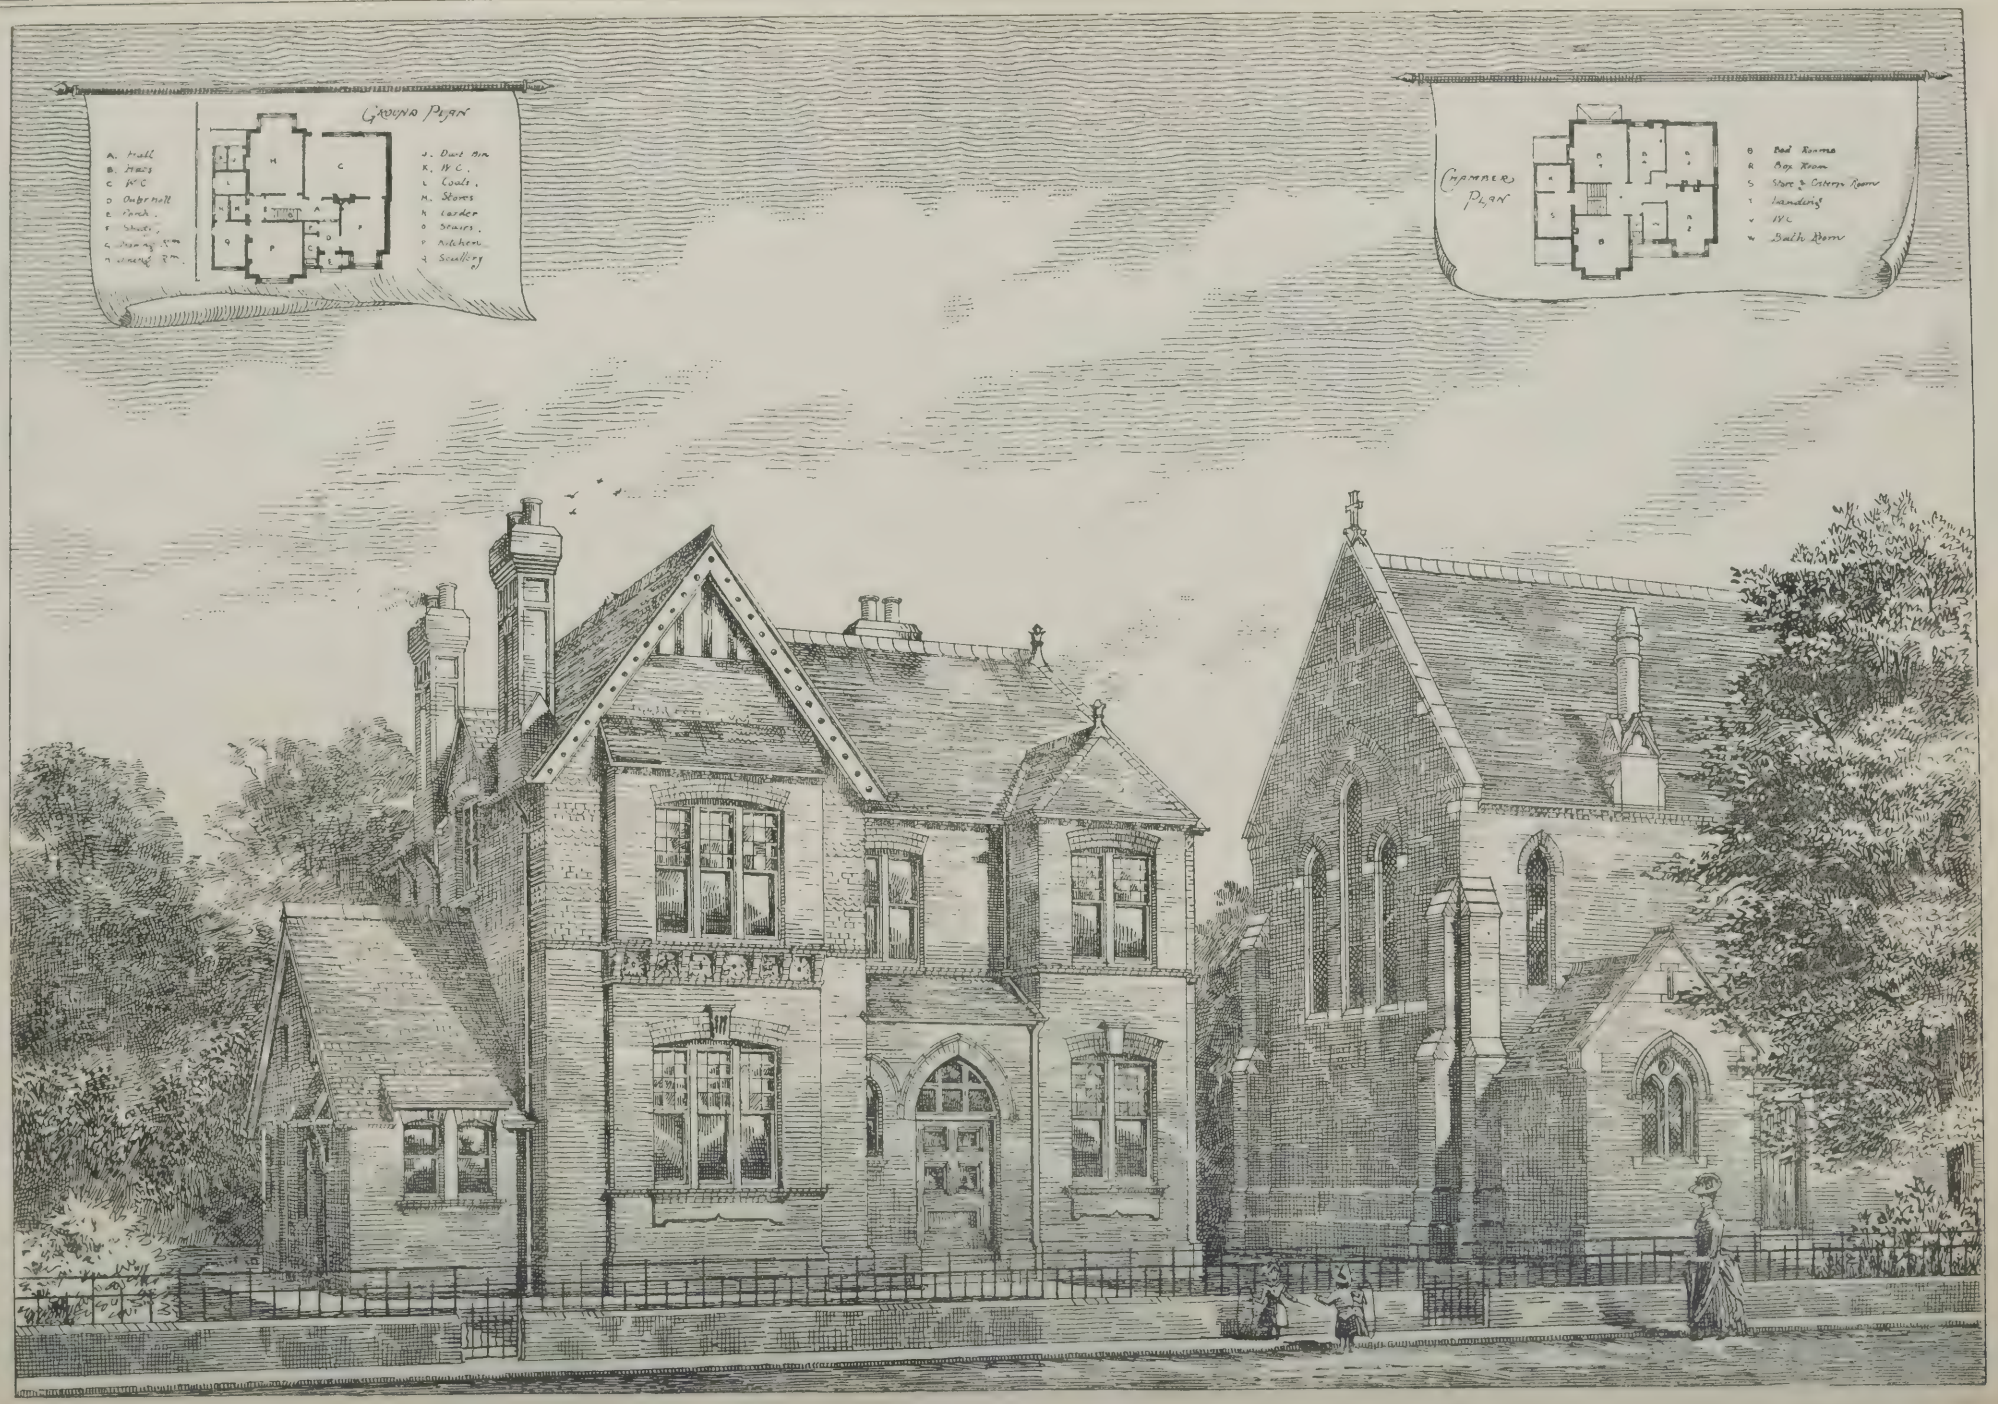
The President of the Institution of Civil Engineers, Mr. G. D. Bruce, delivered, on Tuesday evening, the inaugural address of the session, in which he sketched the advances made by engineering science during the Queen's reign. In that institution, on the day of Her Majesty's accession, he said, there were 238 members of all classes; on the 20th June, 1887, there were 5,396 members, the total income at the respective dates being £713 and £21,015 a year. Beyond this the institution stood as the mother of many kindred societies dealing with sections of those great questions which fall within the all-embracing profession of a civil engineer.

In our notice last week, p. 709, of the opening of the Catholic Church in Norton-road, Hove, Brighton, it should have been stated the whole of the carvings, including the high altar and the altar to St. Joseph, the new font, the communion rails in stone and marble, with marble steps to the sanctuary, and two side chapels, fourteen new large corbels, angels to nave, a statue of the Sacred Heart over entrance, holy water stoups in marble and stone, and other works to the church, were executed from designs and instructions of the architect, Mr. Joseph S. Hansom, F.R.I.B.A., London, by Messrs. R. Boulton and Sons, of Cheltenham.

Weston parish church, Cheshire, was reopened on Thursday, the 3rd inst., after restoration, carried out by Mr. A. P. Cotterill, builder, of Crewe.

Engineering Notes.

NEW LANARKSHIRE AND AYRSHIRE RAILWAY.—This new railway system, which will connect the Lanarkshire coalfields with the lower reaches of the Clyde, is making good progress. It is at present in course of construction between Barrmill and Ardrossan. The contract involves the construction of about 60 bridges with culverts, retaining walls, platform walls, &c., giving about 90,000 cubic yards of masonry, 1,400,000 cubic yards of excavation, and 90,000 cubic yards of ballasting. The length of the new railway is about 20 miles. The contractor, Mr. M'Alpine, Glasgow, has employed 12 locomotives, two steam navvies, 50 cranes and stone crushers, and 300 waggons, with 2,000 tons of service rails. The bridges on the Kilbirnie branch are all of concrete. At one part of this branch there are 6,000 cubic yards of concrete with an area of 200 yards. The abutments and wings are all built *in situ*; the parapets, belts, and copes are all made in blocks and afterwards set in Portland cement. The facing work is done with Arran sand, which leaves a uniform surface after removing the boarding. A two span bridge thrown over the railway of the Glengarnock Steel Works is built in arches concrete blocks serving the purpose of ashlar The girders of the bridges each rest on a block of Ben Cruachan granite. On the main line, the permanent way to Ardeer, nine miles distant, is laid. The heaviest piece of work on the line is the viaduct over the Garnock, near Kilwinning. It comprises seven semi-circular arches of 50ft. span, and is built of stone taken from Mr. M'Alpine's quarry at Auchenmeade. The height from the water to the rail level is 80ft., and the cost of the structure was £10,000. Near by this station the largest bridge on the line is reached. The span is about 113ft.; length of girders, 126ft.; and weight of steel work employed, 400 tons. There are 1,800 yards of concrete masonry. The branch line to Nobel's Explosives Works has just been finished. There are 29 bridges between the Garnock viaduct and Ardrossan. The South Beach cutting is two miles in length, representing the excavation of about 300,000 cubic yards. In this undertaking Mr. M'Alpine until lately had in his employ 1,200 men. The new line will be opened to Ardrossan in May next.



COMPETITIONS.

BLACKPOOL.—In a limited competition for Methodist New Connexion chapel at Blackpool, the plans of Messrs. William Hill and Son, architects, 69, Commercial-road, Landport, have been selected.

PRIZES FOR LINOLEUM AND FLOOR CLOTH DESIGNS.—The Mitcham Linoleum and Floor Cloth Company, Limited, offer to designers prizes to the amount of £200 for designs suitable to linoleum or floor cloth. A series of five prizes will be given for the five best sets of three designs—viz., £75, £40, £20, £15, and £10. Additional prizes are also offered of £20 for the best design of three colours, and £20 for the best design of four colours. The two last prizes will not be awarded for any design included in the 1st, 2nd, 3rd, 4th, and 5th prizes. The directors of the company, assisted by Mr. G. H. Birch, F.S.A., will make the awards, and their award will be final.

Mr. Benjamin Baker, M.Inst.C.E., joint engineer with Sir John Fowler, of the Forth Bridge, delivered, on Friday, the first of the Armistead course of lectures to a large audience in the Kinnaird Hall, Dundee. He gave a graphic account of the construction of the Forth Bridge, illustrated with limelight views. In the course of his lecture Mr. Baker stated that the annual loss of life averaged 1 in 300 of the workmen employed at the bridge, while amongst the guards and brakesmen of goods trains the average was 1 in 192.

The Edinburgh Public Library Building Committee have received a report by the Dean of Guild from Mr. Washington Browne, architect, on the estimates for the erection of the public library buildings. The lowest tenders for the various classes of work have been accepted, and the building will be completed for £20,000, or thereabouts, instead of, as was anticipated, £24,000 or £25,000. This does not include such items as the electric lighting, furnishings, &c.

Building Intelligence.

BIRMINGHAM.—An important block of property, situate at the junction of Albert-street and Moor-street, Birmingham, is about to be commenced. This building will have a frontage of 120ft., and will be four stories in height. The basement portion will be let off for wholesale wine and spirit vaults, the ground floor for wholesale shops, and the upper floors for wholesale warehouses. A large yard at the rear, covered with glass, will be adapted for an auctioneer's store-room. The front elevation will be Early Gothic in style, and terracotta dressings, &c., will be freely used in the erection. This building is to be erected for Mr. John Swann, from plans, &c., prepared by Mr. John Statham Davis, architect, both of Birmingham.

BOTHAL.—Bothal Church, Northumberland, is being restored from plans made by Mr. C. Hodgson Fowler, F.S.A., of Durham. This is one of the most interesting churches in Northumberland. The church dates from the early part of the 13th century; but all that remains of that date is the north arcade and the chancel. In the latter part of the 14th century a south aisle had been added and clerestories built, and the whole church re-roofed. These 14th-century roofs have been taken off bay by bay, repaired, and put back, the whole church remaining as it was rebuilt at the above date. Every window in the north and south aisles contains some beautiful painted glass of the above date. This has been carefully releaded on the work, and put back in the same position where found. The church also contains a very fine alabaster monument, with two recumbent figures of the Ogle family, dating from the early part of the 16th century. During the restoration, a quantity of old stones have been found, leaving no doubt that both an Early Norman and Transitional church stood on the same site. The remains of a quantity of Saxon crosses have been found—some very fine samples of work at that date. The work is expected to be completed early next spring. Messrs. R. Carse and Son, of Amble, are sole contractors, and Mr. T. Carse clerk of works. The restoration is costing about £2,000.

DODBROOKE, DEVON. — The parish church having undergone a much-needed restoration, was reopened on Sunday. The church is in the Perpendicular style, and consisted previous to the restoration of a chancel and nave, with south aisle and a square tower, at one time surmounted by a spire. The last restoration took place in 1846. The restoration has included the erection of a new north aisle, this addition providing about 90 sittings. The architect was Mr. J. D. Sedding, of London, and the contractors were Messrs. S. Farr and Sons, of West Alvington. The chancel has been entirely rebuilt, the flooring being of Upton wood and slate set in diamond pattern, the steps leading to the altar formed of slabs of the same stone. The Communion table and its rails are of oak. The choir seats are of wainscot oak with linen-panelled fronts. The north aisle is divided from the chancel and nave by an arcade of three new Dartmoor granite arches, and three old ones taken from the ruins of the now disused church of South Huish, replaced by a new one about 15 years ago. The screen of Dodbrooke is well known to students, and is by many considered the finest in Devon. The west window of the north aisle was formerly the east window in South Pool Church, and is now filled with stained glass. In the south aisle the removal of the ceiling has exposed an oak roof with carving and bosses. The west end gallery has been taken away. The new seats are of pitch-pine, with linen-panelled backs and fronts. The work has been carried out at a cost of about £2,000.

GUISBOROUGH.—The foundation-stone of a new Grammar School was laid at Guisborough on Friday, last week. The buildings are being erected from plans by Mr. Alfred Waterhouse, R.A.; and will consist of school premises, with accommodation for boarders, and head master's house. Some old scappled ashlar, obtained by pulling down the almshouses, has been re-used for external walls up to the window heads of the ground floor, relieved with buff terracotta plinth, stringcourses, and mullioned windows. Above the ground floor red pressed bricks, in Flemish bond, pointed with black ash mortar, are used, and relieved with terracotta dressings. There will be a bell turret on the roof, and the roofs will be slated. A carriage archway will be pierced in the centre of the building; and on the west side is the schoolroom, 41ft. 3in. long by 23ft. 3in. wide; this has a fireplace at each end, the floors consisting of wood blocks laid diagonally in tar, and the walls of glazed bricks from floor to ceiling, ivory white and grey in colour, interspersed. On the east side of the archway is the boarders' dining-room, 23ft. 3in. by 18ft. On the first floor are class-room, master's room, and dormitory. Mr. A. White, of Guisborough, is the contractor, and Mr. John Cook clerk of the works. Messrs. Wilcocks, of Burmantofts, are supplying the terracotta and glazed bricks.

LAUNCESTON.—The new town hall at Launceston, opened by the Lord Chancellor on Friday, is 90ft. long by 43ft. 6in. wide, and seats 800 persons; it is one of the largest public rooms in Cornwall. The Tudor style, of civic character, has been chosen by the architects. The hall is entered from the Municipal Buildings on one side, and from a porch on the other. The principal front faces the Castle and main approach to the borough from the railway station. At the other end, internally, is the platform, having ladies' and gentlemen's retiring-rooms, with external entrances and lavatories, &c., adjoining. The roof is of hammer beam construction, with a ceiling formed in cants above the arched form of truss, with moulded ribs at the intersections. There are large openings in the ceiling for the efflux of foul air, which is drawn off through trunks in the roof of Boyle's air-pump ventilators on the ridge. The walls are plastered internally above a bold dado of pitch pine. The building is of the local stone, contrasted with doorways, mullioned and transomed windows and copings, of Bath stone from Monk's Park quarry. In the main front there is some characteristic foliage carved by Mr. Harry Hems, and a shaft has been placed at the point of the gable to receive, it is hoped soon, a life-size statue of the Queen. The roofs are covered with Delabole slate. A fire-engine house has been erected close to the hall. The contractor for the whole is Mr. E. Rendell, and the total cost, exclusive of land, is rather over £2,000. The buildings have been erected from the designs and working drawings, and under the direction of the joint architects, Messrs. Hine and Odgers, Plymouth, and Mr. O. B. Peter, Launceston. Mr. Waymouth acted as clerk of the works.

METROPOLITAN BOARD OF WORKS.—At the meeting of this Board, held last Friday week, applications were received from candidates for the appointment of district surveyor for the district of Charlton, Lee, and Kidbrooke, in succession to the late Mr. James Collis. There were 32 candidates, and the voting was taken by ballot. The number was in the first place reduced to five—viz., Mr. W. L. Spiers (36 votes); Mr. W. J. Hardcastle (31); Mr. W. H. Stock (27); Mr. H. H. Bridgman, C.C. (23); Mr. M. L. Saunders (19). A second ballot was taken, resulting in the election of Mr. Spiers. Mr. E. Mossop upon the subject of bribing vestry officials then introduced a deputation from the Vestry of Chelsea, who presented a memorial asking the Board to insert in one of their Bills to be submitted to Parliament in the next Session a clause which should make the person who offered the fee or reward mentioned in section 64 of the Metropolis Local Management Act, 1855, liable to penal consequences. In support of the memorial, Mr. Arthur Cooke reminded the Board that some time ago it was publicly mentioned that officers in the service of the Chelsea Vestry had been invited to accept commissions on parochial contracts, and the surveyor to the vestry, who made the allegations, was subjected to an action for libel in consequence. The suit fell through, but the matter cost the vestry a sum of £30. It was not merely that attempts at bribery had been made, but the members of the vestry had reason to believe that in some cases the attempts had been successful, and one of their officials had been dismissed for that reason. The vestry were of opinion that something should be done to prevent bribing practices, and suggested that the Metropolitan Board should introduce a clause into their General Purposes Bill, or introduce a special Bill to meet the case, so that persons who attempted to bribe officers of the vestries and district boards might be brought within the law. The memorial was referred to the Works Committee for consideration and report. The same Committee was also instructed to consider and report as to the desirableness of inserting in one of the Board's Bills a clause giving power to the Board when forming new streets to provide that all the ancient lights and other easements interfered with by the new buildings erected shall be dealt with by compensation and not by injunction.

NEWCASTLE-ON-TYNE.—The memorial stone of the College of Medicine was laid on the 4th inst. Messrs. Dunn, Hansom, and Dunn, of Eldon-square, Newcastle, are the architects. The first contract has been carried out by Mr. Walter Scott, of Newcastle, for £2,000. The second contract, which provides for the completion of the sections of the building at present to be constructed, is in the hands of Mr. S. B. Burton, whose tender, about £15,000 in all, was the lowest submitted. The building replaces an older college, which has been acquired by the North-Eastern Railway Company. The complete design provides for covering the whole of the site, leaving a quadrangle in the centre. The western and southern sides are not being built at present, but will contain space for the extension of the physiology, laboratory, and animal pathology departments, and a wing containing a residential hall for fifty students. The college now being erected consists of the principal (north) front, facing Bath-road, and the east wing. This wing contains the anatomical department, and is practically cut off from the other buildings. On the ground floor is the dissecting-room, 70ft. by 30ft., lit by a "ridge and furrow" roof. Adjoining is a large locker-room and lavatory, and both are floored with asphalte. On the same floor is the anatomy theatre (for 150 students) and professors' private room. Above is a bone room, 20ft. by 20ft., and a room, 20ft. by 15ft., for the curator of the museum. Direct access is provided to the museum from the anatomy wing. There is a basement containing a summer dissecting-room, 20ft. by 20ft., two rooms, 41ft. by 30ft. and 30ft. by 28ft., for comparative anatomy, a mortuary and infection-rooms, with private yard; also a heating vault, coal cellar, and store-rooms. The internal walls of this wing are entirely faced with glazed bricks, and foul air is extracted by heated shafts. The whole building is warmed by coils in the various rooms. The main front contains the entrance, in the centre, under a tower, with oriel window, and through a vestibule into the hall and staircase. Right and left of entrance are rooms for the porter and registrar. The remainder of the ground floor is occupied by the council and professor's room, 35ft. by 25ft., materia medica room, 25ft. by 25ft., and smaller lecture theatre, 38ft. by 25ft. A staircase of oak, with double flights of steps, leads to the upper floor, which contains the library and examination hall, 80ft. by 35ft., and the museum, 60ft. by 35ft. The walls and ceilings are panelled in oak and plaster. In the upper part of tower is a smoking-room for students. The building is designed in the Elizabethan style. The mullioned windows are being carried out in stone, and the walls and dressings in red bricks and terracotta, the former being supplied by the Normanby Brick and Tile Co., Middlesbrough, and the latter by Messrs. Doulton and Co., of Lambeth. Mr. Relph is the clerk of works.

SHUSTOKE.—The parish church of St. Cuthbert, which was partly demolished by fire, through lightning, on the 1st of June last year, was reopened on Monday week by the Lord Bishop of Worcester. The roof of the nave and chancel, the windows, and all interior furniture—including the pews, font, pulpit, and organ—were consumed by the flames, one of the bells—the treble bell—was cracked, and, with the exception of that of Sir William Dugdale, the great antiquarian, all the monuments, in the possession of which the church was so rich, were hopelessly disfigured and injured. The church was also injured by lightning in 1801. The church has now been completely restored and partly rebuilt at a cost of £6,000. Messrs. G. F. Bodley, A.R.A., and Garner, of London, were appointed architects, and the con-

tract was taken by Messrs. Stephens and Bastow, of Bristol, who have been represented by Mr. Charles Stacey; while Mr. David Knight has acted as clerk of the works. The old Norman font, which fell a victim to the flames, has been replaced by a new one—an exact copy of the original—and presented by Mrs. and Miss Dugdale, of Blyth. A new pulpit of richly traceried design in oak, with a stone base, is another special gift. The upper part of the chancel arch has been rebuilt with carved corbels on either side, that on the south side representing Edward I., and that on the north Queen Victoria. On the outside of the east belfry window the mitred head of St. Cuthbert has been reproduced.

South Shields.—The works in connection with the laying out of the South Marine Park at South Shields, from the designs of Mr. Matthew Hall, the borough engineer, are approaching completion. During the summer an ornamental terrace, 400ft. long, and facing Sea View, has been constructed. The wall is built of dark red bricks, relieved by stone piers, and is surmounted by cast-iron balustrading, with stone pedestals at intervals of 20ft. The lower portion of the park is approached from the terrace by means of broad flights of Aberdeen granite steps. Mr. F. Mackey was the contractor, and Mr. J. Peebles, the landscape gardener, has laid out the flower beds and walks. An addition to the North Park is in contemplation, ground facing the Lawe Cottages having been secured, and the designs prepared by the borough engineer. To complete the South Park, a road 50ft. in width, and forming a straight thoroughfare from Ravensbourne-terrace to the beach, is about to be made. This road will form the southern boundary of the park, and is to be constructed by the Harton Coal Company, who are inviting tenders for the work. South Shields now possesses two public parks, and these, with the pier promenade, the stretch of level sea beach from the pier to Trow Rocks, the salt water baths, and other attractions, should place the town in a position to compete with neighbouring seaside resorts.

Woking.—The foundation-stone of Christ Church, near Woking Station, was laid on the 10th by the Duchess of Albany. The ceremony was conducted by the Bishop of Winchester. The church will be built of red brick and stone, with wide and lofty nave and no aisles; when completed, will seat about 800. The character of the work is 13th century, from the designs of Mr. W. F. Unsworth, Poet's Corner, Westminster. The contractors for the first section of the work are Messrs. James Harris and Son, of Woking.

CHIPS.

On Wednesday week an organ, built by Messrs. Hill and Son, of London, at a cost of £250, the gift of Mr. Arthur Ashton to St. Editha's Church at Church Eaton, Staffs, was dedicated.

New board schools in Shakespeare-street, Loughborough, Leicestershire, were opened last week. The buildings are of red brick, with Hollington stone dressings, and are Tudor in style. Mr. G. Hodgson, M.I.C.E., was the architect, and Mr. W. Needham, of Loughborough, was the builder.

A new reservoir is being constructed at Woodcock Hill, Harefield Grove Farm, for the storage of water for Rickmansworth waterworks. The contractor is Mr. Collins.

The City Commissioners of Sewers decided on Tuesday to take immediate steps for the completion of the widening of Ludgate Hill on its south side, and, with this object, to serve notices on the leaseholders and occupiers of the houses numbered 37, 39, 41, 45, and 47, for the acquirement of these interests. It was also resolved to repave the carriage-way of Cheapside with asphalte, at an estimated cost of £3,600.

The ratepayers of Denny and Dunipace have adopted a report by Messrs. Kyle, Dennison, and Frew, Glasgow, for utilising Garvald Burn as a source of water supply. The estimated cost is £5,700.

The Earl of Harewood has given a very valuable site, containing 3,127 square yards, to the new parish of St. Luke, South Stockton-on-Tees, on which it is proposed to erect schools, parsonage, and church. Mr. Weatherill, architect, Stockton-on-Tees, has been commissioned to prepare the necessary drawings.

The Bishop of Nottingham is having a new altar erected in Lincoln Cathedral at his own cost.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Association of Public Sanitary Inspectors.—The first meeting of the fourth session of this association was held at the Westminster Town Hall, on Saturday, when Mr. Hugh Alexander, of Shoreditch, chairman of the Council, delivered his inaugural address. He pointed out that the association had grown in popular estimation, and urged that the vibration of public thought and sentiment upon health questions had been very clearly indicated in many ways. The full ripeness for legislative action had been clearly manifested in the report to the Royal Commissioners, and also by numerous Bills and suggestions directed to the amendment of the existing sanitary law. A report on this subject had been drafted and presented by their Council to the President of the Local Government Board, and had been received most favourably. The report declared that the most essential amendments required in sanitary law to secure efficient administration were—(1) That sanitary officers should be duly qualified, and should only be removable from their position by local authorities for misconduct, neglect of duty, or proved incompetence. (2) That sanitary officers should be held more directly responsible for the abatement of nuisances, and should be required, on thir own responsibility, to serve notices on behalf of local authorities, requiring all necessary works to be done for that purpose, such notices to be read to the local authority or committee appointed for such purpose at their meeting, and if approved should be adopted, and proceedings ordered to be taken for the abatement of nuisances. Penalties to accrue from the date of inspection notice. (3) That more simple, stringent, and summary powers should be given for the abatement of nuisances; and, lastly, that a minimum rate of salary should be enacted for sanitary inspectors. A testimonial was presented to Mr. G. B. Jerram, of Walthamstow, on his retirement from the position of chairman of the council, which he has held since the formation of the association. Mr. Jerram, in acknowledging the gift, expressed his satisfaction that the cause of sanitary reform was gaining ground in public estimation, but said at present sanitary inspection in the metropolis, as well as in the provinces, was inefficiently performed.

Birmingham Master Builders' Association.—The annual meeting of this association was held on Tuesday. Mr. J. Bowen presided, and there were also present Messrs. G. Twigg, W. J. Whittall, G. Raby, E. Giles, Albert Smith, and E. J. Bigwood (secretary). The annual report stated that the committee regretted that they were unable to record any permanent improvement in the state of the trade, which continued at the same dead level as for the past six years. The association having given notice to the operatives of a general reduction of wages, meetings were held with each branch of the operatives, but no progress was made. Eventually, arbitration having been rejected, the matter was settled at the existing rate of wages for three years; the whole of the operatives accepting an amended arbitration rule, and the stonemasons and plumbers agreeing to the insertion in the wages rule of the words, "Superior and inferior men to be rated by the foreman or employer." The balance-sheet showed £14 8s. 4½d. to the credit of the association. Mr. Alfred S. Smith was unanimously elected president for the ensuing year, Mr. C. H. Barnsley was appointed vice-president, Mr. W. J. Whittall was re-elected treasurer, Messrs. Thomas Barnsley and W. Sapcote were reappointed auditors, and Mr. E. J. Bigwood was reappointed secretary. In the evening the members met at dinner, Mr. J. Bowen, the retiring president, in the chair.

Birmingham Architectural Association.—On Friday night about five hundred ladies and gentlemen attended the conversazione and exhibition of architectural drawings, held at the Assembly Rooms, Edgbaston, in connection with this association, which was founded in 1873, and at present is the only provincial society affiliated with the London Architectural Association. The papers and designs submitted in Birmingham are in all cases the same as those submitted in London, and in addition to this the whole of the class drawings executed in London are forwarded to Birmingham for the inspection of the students. The London A.A. Library is also equally available to Birmingham men. There are at present seventy members in the society, this number being an increase of five on the year. The exhibition of drawings lent by members and friends of the association was exceptionally good, and included representations of most of the recently erected local buildings of note, and in addition there were drawings of prominent buildings in different parts of the country. Numerous water-colours, pencil sketches, cartoons, monumental brasses, and photographs were also shown. One of the features in the display of photographs was a fine collection representing works by Burne-Jones. The chief of the drawings, &c., were lent by the following:—Messrs. Aston Webb, W. H. Bidlake, W. Millard, F. Evans, Osborn and Reading, Henman and Timmins, Proud and Faulkner, Essex and Nicol, D. Arkell, Dunn and Hipkiss, J. J. Bateman, J. Cotton, M. B. Adams, J. A. Chatwin, V. Scruton, George and Peto, Crouch, Butler, T. W. F. Newton, W. Hale, Hawley Lloyd, H. Naden, W. Lethaby, Phené Spiers, M. J. Landsell, Ingall and Son, J. P. Osborne, R. W. Edis, J. A. Cossins, J. Brooks, J. Douglas, E. J. May, A. Lee, J. Oldrid Scott, Freeman Smith, A. B. Phipson, Wood and Kendrick, and C. E. Bateman.

Edinburgh Architectural Association.—The Council of the Association announce that they have secured more accessible and otherwise more convenient rooms, situated on the ground floor of No. 42, George-street, where in future the business of the Association will be conducted; the honorary secretary's private address is, as heretofore, 5, North St. David-street. The opening conversazione of the Association was held in the new meeting place last (Thursday) evening, when an address was delivered by Mr. Hippolyte J. Blanc, president, and the prizes gained by students last session were distributed. The twenty-ninth annual report of the Council, submitted at this meeting, stated that the Association had been efficiently maintained during the past session. The progress in all departments had been conspicuous, and the position of the society more firmly established. At the commencement of the financial year the members numbered 276, and during the session 65 names have been added to the roll; while, owing to decease and resignation 39 names have been withdrawn—showing a nett increase of 26, or a total of 302. The financial condition of the Association is satisfactory.

Glasgow Philosophical Society.—The eighty-fifth session of this Society was opened on Thursday, the 4th inst. Dr. J. B. Russell, Medical Officer of Health for the city, who occupied the chair, delivered the presidential address, remarking that it was exactly a quarter of a century since he received his diploma as a member of the Society. Dealing with "The Sociological Aspects of Sanitation," he remarked that it was sometimes hinted that the work in which a medical officer was engaged was opposed to the laws of the universe, or rather to the doctrines of Herbert Spencer, expressed by such phrases as "the survival of the fittest," and "the selection of species." He argued that, granted the most unfit died from epidemics, round every case of this kind there survived groups more or less unfit from the results of the diseases. Under those conditions the most efficacious method of promoting the survival of the fittest was to prevent diseases by the removal of their causes. Passing in review the various communicable diseases, he emphasised the facts—(1) that diseases had the property of lateral extension; (2) they also had the habit of endemicity; (3) that local habits which fostered endemicity were artificial, and, therefore, remediable; (4) that even those communicable diseases which could scarcely be said to live upon uncleanliness were all aggravated thereby; (5) that the soil which sustained the communicable disease in the endemic condition, and promoted the epidemic expansions was the same which produced general unwholesomeness; and (6) that whoever persisted in a manner of life calculated to promote communicable disease injured himself first, but next, and with certainty, his neighbours. The practical question was, "What am I to do with my dirty neighbour?" and the

principle to be strictly followed, both in the case of the personal and the local administrative unit, must be not to do anything for them, but to make them do it for themselves, and bear the expense as they would reap the benefits.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The following is a syllabus of the meetings of this society for the present session :—

Nov. 14.—"Victorian Architecture and Originality," by Basil Champneys. Exhibition of Drawings by W. Hill, F.R.I.B.A.
Nov. 28.—"The Legal Registration of Architects," by J. W. Connon, F.R.I.B.A.
Dec. 12.—Annual Dinner of the Society.
Jan. 16, 1888.—"The Transitional Periods of Gothic Architecture," with illustrations, by Rev. Canon Scott.
Jan. 30.—"Some Simple Principles Connected with the Strength, Stiffness, and Stability of Structures," Professor Barr, B.Sc., C.E.
Feb. 6.—"Horace Walpole, his life and times, with some notice of the condition of Architecture and the Fine Arts during the latter half of the 18th century," by W. H. Thorp, A.R.I.B.A. Exhibition of Drawings by J. H. Greaves.
Feb. 20.—Subject to be announced. Aston Webb, F.R.I.B.A. Exhibition of drawings by T. Butler Wilson.
March 5.—Subject to be announced. Wm. Emerson, F.R.I.B.A.
March 19.—Nomination of Officers.
April 30.—Secretary's Report; Election of Officers; Members' Soirée.

MANCHESTER ARCHITECTURAL ASSOCIATION.—At the opening meeting for the present session, held on Tuesday week, an address was delivered by the president, Mr. A. H. Davies-Colley, A.R.I.B.A., in which he reported that the R.I.B.A., which he looked upon as the central architectural body, had been much improved, and had gained much in the confidence of the profession at large by the introduction of younger men, all, or nearly all, of whom had done excellent work in the London Architectural Association. Union was strength, and it was important that architects should present an unbroken front if they intended to make architecture a close profession—a proposition in which he concurred. The president then considered the steps which an architect's pupil should take to fit himself for subsequent life, pointing out that the more competent and useful a youth made himself the more responsible would be the share of the work allotted to him, and he would thus have the opportunity of having mistakes corrected for which, if only discovered when he was in independent practice, he would have to pay heavily. In sketching, he urged students to spend a large proportion of the time allotted them to a general examination and study of the building—work which was harder and more troublesome than draughtmanship; it was also desirable to approach the work with a mind half teachable and half sceptical, so as to note the good and weak points in a design. The student would gain much power from making drawings of the figure and sketching from nature.

NORTHERN ARCHITECTURAL ASSOCIATION.—The first meeting of the winter session was held in the Old Castle, Newcastle-on-Tyne, on Monday last. Mr. G. G. Hoskins, of Darlington, the president, occupied the chair. Mr. Hoskins, in his opening address, referring to the Imperial Institute, said such an important and national building should have been thrown open to competition to all architects in the kingdom. When the R.I.B.A. by-laws were settled upon, a definite basis would be offered for federating existing societies with that body. He strongly approved of obtaining Parliamentary powers for the compulsory registration of architects, but thought the working of the scheme should be left with the Institute. He hoped the members of the Association would give a strong expression of opinion in favour of this course. Drawing attention to the Exeter Theatre disaster, he said useful lessons were to be learnt from such calamities. Mr. Hoskins then read a long and exhaustive essay upon theatre construction, treating the subject chiefly from the fire prevention point of view. A vote of thanks was passed to the president on the motion of Mr. Tillman. Mr. Rich moved that the paper be printed. Mr. W. J. Moscrop, of Darlington, in seconding, suggested a special night should be set apart for its discussion. The hon. sec. (Mr. F. Rich) read an interesting paper suggesting the subjects for lectures and discussions during the session. Short discussions arose as to the Leeds Architectural Association and the case of Mr. Birchall, and upon the conditions for a local competition at Birtley, Durham.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—J. H.—L. and N. W. R. Co.—G. W. R. Co.—T. L. B.—W. W. and Son.—W. S. and Co.—A. and T.—S. W. H.—W. K. and Co.—E. J. S.—W. B. W. and Co.—J. and E. G.—H. M.—J. C.—G. and H.

THE "BUILDING NEWS" DESIGNING CLUB. (In reply to numerous inquirers, we cannot undertake to send the rules of the club by post, or to answer individual inquiries. The rules were published in the "B.N." of Nov. 4, and intending competitors must get that number.)—R. M. B. (All drawings sent to us are returned—whether used or not.)

Correspondence.

ARCHITECTS' ASSISTANTS' PROVIDENT FUND.

To the Editor of the BUILDING NEWS.

SIR,—Perhaps Mr. Chambers and your readers may remember my letter some time back, in which I appealed to assistants generally to help me in the formation of a committee to consider the "Federation Bill" with regard to the parts that affected assistants. I do not suppose that many of your readers will credit it, but it is nevertheless a fact that I received only *two* answers; therefore the movement fell through.

Will assistants kindly note this, and bear it in mind, that if the above referred to movement is to succeed, they must wake up and exert themselves, not wait for others to do work for their good, and without assisting them whatsoever? From my own personal knowledge the majority of assistants I am acquainted with will be only too glad to avail themselves of the benefits conferred by such a fund; but they do not show any disposition to help to make the proposal an accomplished fact any further than becoming members when it is formed.

All manner of tales are told to excuse themselves from taking a forward part. One who was old and big enough to knock me down with ease, stated he was too young; and another said he had no experience in anything of the kind before, therefore could not, but would be pleased to join the society when formed; another lived too far away; another thought there were better men than himself to be got—in fact all manner of lame excuses. I have come to the conclusion that assistants are—shall I say, too *modest?* They also put me in mind of a tale I heard, which I may as well relate. An American State official was so in the habit of receiving "considerations" to assist him in deciding which party to vote for, that when a measure was introduced that would bring about, should it become law, a considerable increase of his salary, he could not be prevailed upon to give his vote in favour of it till he had received the accustomed "consideration."

I do not wish to infer that assistants require to be bribed; but this I will say, that a considerable amount of coaxing is required to get them, *not* to stand in the light of their own interests. I have not the slightest doubt but it is the dear and laudable wish of every assistant to be in practice on his own account some day. A moment's consideration must convince them that if they are so neglectful of their own interests, they will never be able to attend to those of a client. I hope now assistants will *wake* up—they have slumbered long enough. I wish Mr. Chambers every success in his undertaking, and shall attend the meeting on the 18th inst., when I hope to see a crowed room.—I am, &c.,

R. W. COVENTRY DICK.

34, Lady Somerset-road, Kentish Town, Nov. 7.

A MODEL EXIT FOR THEATRES.

SIR,—Mr. S. Beale, in your last, suggests a scheme for dividing laterally all public stairs which he will find is identical with a scheme of mine set forth at length in a letter to your journal, 23rd Dec., 1881, and commented on in your editorial in following issue (30th). The suggestion was not favourably received, and I did not go into the matter further. The objections seemed to be, firstly, that the public would not submit to the restrictions involved by the "gangways" (what a suggestive phrase that is), and, secondly, that such barriers would be broken down in the rush. The latter objection, I think, is fully overcome by Mr. Beale's idea of carrying up supports to the ceiling.

At all events, I am glad Mr. Beale brings the matter again into notice, and it is very satisfactory to learn that there is a prospect of carrying the suggestion into practical effect.

What I wished to convey was the fact that there can be no safety in any moving mass of human beings, except in military "alignment." Mr. Beale's little sketches show this much better than my letter. It illustrates the difference of a "march past" and a "disastrous rout."

A good commander could get his division out of a public building in 10 minutes or less. An ordinary assemblage, without military instinct or guidance, can only have this instinct or direction imparted by *artificial contrivance* as before suggested.—I am, &c.,

D. BRADE, F.R.I.B.A.

SIR,—Mr. Sydney Beale's idea about exits to a theatre is not quite novel. Last year the magistrates of this city (Manchester) insisted on new staircases being built to the upper circle and gallery. These I superintended, and provided each with a central handrail, but different in detail to that shown in Mr. Beale's sketches. Of course, I entirely agree with his views.—I am, &c.,

EDWARD SALOMONS, F.R.I.B.A.

31, South King-street, Manchester, and 39B, Old Bond-street, London, Nov. 8.

THE FUTURE OF THE ARCHITECT, AND "THE ARCHITECT OF THE FUTURE."

SIR,—Professor Corfield, in the letter which you published last week, informs us that he has been practising as a sanitary expert for more than 15 years; and it may interest him to know that I "comparatively unknown," specified and carried out drainage works years before that. I do not, however, propose to reply to the Professor by *tu quoque*. I have, as the lawyers say, "got what I wanted," and that is his refusal to prove, in the only certain way possible, that he possesses the knowledge of which he pub-

licly asserts architects are ignorant. His reason or excuse for not doing so is that my request was "impertinent"; but he must not complain if I and others place a different interpretation upon the grounds of his refusal. He need not have introduced the name of Professor Roger Smith into this discussion; but I will at once inform him (it may be from my obtuseness and want of due appreciation, or it may be because I am so much in the *working* world), that I hold a "Grimthorpean" opinion of "Professors" of all kinds, and I am quite unable to rise to professional flights of fancy, particularly in matters architectural. Mr. Roger Smith, however, is a well-known architect, and, from my knowledge of him, I should say that he would be one of the last men to "follow the example of the Professor" in an endeavour to bring architects into disrepute.

As to attending lectures on sanitary subjects, I may say, without any feeling of disrespect to Professor Corfield, that so far as I am concerned they will not be lectures given by him; because I can obtain precisely the same information in a much easier, and perhaps more reliable way, by going to my bookcase and taking down certain books on sanitation, of which it is just possible the Professor, in the course of his 15 years as a "sanitary expert," may have heard, written by a certain S. Stevens Hellyer, of Newcastle-street, Strand. *Verbum sap.* Life, however, is too short to waste much of it in discussions with professors of sanitation, sanitary experts, and inspectors of nuisances. I take leave of Professor Corfield with a profound bow, and I pass on to the much more important observations of Mr. Hugh Roumieu Gough.

I may at once tell Mr. Gough that I have also got from him "what I wanted," and that is the practical admission that his statement in the *Times* of October the 1st was a general one, and thas he is not able to quote a distinct case of that "ignorance of the most elementary laws of sanitation" which he laid at the doors of "very many so-called architects," and thus, I think, we may leave the purely "sanitary" part of the points raised. Mr. Gough, in his earnest letter in last week's BUILDING NEWS, reverts to the question which naturally arises out of the perpetual attempts to lower architects in public estimation, and he vigorously urges forward the proposed Registration Bill, to procure, as he says, "the compulsory registration of all at present in practice or duly qualified, and a test examination or examination for all hereafter desiring to enter the profession, not the Institute merely." That such a Bill is needed I am distinctly of opinion, unless it can be clearly shown that membership of the R.I.B.A. carries with it, in the public eyes, all that such a Bill would procure, that is, *a properly trained and qualified architect.* There is, however, to my mind, a danger in founding the necessity of the Bill too much upon sanitary considerations, because the Legislature will very properly say that *existing* Acts of Parliament in London, and in the provinces, fully provide for the protection of the public in such matters, and, from my knowledge of such Acts, I can say that, if properly administered, they most certainly do. There is the far larger question of the general aptitude and technical skill of the architect in *all* branches of his business, and it is to that the profession must adhere, and prevent, by every means in its power, its place being occupied by those not possessing such qualifications.

I cannot see in what way the profession could possibly be the worse if such a Bill as was drafted by the Society of Architects—modified, of course, as further study of the subject might suggest—became an Act of Parliament, and I cannot see why the unqualified support of the Institute should not be forthcoming to secure the passing of a Bill having for its object the welfare of the profession at large; whether or not the bulk of that profession had enrolled itself at No. 9, Conduit-street. I respond willingly to Mr. Gough's appeal, and ask others to do so; and, putting aside *all* that has gone before, let us, in the most open and candid way, see what it really is which leads the Institute to hold aloof. I know that a Registration Committee has been appointed by the Institute, but I have not yet heard that it has even met. If it has met, it would be interesting to hear the conclusions at which it has arrived; if it has not, it would be well that further time should not be lost in bringing it together.

To my mind, however, the more satisfactory way of settling, once for all, the present petty squabbling between the Institute outsiders and the Society of Architects is to request the Council of the Institute to grant the use of the meeting room for a conference between outsiders, the members of the Society of Architects, and the members of the Institute; the proceedings at which should be thoroughly open, and be reported. One or two active members of the Council of the Institute should be present armed with distinct authority to officially reply to questions which it may become necessary to ask, and the main object should be to affiliate, so far as possible, and with due regard to the dignity of all, those bodies, to whom certainly good does not arise from the present estrangement. If the result of that meeting should show irreconcilable divergence, we shall at least know the true grounds of that divergence. If, on the other hand, a *modus vivendi* should show itself, I have not the least hesitation in saying that great benefit to all will result, and the prospect of passing a Registration Bill will be nearer than it has yet been—that is, of course, assuming that it is hereafter conclusively determined by the profession that such a Bill is necessary.

I have already extended this letter to a greater length than I desired, and that must be my reason for not replying to "M. M.," further than by saying that he is an optimist; I am a pessimist, at least, so far as the "Future of the Architect" is concerned.—I am, &c., WM. WOODWARD.

7, Duke-street, Adelphi, W.C., Nov. 7.

THE PAINTER-ETCHERS' EXHIBITION.

SIR,—In your notice of the exhibition of the "painter-etchers," which appeared on the 4th inst., there was a sentence which might lead to misconception. After a reference to one or two etchings, the artist's name being given in each instance, there followed: "An effective view of 'Dordrecht,' by C. S. Van Gravesande (14), has a great depth of tone. The thirteen illustrations to Bunyan's 'Pilgrim's Progress' (19) are replete with life and character."

This might lead to the credit of these, the "Pilgrim's," etchings being given to C. S. Van Gravesande, while, in point of fact, they are the work of Mr. William Strang, who is only referred to generally about three-quarters of a column further down. By giving publicity to this, you will greatly oblige.—I am, &c.,

Nov. 7. IAN.

COLLAPSE OF WALLS OF BURNING BUILDINGS.

SIR,—The expansion of brick by fire heat may be estimated at rather above half that of wrought iron; and of mortar at about one-fourth more than that of wrought iron. The mortar joints in the wall may occupy, say, one-fifth to one-sixth of the height of the wall. There is no accurate data as to the maximum heat developed at Whiteley's fire. It, however, depends on the nature of the contents, &c., consumed, and the accumulation of draught currents. If there is free lime, &c., in brick or mortar, there is added to the expansion more or less disintegration, which would become not the least potent cause of collapse. We may assume that the interior surface of the brickwork exposed to the fire expanded, say, 1in. in 8ft. or 10ft., vertically and horizontally, which would produce a distortion by buckling, or curving inwards, dish-like, of the inside half-thickness of wall, both vertically and horizontally, leaving for a time the outside half-thickness (say, for convenience of description) not much disturbed; in the meanwhile, air gets in between these inside and outside half-thicknesses, or slices, and it may become gradually expanded by heat and help to force them further apart until the whole wall collapses.

In setting iron girders the usual practice appears to be to build the ends solidly in the wall to act as a tie; but by having cross flanges at ends the wall may be built close to these on side towards interior of building, and space left for expansion on their outside; but this space is of no use without the ends of the girders are set upon rollers or rockers, as is done for bridge girders, because the rigidity of wall would not be sufficient to withstand undisturbed the expansive pushing out, or horizontal thrust, of loaded girder end if resting upon a rough bearing plate or block.

If building timber joists into walls, it is a safe method to bevel off the upper corner equal to the bearing of the end in the wall, which allows the projecting portion of joist, if broken accidentally, to drop down without disturbing the wall, by the leverage which it would exert if built in the wall in the usual way.—I am, &c., ALEX. BLACK.

PROFESSORS OF SANITATION.

SIR,—A suggestion has been brought forward to create a new order of beings, "Professors of Sanitation." There are at present two kinds of professors: The University professor, a man of profound learning and general culture adopting some department of knowledge as his special province; the other a person practising some calling of a professional nature, but not a recognised profession—a phrenologist, for instance—who, possessing no degree by which to distinguish himself, adopts the meretricious title of "professor." With which of these *would* the new professor rank? That will, of course, depend upon the merits upon which his claim is based. Let us examine these.

The principles of house sanitation or drainage are both few and simple: That the main drain be laid external to the premises; means of access to same provided for inspection or insertion of rods; disconnection from public sewer and ventilation. That is the whole theory of house drainage, about which there is such an absurd fuss. This may be acquired by anybody of ordinary intelligence in the short space of three months, or even less, and another three devoted to sanitary appliances, water supply, &c., would exhaust the subject. Now, there is no experienced bricklayer who has not a thorough knowledge of house drainage far exceeding that—and considerably more practical—of any (with exceptions) medical practitioner, and this constitutes but a fraction of his knowledge. Sanitary plumbing, again, is the everyday duty of the plumber, and many matters, similar to a bricklayer, apart from this is he acquainted with. These combined, then, are the materials from which we are to construct the new *professor*. And well might he be termed so. We need scarcely say it is a gross absurdity.

Every qualified architect undergoes now a test in sanitary science, and it is all but impossible for any person in the profession, were he to read but the professional journals, to be otherwise than acquainted with sanitary science.

In conclusion, I have engaged in many sanitary works of magnitude in which the employer or client has consulted a friend or medical man, and in general the theoretical fads advocated have been the laughing-stock of every mechanic, and even labourer, engaged upon the work.—I am, &c., CHAS. R. GUY HALL.

15, High-street, Kensington.

SANITARY ASSOCIATIONS AND HOUSE DRAINAGE.

SIR, — "C. E." has not brought forward any independent evidence to support what I called an untrue assertion — viz., that "it is now generally acknowledged that no traps should intervene between the trap on the main outlet and the soil-piping." When engineers require to make, or do make, untrue statements to support their recommendations, there is likely to be something wrong about them.

In Mr. Rottenburg's case, it was not a question of whether the work should be done without or with a trap at foot of each soil-pipe; but the work was already done with the trap, and said work had been previously examined by the former engineer of this association and no objections stated, so that the new engineer was virtually finding fault with his predecessor, as well as with my plan of doing things. I have no reason to suppose the new engineer is any better than the old one—who has begun business on his own account as a civil engineer.

As "C. E.," on page 673, would have us infer that sanitary associations, "unlike tradesmen or patentees," have no temptation to cause unnecessary expense to their clients, I wish to know where the temptation came from, in this case, to recommend unnecessary work on the

plea of pretended improvement? The Association, so far as I can judge, wished to make itself appear smart at the expense of its client; but it calculated without its host. It has yet to justify its recommendation.

As to the general question of trapping off the soil-pipes from the drain where practicable, or of using said soil-pipes to ventilate the drain, I do not think "C. E." has said anything to show that the sanitary associations that practise the latter style do their work in the way that is best and safest for their clients. To make the paltry expense of the traps an excuse for their omission is all humbug. I do not find my customers object to that. They are generally quite willing to trap off the servants' closet from the nursery and visitors' closets, &c., and *vice versâ*. In 1876, two years before the formation of any of these sanitary associations, I published, in the first edition of my book on "Plumbing and House Drainage," a diagram showing the soil-pipe ventilating the drain; but this was principally for tenement houses where the soil-pipe was often in centre of house, and it was difficult to get a trap, or one would not be put in. I called this a second-rate style of doing the work. For villas, mansions, or where it could be done, and the client was willing to pay for the best job, I recommended trapping off the soil-pipes and keeping the drain air out of them, and so in many cases not allowing either sewer or drain air to get access to either soil-pipe, waste-pipe, or rain-pipe of the house. Surely common sense teaches that if sewer and drain airs are dangerous, it is better to keep both out of the house entirely if it can be done.

"C. E." very foolishly, in my opinion, says no, while also telling us he puts the main trap as near the sewer as possible—as if he wished as much drain air as possible to blow into the house should a closet trap lose its seal; or, as often happens during severe frost, an earthenware closet gets broken, &c. This, therefore, is the real issue between us: whether it is safer to do the work so that no drain air can get into the house supposing the closet or soil-pipe leaked, or whether it should get in.

Allowing it to get in is equivalent to placing a barrel of gunpowder below each bed and then boasting that there is not the slightest danger, because they have looked in half-a-dozen times and the barrel was still there; but when they go the seventh time it may happen that neither barrel nor client are there.

On page 674 "C. E." misrepresents me in saying, "Mr. Buchan speaks about disease germs from one untrapped, ventilated, soil-pipe passing into another, and through closet trap." I never said "through closet trap"; but through a leak in the soil-pipe or at the closet, as often happens, or through closet trap, of course, *if its water seal fails*, the water seal of closet, in "E. C.'s" style, being the only protection to the house and its inmates from the drain.

For "C. E." to tell us that putting in a trap at foot of each soil-pipe is adding "innumerable traps," is all nonsense; while, instead of bewildering the average householder, the trap shows at a glance where the soil-pipe joins the drain, &c. His objection is also fanciful that the air would blow out, so as to be offensive, at the fresh-air inlet outside when the closet was used, especially if the trap is near a window. Now, how is it, it does not do so in practice? Simply because if the trap is near a window the fresh-air inlet is placed to one side, or some other precaution taken to avoid offence. Moreover, this *momentary* puff-out would be into the outer air outside of the house. And it is not air from the main drain, but merely the fresh air that was going in and up the soil-pipe momentarily blown back.

As to "C. E.'s" objection to the trap at the foot of the soil-pipe that it "seriously interferes with the flushing force of the water," that is all imaginary as regards my traps, while its benefits otherwise counterbalance that objection a hundredfold.

In closing, I beg to state that, in my opinion, a house, even well done on "C. E.'s" system, is ten times more dangerous to the inmates than one well done on the sectional system. I had to put the first sanitary association right, when it began its work in 1878, by using a couple of old-fashioned traps, stuck end to end, as a first-class sanitary appliance. This was stopped, and, instead, they used my traps. Then they thought the paraffin test better than my smoke test. They had to give this up, owing to not being able to localise leaks easily with it, and take to the smoke test. They had better follow me a third time, to the advantage of their customers, and trap their soil-pipes too, or either myself or the rising race of registered plumbers may do it instead.

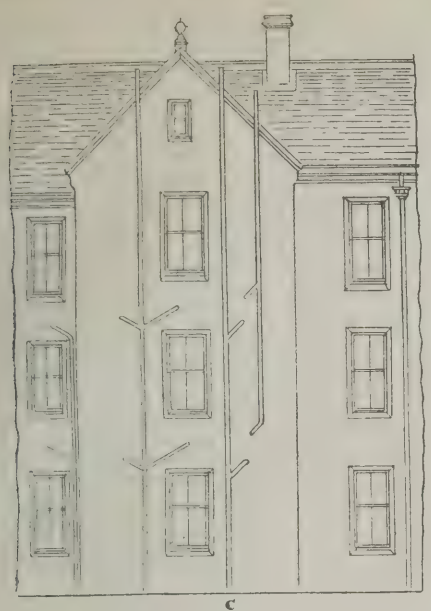
I think the sudden and lamented death of the late Professor Fleeming Jenkin, F.R.S., the originator of these sanitary associations, through blood poisoning, should have taught the engineers of said associations the lesson that they cannot be too careful in keeping disease-breeding germs at as respectful a distance as possible.—I am, &c.,

W. P. Buchan.

Sir,—Referring to the letter from "C.E." in the Building News of 28th October, I shall be glad if you will allow me space for a few remarks in reply to the statements made.

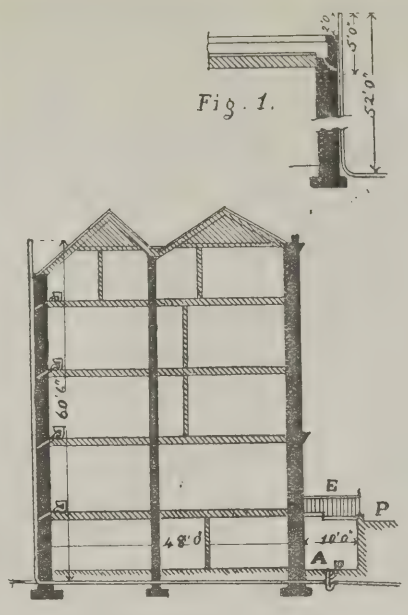
Mr. Buchan deserves all the credit we can give him for his improvements in connection with sanitation, and it does not become "C.E.," as a sanitary engineer, to boast of the number of houses examined every 12 months. There is every probability of the numbers decreasing annually, as public confidence, so far as I am able to judge, at the present time is not increasing towards the sanitary associations, and gentlemen directly connected with some associations appear to be rather doubtful of the "improvements recommended" by their own engineers. I am informed that the president of a sanitary association allowed a good ordinary plumber to renew and overhaul all the drains and sanitary arrangements connected with his house, without consulting the engineer of his own association.

"C.E." admits there are exceptional cases where the soil-pipe should not be used as drain ventilator, as when the pipe is placed inside a house, &c.



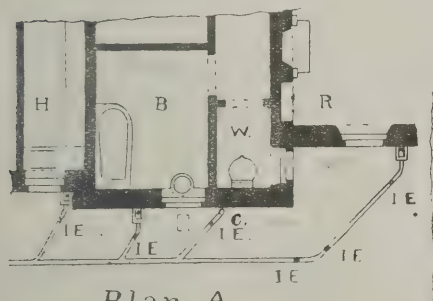
In my opinion, if a soil-pipe placed and fixed on the outside of a wall does not require to be disconnected from the tail drain, there is no reason why it should be disconnected, if fixed on the inside, and "C.E." has not given any explanation in support of his statement. The bugbear of "great danger" by using inside soil-pipes is simply an idea, and without the slightest foundation in the execution of all good work. There are many advantages obtained by placing the pipes inside the walls; as they are protected from frost and accidents of all kinds, and when properly arranged and fixed, the pipes can be tested and examined at any time; and the practice is equally as good a protection against drain gases as if placed on the outside, when good materials are used, and the joints are well made. The soilpipe, with all its branches to w.c.'s, should be tested with water and made perfectly water-tight, and this is very simply done by inserting a plug at the foot of soilpipe; capping, or pluging all the branches to w.c.'s, and filling the pipe with water at the top above the roof, or where it is intended to terminate; and the water test should be left in the pipes for, at least, five or six hours, to make sure that the whole system, including the ventilation-pipe, is perfectly water-tight. I never find any difficulty in applying the above test before the w.c.'s are connected, and before the soilpipe is connected to the fireclay drain. After the connections are made, the smoke-test should be applied, to prove the joints at w.c.'s, and the soilpipe-joint to drain; therefore, in the first place, with well executed work the soil-pipe can with safety be placed inside the house; and another advantage is the more rapid current of air passing through the pipe, owing to the pipe being warmer inside the house, especially during cold weather.

"C. E." states that the arguments do not justify the use of traps at the foot of each soil-pipe. As this is the main question at issue, I would like to explain the facts fully, and by to state that it is not supposition or theory, but the results of careful tests; and when doing so I beg to refer to the accompanying drawings. Plan A. Elevation A and the section, drawn to a small scale, shows the system generally adopted by the Sanitary Associations, and the reference letters on the plans refer to the same apartments—viz., W, w.c., B, bathroom, H, housemaid's closet, R, the corner of a room, and the plans show the 1st and 2nd floors, and a scullery on the ground floor, with grease box at the front of window, as indicated by the broken lines on the two plans. The drains shown on plan A is the summit of the drainage system of a mansion house, or large villa, and between the soil-pipe shown and the disconnecting trap there are two soil-pipes, A and B, before we reach soil-pipe C, shown on the plans. The Sanitary Associations condemn the traps at foot of soil-pipes as shown at T on plan B, and they ventilate the drains by means of the soil-pipes as shown at C, plan A, with the result, that by flushing soil-pipe A, there is a downward current of air in B and C, and the same applies in A and B when one of the w.c.'s connected to C is used and flushed with water—that is, when the w.c.'s connected to one of the soil-pipes are flushed the current of air in the whole system is reversed, and the large quantity of stinking air, from soil-pipes and drain, is forced before the water, &c., and out at the grating of disconnecting trap, and the discharge often continues for a considerable time at the rate of from 10ft. to 300ft. per minute, according to the height of soil-pipe, fall of drain, and the quantity of water, &c., passing through the pipes. Another defect in this system is due to the small air gratings used by the sanitary associations, at the disconnecting traps, which are not large enough to admit sufficient air for two or three soil-pipes off one drain, and very often the gratings are only sufficient to supply one, or, at the most, two of the 4in. pipes. I have often observed, when testing the currents of air, that the long tail drain does not give a circulation of air nearly so good as the short length of drain at the foot of soil-pipes, therefore the system recommended by Mr. Buchan has the advantage of a much better circulation of air in the pipes, a much safer distribution of the discharge of foul air from soil-pipes and drains when flushing w.c.'s, and during the passage of water from waste pipes, &c.



Referring to the discharge of foul air, it has four escapes on the system condemned by sanitary associations, whereas, on the system they recommend, the foul air has only one point of escape. When the drainage is arranged on the sectional system, as shown by plan B, each soil-pipe is used without affecting the current of air in any of the rest, and not affected by the discharge of water from baths, basins, and sinks, &c., as is the case when the soil-pipe is connected to the drain direct, without a trap.

"C. E." wishes to maintain that the traps of earthenware closets are reliable against siphonage; but I much regret to state that such is not the case, as some of the traps are very unreliable and very easily siphoned, and, therefore, admit drain gases into the house; and as this is one of the most important details, every care should be taken to secure the most reliable drain trap and place it near the foot of soil-pipe, as shown on Plan B, at T, and the summit of the drainage system ventilated by means of pipe V, shown on plan B and elevation B. "C. E." also objects to the traps, as they interfere with the energy of the water. I consider this a very weak objection, as we cannot get much flushing power from two or three gallons of water passing from the cistern through a 1½in. pipe (1½in. being the largest generally used) to the w.c., through the w.c. trap, and one or two bends before it reaches the vertical soil-pipe, and another bend at the bottom before it enters the drain; when entering the drain the water is much scattered, and its flushing energy reduced to a minimum.



Some other means should be provided for flushing and cleaning the drains, and I prefer a tilting basin, which can be supplied with water as circumstances may permit; and if placed in a position as shown on plan B, at T B, with a large basin hinged and fitted in a manhole in such a way that it can easily be removed when it is necessary to inspect the drain, and covered over with a plate or other air-tight cover. "C. E." objects to the noise of water in the traps when placed at the foot of soil-pipes; but this can be prevented, and arranged in such a way as will not give offence to the most sensitive person. And "C. E." calls the arrangement of traps near the house "dangerous"; but I maintain there is less danger with the sectional system than there is with the faulty system recommended by the sanitary associations.

Plan, B.

Elevation, B.

Fig. 1.

I was asked a few days ago to examine a a house where the drains and plumber work had been renewed a few months ago according to the specifications and under the directions of a sanitary engineer from a sanitary association, and, as I had occasion to take some notes and sizes as shown on the section, E is the main entrance to house, P the street pavement, and A the area about 10ft. wide. The sanitary engineer has placed the air grating as indicated near A, which is the nearest possible position to the entrance door. The drain is continued through the house, and receives soil-piping from five w.c.'s, and to the same drain is connected, after passing through traps, all the wastes from sinks, baths, basins, and washing-tubs, and, owing to the passage of so much water in the drain from the various fittings, the drain gases were forced towards the trap in area and out at the grating placed near the main entrance door. When I went to the top of soil-pipe to test the current of air, the anemometer showed generally a downward current in the soil-pipe and ventilation-pipe off the w.c. traps, and it was after waiting a considerable time I got an upward current for a few minutes at the rate of 83ft. per minute, and the temperature at A in the area was 56°, at the top of the soil-pipe 59°, and the air inside the pipe at top during the upward current 64°. The w.c.'s were flushed with about two gallons, and the flushing of one nearest the top of house caused a downward current of 250 lineal feet in the 4in. soil-pipe and 3½in. ventilation-pipe in less than one minute, and discharged at the grating in area near the front door. This is a very bad arrangement, discharging such a large quantity of stinking air at a point where every precaution should be taken in the opposite direction.

Again, let us consider for a moment the advantage of disconnection at the foot of soil-pipes in all such cases; (1) the discharging of any bad smell from the soil-pipe during flushing of w.c.'s at the back of house, and at a safe distance away from the house, and not at the front entrance; (2) a regular current of fresh air constantly passing up the soil-pipe, except when flushing the w.c.'s; (3) the risks arising from siphonage reduced to a minimum by the large fresh air inlet near the foot of soil-pipe, giving a rapid upward current in the pipe, when the trap prevents all drain smells from entering the soil-pipe and ventilation-pipe off w.c. trap; and such a preventive was urgently required in the house referred to, owing to the kind of earthenware w.c.'s used. I observed that the flushing of some of the upper w.c.'s siphoned 1in. of water out of the trap on principal floor.

At the side of the soil-pipe shown in section, was situated a bath and basin waste-pipe, also serving as a rainwater-conductor, and discharging into an open trap; and when I tested the current of air passing up this pipe the anemometer showed an average of 273ft. per minute against 83ft. in the soil-pipe; and the latter was extended about 4ft. above the wall head. I think that this alone should be sufficient to show "C. E." and his brother engineers belonging to other associations the advantages of disconnection from a long tail drain, such as I have described, and shown in the section.

"C. E.," when referring to my former letter on this subject, states that it "contains mere assertions unsupported by argument." I simply stated the results of a few tests and experiments, and I did not think it required any argument to show "C. E." that when a downward current takes place, the air must find an outlet, and the greater numbes of outlets so much the better when placed in a proper position.

There is another point in "C. E.'s" letter deserving a remark or two, where he hints at tradesmen and patentees having pecuniary interest and the sanitary associations no such interest. I have no doubt but the statement is correct so far as the associations are concerned; but I question the assertion when applied to some of the engineers of some associations. I refrain from giving particulars in the meantime, and beg to inform "C. E." that people who live in glass houses should not throw stones.

"C. E." states near the end of his letter that the system he advocates is "thoroughly tested hundreds of times yearly, and is found to be perfectly satisfactory under all conditions"; and he omits to state the process of testing—viz., when the work to be tested was executed under the directions of a sanitary association's engineer, he first goes over the whole house and fills all the traps with water to prevent smoke from passing the traps into the house, and after the traps are well filled the smoke test is applied, and, of course, does not show any siphoned traps, and any escape at a bad joint can be filled up with putty or clay. Every sanitary engineer may not act in the way I have stated—and I hope the majority do not; but it is well known that some do so.

Fig. 1 shows a rainwater pipe used as ventilator of a short tail drain. The top of the pipe was finished about 2ft. above the top of parapet, with a branch connection to platform gutter 5ft. below the top, and the full height of pipe is about 52ft. When the anemometer was placed on top of pipe, it showed an upcast current of 160 lineal feet per minute. When the branch to gutter was filled up to prevent any air passing into the pipe, the upcast current was 70ft. per minute—that is 90ft. lineal of air drawn down the branch from gutter to the pipe by means of the upward current of warmer air passing up the pipe. This shows a cheap and safe system of ventilating a tail drain, and proves that the upcast goes straight to the top, and draws an additional supply at branches, as shown, instead of discharging any drain gases at the branches.

Referring to iron pipes, used by some of the sanitary associations for drains: By using iron, the first outlay is much more than the cost of the best glazed fireclay. After the coated iron pipe is used for the passage of sewage, it gives off a very bad smell, and begins to rust inside and outside in a few months. I consider that work of this kind is a great waste of money, to begin with, will prove a great nuisance, and must be removed in a few years.

This is the third period, during 150 years, that iron has been used for drainage, and the best of the solutions, used at the present date to protect the iron does not appear to be much better than the kind of coating used many years ago.

The sanitary engineer, when describing inside fittings, generally recommends everything larger or smaller than stock patterns; and when it happens that the work is executed according to the engineer's specification, the proprietor has often to pay the cost of new patterns for articles which are no improvement on general goods and fittings as made by the best manufacturers. The word "fad" used by "C. E.," on 674, is applicable to work of this kind, as practised by the sanitary associations at the expense of a too-confiding public.—I am, &c.,

Nov. 2. CLERK OF WORKS.

Intercommunication.

QUESTIONS.

[9456]—**Crushing Weight of Stones.**—Will you kindly inform us what is the crushing weight per cube inch of the following kinds of stone—viz., Portland "Base" and "Whit Bed," Bramley Fall, York, Bath, Beer, Doulting, Aberdeen granite, and Cornish granite?—R. C.

[9457.]—**Sham Stained Glass.**—Can any reader give me the particulars of a method of imitating stained glass other than covering it with "Vitremanie"? I imagine I have seen an account of a simple method quite recently brought out.—TERTIUS.

[9458]—**Plumbing and Hygiene.**—Does not the Plumbers' Company of London hold examinations for the purpose of registering master plumbers? If so, would you kindly furnish me with the name and address of the secretary so that I may write for particulars? I should also feel obliged if any of your readers could give me data and show how to work out the following question in hygiene, given in the Honours stage of the Science and Art Exams. of 1887:—How much work in foot-tons can be expected from a diet consisting of cooked beef, 10oz.; bread, 24oz.; butter, 1oz.; and potatoes, 20oz.?—HYGIENE.

[9459.]—**Concrete Roofs.**—What is the least substance with safety of concrete to cover a flat roof on a shop to be projected about 18ft. by 22ft. wide? It is suggested that 3in. of concrete gauged about 1 to 8, and laid on match boards, with planed joists 9 by 2, 30in. apart, would be sufficient. If it is covered again with a coat of the cheap British asphalte or pitch, and that could be coated with ½in. of cement plaster in summer, if the asphalte got soft with the sun, and there would be more means to do it then. 2nd. If a basement was put in at once, nothing less than 14in. for retaining side walls I suppose should be put in, or concrete walls. The object of using concrete instead of zinc or lead is that it may not cost more and be better if it is used for a store for materials or to keep plants in tubs, &c.—H. MELBOURNE.

[9460.]—**Formula.**—Will any reader inform me if 4·4ft. is the correct value of T in the formula—

$$T = \sqrt{\tfrac{1}{5} R^2 + \tfrac{3}{5} R^2 + \left(\frac{W}{H}\right)^2} - \frac{W}{H}$$

When D = ·98ft. H = 6ft. R = 7ft. W = 2cwt.—H. B.

[9461.]—**Picture and Chimney.**—In the course of some alterations to a house I find that a picture is being damaged by the heat from a chimney. My client does not wish the picture removed if means can be found for stopping the mischief. Can anyone tell me of a suitable non-conducting material to put on the back of picture or on wall?—PERPLEXED.

[9462.]—**Stopping Wood Joints.**—I should be glad if any of your numerous readers could inform me the best way to stop the joints of a wood-block floor in which the blocks have shrunk considerably. I have used whiting and size, but I find they dry up and work loose in the joints. Cement is also objectionable.—SALISBURY.

REPLIES.

[9440.]—**Roof.**—On further examination of "Excalibur's" question, I infer that he means the roof to have framed couples without principals, each pair of rafters being tied together by collars with suspending pieces and longitudinal pieces 3in. by 2in. spiked to the upper and lower collars. If this is what he means, the chief strain would be where the lower tie or collar is framed to the rafters. Such a roof would answer, though I should have preferred a cross-braced couple as being more economical.—G. H. G.

[9441.]—**Early English Foliage.**—The foliage of the caps in the Trinity chapel of Canterbury Cathedral, which are examples of transitional work brought into this country by William of Sens, is a free treatment of the Corinthian acanthus leaves. This type of capital was much used in France at this period, and it was derived directly from Greek rather than Roman models. The builders of the Early English period used a stiff kind of foliage, the stalks of which seem to be growing out of the neck-mould of the shaft. This foliage was more or less conventionalised from natural leaves and flowers. At first small plants and grasses were chosen, and of these chiefly the buds and opening leaves, with their stalks thick and full of sap, were taken as models. Water and other cresses were favourite types, and the leaves and fruit of the oak, vine, and ivy. At a later period in the style the French artists worked from more fully-developed models. The ivy, vine, holly, maple, and wild rose are to be found in the rich carvings executed about this time. Later still, the natural leaves and flowers were more and more closely copied until we arrive at the graceful wreath-like foliage of the Decorated period.—A. C. W.

[9447.]—**Buenos Ayres.**—"K." will find a very interesting paper on Buenos Ayres in the "B.N." for Sept. 2nd, 1887, read before the English Literary Society of Buenos Ayres," by Frank E. Tnicke, architect, evidently practising in that town.—PUP.

[9450.]—**Masonry and Stone Cutting.**—In answer to the question put by Mr. Hanson, relatively to the strength of stone under efforts of flexion, such as in the case of architraves and door lintels, I beg to say that it is an absolute fact that both the Greeks and the Romans used the stone in such positions with its beds placed vertically, and such manner of using the stone also occurs in Mediæval buildings. My authority is "L'Art de Bâtir chez les Romains," by Monsieur Choisy, a thoroughly reliable work. M. Choisy is an engineer, and he has for years carefully inspected Greek and Roman structures on account of the French Government. As to the explanation of that fact, I believe we may consider a stone beam as, to some extent, resembling a timber beam formed of superposed layers of boards. If we take a beam 9in. by 9in. formed of nine layers of 1in. boards, neither glued nor nailed together, and place the beam with the boards horizontal. In flexion the boards act independently—they will slide over each other, and the beam will be able to bear nine times the bearing weight of one board. If we place the boards, vertically, then, as the resistance to flexion is proportional to the square of the depth of beam, each board will bear 81 times the bearing weight of one board, and the beam will be, therefore, 81 times stronger when the boards are placed vertically, as when they are placed horizontally. If the boards be glued together by some glue—which, for the sake of argument, we may suppose less resistent to shearing than the timber of the boards—the timber beam will then act exactly like a beam of sedimentary stone, and it is evident that its resistance to flexion will still be less when the boards are horizontal than when the boards are vertical.—LAWRENCE HARVEY, Teacher of Scientific Masonry City and Guilds of London Institute.

[9450,]—**Masonry and Stonecutting.**—The statement is made relative to "flexion." The conditions of a "wooden lintel" are not similar, hence not a parallel case. I am not aware of any sufficient data, experiments on a large scale, to warrant the statement. It may, however, be readily admitted that stones of the laminated class would offer a "greater resistance" on edge than flatwise. The advantage, however, is questionable, for, in this climate mouldings lying outside the plane of the face, would suffer considerably, while the risks attendant upon inaccurate bearing would be much greater. On the other hand, if the stones were not "seamy," but thoroughly homogeneous, such that the stone shows no signs of stratification and the quarry-bed difficult to determine except by the "feel," the advantage (divided by a safety factor) must be small. Mr. L. Harvey, in my opinion, was unfortunate on more than one point of his lesson, particularly in "working a block of stone, &c.," and succeeding paragraphs, and then in a dozen words smashing the method as it deserved to be. Why is not the word "archstone" as suitable as "voussoir"? Surely the need of technical education suggests simplicity, not confusion.—JOHN POWELL.

[9450.]—**Masonry and Stone Cutting.**—Stone of a sedimentary description used in a position subjected to a transverse strain will offer most resistance placed with the beds vertically and running parallel with the face as in the case of an architrave for example. This is not generally recognised in modern practice, and it is objectionable in exposed positions to place the stone face-bedded. A stone spanning an opening placed with the bed vertical, and running parallel with the plane of the opening, is somewhat analogous to a flitch beam supported at ends.—J. DAY.

[9452.]—**Norman.**—Durham choir is stated to have been built by Bp. Carilipha, 1093—1096, and to have been completed in 1128. Norwich was built 1096—1119.—G. H. G.

[9455.]—**Technical Education.**—Consult Mr. E. C. Robins' "Technical School and College Building," which contains particulars and detailed drawings of laboratories.—G. H. G.

CHIPS.

The City of London Court of Common Council, after a long discussion, have rescinded their recent determination not to appoint a City Architect in succession to the late Sir Horace Jones, but to select a City Surveyor at a salary of £800 a year. The motion was carried by 91 votes to 70, and it was further resolved to appoint a City Architect at a salary of £1,500 per annum.

The Committee of the Royal Irish School of Art Needlework, Clare-street, Dublin, have made arrangements for the holding of a Decorative Art Exhibition in Dublin next February.

Mr. Edward Augustus Gruning, F.R.I.B.A., of Gresham House, Old Broad-street, E.C., has been appointed as a Deputy-Lieutenant for the City of London.

The town council of Cardiff decided, on Friday, to place a bust of the late Alderman Jones, formerly a builder and contractor in the town, in the vacant niche on the staircase of the town hall.

A question as to the ownership of the stained-glass windows which were formerly in the banqueting hall at Oakwells Farm House, Bray, Berkshire, was before Mr. Justice Kekewich, on Wednesday and Thursday in last week. The windows, which were said to date from the time of Henry VI., had been removed to Mr. Grenfell's residence, Taplow Court; but a Mr. Smith claimed that he was entitled to them under a lease by which he undertook to pull down the ancient structure. Eventually it was stated that a settlement had been arranged.

On Saturday the Lord Mayor opened the new park at Kilburn, which will be called the "Queen's Park. It covers 30 acres of ground, and was formerly the property of the Ecclesiastical Commissioners. The plot was used, eight years since, as the place of the annual show of the Royal Agricultural Society, and was afterwards presented by the Commissioners to the Corporation in trust for the inhabitants of the locality. The Corporation has expended £3,000 in laying out the ground, in planting, draining, and in constructing footpaths, under the direction of Major A. Mackenzie, Superintendent of Epping Forest, and has determined to provide for the future maintenance of the park out of the proceeds of a legacy left by Mr. William Ward for charitable purposes.

The first section of the new church of All Saints, Peterborough, was opened on Tuesday week. Mr. Temple L. Moore, of Hampstead, is the architect, and Mr. J. Thompson, of Peterborough, the contractor.

LEGAL INTELLIGENCE.

THE CHUBB LOCK AND SAFE COMPANY V. JOSEPH WITHERS.—In the Chancery Division on Friday, Mr. Bunting, on behalf of the plaintiff company, moved, before Mr. Justice Kay, for an injunction to restrain the defendant (trading as Thomas Withers, of West Bromwich), and Mr. Appleyard, an auctioneer, of Hartlepool, from selling or offering for sale, or stamping, marking, or otherwise representing locks or safes to be the manufacture of the plaintiff company when they were not plaintiffs' manufacture. The evidence of Mr. Reeves, agent for the plaintiff company, showed that the defendant Appleyard offered for sale in Hartlepool locks which bore the name of Chubb upon them, but which were the manufactures of Withers. When Reeves spoke to him about it, Mr. Appleyard said the locks were Chubb's manufacture, as no one would dare to imitate them, as they were patent locks. The locks, however, were not Chubb's manufacture. With regard to the safes, the motion would have to be amended, as it appeared they bore the defendant's name and not that of the plaintiffs. The defendants were unrepresented, and his Lordship made the following order: To restrain the defendants from offering for sale any locks marked with the name of Chubb that are not Chubb's manufacture, and from marking or selling any such locks with the name of Chubb, and from otherwise representing that locks not of Chubb's manufacture are Chubb's locks.

RE W. J. BUXTON.—The bankrupt, described as of 10, Gray's-inn-square, architect and surveyor, applied last week before Mr. Registrar Giffard to pass his examination. His liabilities were returned at £7,146, and debts fully secured £4,005; assets, £422 10s. 8d. The bankrupt said that he commenced business in 1878 with £400 capital, and in 1883 he borrowed about £1,000, which was still owing. He built a large house at Sunningdale of the value of £4,000, but could not get a larger offer for it than £3,000, which barely covered the outlay. He did not discover that he was insolvent until the institution of the present proceedings. The Registrar allowed the bankrupt to pass his examination.

VALUE OF LAND IN THE CITY.—On Saturday the Recorder of London and a special jury heard at the Guildhall a claim for compensation, fixed at £25,000, made by the City of London Real Property Company against the City Commissioners of Sewers, which body had compulsorily acquired a piece of freehold land belonging to the claimants. The land in question was situated at 159, Fenchurch-street, and 21 and 22, Lime-street, and was purchased by the claimants at auction in March, 1885, for the sum of £16,700. The total area was 1,374sq.ft., on which the claimants intended to erect central offices for their own business. The Commissioners, however, propose to carry out public improvements in the locality, and require for this purpose 560sq.ft. of the land, which had been cleared of the former buildings and on which some progress made with the erection of the new structure. A number of professional witnesses were examined, who generally agreed that, though the claimants had not paid more than £12 16s. per foot for the land, it was now worth £16. They differed, however, materially as to the price which should be paid for the 560ft. proposed to be taken, the highest figure quoted by the surveyors for the Commissioners being £11,700. Eventually the jury awarded £11,400.

Mr. James Fullbrook, builder, of Studd-street, Islington, died on Monday, aged 57 years.

A font, sculptured in white marble, has just been placed in Ecclesall Church, Sheffield, as a memorial. The design represents a kneeling angel with outspread wings, supporting a large scalloped shell for holding the baptismal water. It rests on a platform of the same material, all highly polished. The work is by Mr. James Forsyth, of Finchley Newroad, London.

The memorial stone of the Jubilee Cottages in Old-street, Clevedon, Somerset, was laid on Friday. The building will accommodate four aged persons or married couples. There are four living rooms, 10ft. square and 10ft. high, entered from an open central porch, four pantries, and two double sculleries. The materials employed are red bricks, from Warne's Clevedon Works, for the walling, with gables in half-timber work. The architects are Messrs. Lingen Barker and Cross, of Weston-super-Mare and Clevedon, the builder being Mr. Dowland.

The Lord Bishop of Durham consecrated, on Tuesday, the new fishermen's mission church of St. Andrew, in the Croft, Hartlepool. It is of red brick, with stone pointings, and is seated for 230 persons. The church has been built from the designs of Mr. C. Hodgson Fowler, F.S.A., architect to the Dean and Chapter of Durham, at a cost of £1,300.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1715.

FRIDAY, NOVEMBER 18, 1887.

FAILURE TO COMPLETE WORKS.

THE inability of contractors to complete works at a given date proceeds from various causes. Those who undertake to carry out work at a low tender have a certain interest in not fulfilling their engagement as to time; the delay gives them the chance of throwing up their responsibility or of increasing the cost. Sometimes the contractor is unable to complete the work at the time specified owing to extras ordered, or through interference of employer or his architect; sometimes the drawings are not ready, and delay in ordering work is thereby caused. From whatever cause delay proceeds, those who put agreements into force need to be on their guard, or they may be led into expense. A dispute arising out of such circumstances has been reported, and came before Mr. Justice Butt the other day. The plaintiff, Rawles, sued the Hornsey Local Board for the value of materials and labour expended in sewering, metalling, and making good a road. He had entered into a contract with the Board to complete the work by January 21, 1886, at the price of £410; but this was not done, and the Board gave him an extension of time. At the end of the extended period the work still remained incomplete, and the surveyor of the Board, under a clause in the contract, gave the plaintiff notice to accelerate the rate of progress. This notice not being complied with, the Board took the works out of plaintiff's hands, and completed the road at a cost of £435. Thereupon the plaintiff claimed £328 odd. The Board replied that under the agreement they had a right to give notice and take over the works; but in the argument it was conceded that this clause provided only for the work not being proceeded with to insure completion by the specified time, and did not apply after the expiration of that time. The Board further disputed the value of the work executed by the plaintiff, and made a counter claim for the amount of their loss by his breach of contract. These were the points of the case, which occupied a long time in discussion, and on which considerable evidence was taken. The Board has spent more money to complete the work than would have been the case if the plaintiff had fulfilled his contract, as they had obtained the advantage of a public tender. They had clearly not looked into their legal obligations before taking the course they did. After the time of completion had expired the defendants extended the contractor's time, and finding this time had been exceeded, took possession of the work and completed it. By thus extending the time the Board had clearly waived their right in the matter; the contract was no longer binding on the plaintiff. In giving judgment, Mr. Justice Butt held that the defendants, having "waived their right to take possession of the works on the plaintiff's failing to complete at the specified time, were not justified at law in taking possession when they did; but found that the plaintiff was not entitled to any damages, he having been a gainer, rather than a loser, by being turned out, as the work could not have been completed for the contract price. As regards the plaintiff's own breach of contract in not completing in time, his Lordship said that the damage which the defendants had shown arose from their own act in taking possession of the works, and not from the plaintiff's breach." The plaintiff's claim was to be taken as on a *quantum meruit* for the work he had done, and from the evidence and prices in the bill of quantities, his Lordship found the plaintiff entitled to no more than £157 6s. 8d., for which amount judgment was given with costs. The decision is instructive in several points. The extension of time was an admission on the defendants' part that operated against them. Having given the contractor an extension of a few weeks, they practically acknowledged the time was not sufficient, and closed the door against further interference on their part. Instead of taking possession of the works at the close of the contract period, and charging the contractor with the expenses, they allowed him to go on in his own manner before putting into execution their threat. The custom of taking over the work of an unfinished contract is not common, and, at best, is an undesirable proceeding, often attended with loss. A new contract has to be prepared, or, if the work is undertaken at measure and value prices, the chances are that the employer is put to a great deal of expense and trouble without a very certain chance of recovering damages. When a contractor fails to complete, the employer has a remedy by law; he can rescind the contract, and maintain an action for damages against the contractor. In some cases the Court will enforce specific contracts.

The principle upon which the Court decided in the case of the Hornsey Local Board is that any interference on the part of the employer justifies the assumption that the parties have entered into a fresh contract. It is this principle that ought to be kept in view by those who are called upon to advise employers. A man contracting to do a work for a certain sum can recover nothing unless the work is performed, or it can be shown that the defendant has taken posession. A contractor cannot recover on a special contract unless it be performed. The time of performance or that fixed in building contracts ought to be very clear. If time is to be of the essence of the contract it should be so stated, or at least there may be circumstances that imply so much; but in the ordinary building contract it is very usual for the parties to agree to an extension of time without waiving the contract. A small delay in completion will not entitle the owner to hold back payment, though if the delay has been injurious the owner can only seek compensation in damages. Let us imagine a case where a builder undertakes to complete a house by a certain date for a certain amount but fails to do so; a week or two elapses before it is finished. In the meantime the owner takes possession of the house. It would be unreasonable to think the plaintiff has by such delay forfeited his right to compensation for the work done, and this was the ruling of Chief Justice Tindal in "Lucas v. Godwin." In accepting the house the owner admits that it is of some benefit to him, and such benefit is worth paying for. Of course anything, however unreasonable it may be, can be agreed to in writing: if it is a condition precedent that nothing shall be paid if the work is not done by a certain day, the contractor has to bear the cost; but building contracts are not so severely worded. In point of fact, the practical difficulties in the way of completion are increased by the ordering of extras, by the acts of employers, and other causes to which we have lately referred, and which all tend to mitigate the time condition, and make it easier for the contractor.

But, though the penalty is not often put into operation, those who frame contracts and conduct works ought to take a lesson from such a case as that to which we have referred. We will suppose a builder is proceeding very slowly with the work; the time for competition is near. Is the architect or employer justified in taking the building out of the contractor's hands and completing it? Of course, this will depend on the contract. When there is a clause to the effect that, "If it should appear to the architect that the work is not properly executed, or with due expedition, it shall be lawful for him to give notice to the contractor to alter or to expedite the work, and, if he fail to comply, to take the work out of his hands and to recover penalties," the architect can proceed after giving such notice. Most contracts provide that if the contractor shall delay the performance (except on account of strikes, &c.) the architect may give him notice, and, in case of default of so many days, enter upon, and take possession of, the works, and employ other persons to complete same, &c. In some specifications a time is mentioned for enforcing forfeiture clauses, or providing for the avoidance of the contract, and we here give a form which this sometimes takes:—"It is hereby agreed that should the architect be at any time dissatisfied with the nature or mode of proceeding with, or at the rate or progress of, the work or any part thereof, he shall have full power to procure and make use of all the labour and materials which he may deem necessary, deducting the cost of such labour and materials from the money that may be then due, or that may become due to the contractor. It is expressly agreed that the possession of this power by the architect shall not in any degree relieve the contractor from his obligation to proceed in the execution of and to complete the works with the requisite expedition, or to maintain them; and it is provided that should the contractor fail to proceed in the execution of the works in the manner and at the rate of progress required by the architect, the contract shall, at the option of the employers, but not otherwise, be considered void, so far as relates to the work remaining to be done; and all sums of money due to contractor, together with all materials and implements, and all sums of money named as penalties, shall be forfeited to the employer, and the amount shall be considered as ascertained damages for breach of contract."

This clause is not often inserted in agreements, but, as we have pointed out, the architect in exercising his powers under the clause must do so before the time specified for the completion. In "Walker *v.* London and North-Western Railway" this clause was introduced, the particulars of which case may be found in the Law Reports. The right of rescinding contract must be exercised also in a manner that cannot be mistaken; it would be unreasonable and unfair to serve the notice on a builder who had been led to expect leniency owing to various acts of the employer or his architect. But the point to be urged is that if notice is given it should be acted upon. By allowing time to elapse the builder is led to expect that the delay will be overlooked. The circumstances attending the case to which we first alluded point to the same conclusion, that the employer by not putting in force the power to take possession of the works at the right time, cannot reasonably do so afterwards.

THE VALUE OF THE MODEL IN ARCHITECTURE.

NO one will question the use of models to the architect, though whether the art of modelling should be added to his other accomplishments is quite another matter. We have invariably urged the value of a model of a design, such, for example, as that made for the Tower Bridge, and those of Piccadilly Circus and the new Admiralty Offices. An assemblage of buildings or a quadrangular group can be very inadequately represented by elevations. For example, a quadrangular plan would require at least two elevations, one external and one internal, of

each block, and if there are four blocks, there would be eight elevations required. Should there be two or more courts inclosed, the number of elevations would be increased. And this detailed manner of representing the façades is, after all, exceedingly unsatisfactory, as the elevations do not give any idea of the grouping or connection, of the depth or perspective appearance of the blocks; each is, as it were, a mere stamp of the façade on the flat. A model, in short, is the only means of obtaining the solid effect, the light and shadow, or, so to speak, "colour" of a building, and on this primary ground alone we consider it deserves the attention of the architect. Mr. J. C. L. Sparkes, in his paper on "Modelling," read at the Architectural Association, referred to the latter value of the art. What he says about the distribution of light and shadow on any detail such as a panel, is true enough. The designer is called upon not merely to design in the abstract a certain feature, as a panel or relief ornament, but to design it with reference to the lighting and its position in relation to other parts. He takes as an illustration the diverse treatment a panel designed to be exposed on the sunlit side of a building requires when its mission is to decorate a staircase with a narrow top-light; also the totally unlike conditions of out-of-door statuary exposed to strong sunlight and that in darkened churches or under canopies. Each of these positions calls for a different arrangement of ornament or drapery. For example, the strong sun-lighted façade may be well broken up in its plan, and the carving deeply undercut, to give shadow and relief; the interior wall, or panelled relief, which only gets an imperfect or subdued light, ought to be treated broadly, and the direction of the light considered. In dark interiors, breadth of surface and the avoidance of elaborate relief is essential, as the fretted ornament would look nearly black under these circumstances. Who has not noticed the almost black appearance of the carved diapering in the spandrels of the arcades in Westminster Abbey? Every detail, as Mr. Sparkes said, ought to be modelled to contribute to the general tone, whether in the direction of breadth and light or fretted dark.

But the author might have gone further, and pointed to the value of "tone" to the architect. It is one of those things which he seldom thinks about. What we mean by this word is the proportionate quantity of light to shade in a building—the distribution of light and shadow. Take, for example, the river front of Greenwich Hospital, which is always a pleasing object in the scenery of the river. The great quandrangles which open to the river contribute their share of shadow, and impart an agreeable tone or colour to the façade when seen with the sun on it. The river front of Somerset House is another example of this play of light and shade; in the latter the masses occur in the open loggias or screens of columns. In a general view of St. Paul's the west front is well broken up by the shadow of the portico; even the dome, when lighted up by the sun, has a charming "tone" due to the peristyle which encircles its base, giving apparent solidity and pleasingly varying the sharp lights of the columns and circular cornice by the shade of the inter-columnar spaces. Imagine a lofty dome and tambour without a peristyle, with nothing to break the monotony of light on its rotund surface. It is needless to multiply examples of the value of shadow, about which Ruskin has spoken so eloquently in his "Lamp of Power." The masses of broad shadow on a building, or in a sculptured tympanum or panel, serve the same purpose in each. They give value to the flat surfaces which otherwise would become monotonous and barren; but it is in the distribution of these masses that the artist's work can be distinguished. The masses of shade should never be evenly distributed, but if possible placed in points to give variety and breadth to the composition: here and there should be deep shadows to impart gradation to the masses of lesser shade. It is this art of giving tone and point to a façade or a group of sculpture that can nowhere be so well studied as in the model. The sculptor indeed models his work in clay, but the architect is left to the resources of drawing entirely. Only the real artist can deal with masses of solids on the flat; the average architect cannot give what his design lacks, and so we have to endure yards, indeed, miles of uninteresting architecture. As we have before said, the study of the solid is neglected in England, and one great aid is lost to the artist. In Germany, as Mr. Lawrence Harvey said, modelling is one of the subjects in every architectural school; in France it is also made to subserve instruction in design and construction. The value of a knowledge of the subject is at least important; it enables the architect to combine and group his buildings in a manner which only perspective in the hands of an expert can approach, and as one speaker said, it helps the architect to "see round the corner of his work." Schools of modelling are rare here. The South Kensington Museum affords the architectural student the best study of work in the solid that we know of, and some excellent plaster and cardboard models are to be seen at the Crystal Palace. Till design is taught on a different and more reasonable system than it is in England, the architectural pupil will be an unwilling learner, and the architect will be content to study his effects on paper, notwithstanding the admitted advantage of being able to realise the solid effects, light and shade, of a design by modelling it. There is no need that the architect should himself turn modeller, but that he should encourage the art whenever he can, and, in all complex arrangements of buildings and streets, have models prepared. For instance, it was an impossibility to realise the appearance of the proposed buildings on the site of Piccadilly Circus without a large scale model. This was prepared, the surrounding buildings also of the Circus being made of cardboard and coloured to represent the façade, by which means a better idea of the proposed erection could be obtained than by drawings. Apart from the pictorial value of models so prepared, there is a different use for which they are invaluable to the architect, namely, a technical means of arranging and studying combinations which the old masters used in their works.

THE UNIFORM TESTING OF PORTLAND CEMENT IN GERMANY.

WE have frequently directed attention to the want of some standard regulations for the testing of cement, and we have recently received a copy of the revised rules drawn up by the German Cement Manufacturers' Association, and published under the authority of the Minister of Public Works in July last. In issuing this document in the form of a circular, addressed to all interested in the use of Portland cement, special attention is drawn to the fact that the prescribed tests are intended only for the comparison one with another of various samples of Portland cement, and not for the investigation of the properties of Portland cement, as contrasted with other kinds of hydraulic cements, in which latter case many other matters would require to be studied. We append a complete and literal translation of these regulations.

GERMAN REGULATIONS FOR THE UNIFORM DELIVERY AND TESTING OF PORTLAND CEMENT.

Signification of Portland Cement.— Portland cement is a product arising from the calcination of an intimate mixture of lime and argillaceous materials, as essential ingredients, burnt to a state of incipient vitrification, and subsequently reduced to a powder as fine as flour.

I. *Packages and Weights.* — Portland cement should, as a rule, be packed in standard casks of 180 kilograms tare, and about 170 kilograms nett, or in half-casks of 90 kilos tare, and about 83 kilos nett. The tare weight is to be marked on each cask. If the cement is required in casks of a different weight, or in bags, the tare weight must be plainly marked also on these packages. Leakages, as also differences in weight of individual packages, must not exceed 2 per cent. of the total weights. The casks or sacks must, in addition to the weights, bear the name of the maker or the factory mark upon each.

Rationale of Par. I.—In the interests of buyers, and for the security of trade, the employment of a uniform weight (per cask) is strongly insisted upon. For this purpose, the weight selected has been that of 180 kilos tare = about 400lb. English, as being by far the most usual and commonly employed cask throughout the world.

II. *Time Needed for Initial Set.*—Portland cement, according to the purpose to which it is to be applied, can be furnished either of a quick-setting or slow-setting description. Slow-setting cements are such as require two hours or longer to take their initial set.

Explanation to Par. II.—In order to determine the time required for the set of a cement, a slow-setting cement is stirred up with water for three minutes to a stiff slip; a quick-setting cement is stirred for one minute only, and the resultant slip is spread out in a single operation upon a glass plate so as to form a pat about 1·5 centimètres thick, sloped off round the margin to a thin edge. The slip used in the production of this pat should be of such a consistency that the mixture, when placed upon the glass plate with a spatula, should only spread towards the edges of the plate after repeatedly tapping the plate; in most cases from 27 to 30 per cent. of water will suffice for this purpose. As soon as the pat has hardened sufficiently to resist a slight pressure with the fingernail, the cement is to be considered as having become set. For the accurate observation of the time required for the initial set and for the determination of the beginning of the setting, which (as the cement must be stirred up before the setting commences) is a matter of importance in the case of quick-setting cements, a standard test-needle is to be employed; the weight of this cylindrical needle is 300 grams, and its area is equal to 1 square millimètre; it ends with a flat extremity cut off at right angles to the axis. A hollow metal cylinder 4 centimètres in height and 1 centimètre in diameter is placed upon a glass plate and filled up with cement slip of the above-described consistency. The interval of time which elapses before the standard needle fails to penetrate the entire depth of the pat is noted as that required for "the beginning of the set." The time which elapses before the test-needle no longer makes any perceptible impression upon the solidified cement is taken to be "the time needed for the set." As the set of the cement is influenced by the air-temperature and by the temperature of the water with which it is gauged, higher temperature tending to increase the rapidity of set, and low temperature retarding the same, it is recommended, in order to obtain uniformity in results, to undertake these determinations at a mean temperature of from 15° to 18° Celsius (59 to 64 Fahr.) both for air and for water. During the setting period a slow-setting cement ought not to develop a sensible amount of warmth, while, on the other hand, quick-setting cements may indicate a considerable increase of temperature. Portland cement when stored for some time

becomes slower in set, and increases in tensile strength, when kept dry and free from contact with draughts. The still-prevalent opinion that Portland cement deteriorates in quality by long keeping is therefore erroneous, and specification clauses which insist upon freshly-ground cement should be abolished.

III. *Fixity of Volume.*—Portland cement must be unchangeable in volume. As a decisive test of this fact, a pat of neat cement made up on a glass plate, and protected from too rapid evaporation, placed in water for six hours and kept under observation for a lengthened period, must show no warping or hair-cracks at the edges.

Explanation to Par. III.—In carrying out this test the pats prepared from slow-setting cement for the determination of the setting time must be placed in water after 24 hours, or, at any rate, after they have become completely set. In the case of quick-setting cements, a shorter time only need elapse. The pats in the case of slow-setting cements must be protected from draughts and from sunshine until they are thoroughly set; this can best be done by placing them in a covered box, or beneath a damp cloth. By this means the formation of cracks due to evaporation, which generally arise in the middle of the pat, and which might be mistaken by the uninformed for cracks due to blowing, is avoided. If during the induration under water any warping or fine hair-cracks at the edges of the pat become manifest, these appearances indicate most undoubtedly the blowing of the cement—that is to say, that in consequence of an increase in volume a splitting of the particles of the cement is taking place, with a gradual loosening of the cohesion at first obtained, which may lead to the entire disruption of the material. The appearances due to blowing generally become manifest in the pats as early as the third day, but in all cases an observation extending over 28 days is sufficient.

IV. *Fineness of Grinding.* — Portland cement must be ground so fine that a sample of the same should leave a residue at the utmost of 10 per cent. on a sieve of 900 meshes to the square centimètre (5,806 per square inch). The thickness of the wire forming the sieve to be half the width of the mesh aperture.

Rationale and Explanations to Par IV.—One hundred grams of cement to be employed for each sieve-test. As cement is scarcely ever used without sand—in many cases, indeed, with a large quantity of sand—while the cohesive strength of a mortar is the greater the finer the cement of which it is composed is ground (as then more particles of the cement come into play), therefore the fine grinding of the cement is of the utmost importance. These considerations would appear to indicate that the fineness of the particles should be uniformly tested with a fine sieve having meshes of the stated size. It would, however, be erroneous if the value of the cement were alone to be determined by the fineness of the grinding, as indifferent, tender-burnt cements far more frequently occur in a fine state of subdivision than good, hard-burnt cements. But the latter, even if coarsely ground, would indicate greater cohesive strength than the former (tender-burnt cements). If the cement is to be used mixed with lime, it is advisable to employ a very finely-ground, hard-burnt cement, the higher cost of producing which will be repaid by the vastly improved quality of the mortar.

V.—*Tests of Cohesive Strength.*—The cohesion of Portland cement is to be determined by testing a mixture of cement and sand. The tests must be applied upon a uniform system both in tension and compression, and by means of test samples of the same shape, of similar section, and with apparatus of the same pattern. Besides these tests, it is advisable to determine the cohesive strength of the neat cement. The tests of tensile strength must be conducted with test samples, having an area of fracture of 5 square centimètres (0·775sq.in.), the tests for compression with cubes with a superficial area of 50 square centimètres (7·7503sq.in.)

Rationale of Par. V.—Because it is not possible uniformly to form an empirical opinion concerning the behaviour of the cement with sand by means of the tests of the cohesion of the cement without the addition of sand, especially when it becomes a question of comparing the results of samples of cement from different factories, it has been decided to undertake the test of the cohesive power of Portland cement by means of a mixture with sand. The trial of the cement without the addition of sand is advisable when it is required to compare samples of Portland cement with mixed cements and other hydraulic cementing agents, because by means of the neat test the special excellence (the cohesive strength peculiar to Portland cement, and in which the remainder of the hydraulic cements are inferior to it) is more prominently manifested than when tested with sand. Although the relative proportional strength when tested by compression and that when under tension varies in the different hydraulic cements, the tensile strength is very commonly employed alone to indicate the value of different samples of hydraulic cements. This, however, is liable to give erroneous results; as, moreover, in practice the mortar depends most prominently upon its strength when in compression, it is evident that the only reliable test must be that of its cohesive strength under compression. In order to obtain the necessary uniformity in the system of testing it is recommended that apparatus and utensils of the same pattern as those in use at the Royal testing station at Charlottenburg should be adopted.

VI. *Tensile and Compressive Strength.*—Slow-setting Portland cement must have a minimum tensile strength of 16 kilograms per square centimètre (227·5lb. per square inch) when tested with three parts by weight of normal sand to one part by weight of cement, after 28 days—one day in the air and 27 days in water. The compressive strength must be not less than 160 kilograms per square centimètre (2,275·7lb. per square inch). In the case of quick-setting Portland cements the cohesive strength at 28 days is generally less than the above figures. It is therefore necessary that when the breaking weights are stated the time needed for setting should also be given.

Rationale and Explanations.—As different cements may vary very considerably in respect to their power of uniting sand, in combination with which they are commonly employed, it is of special importance in comparing several cements that they should be tested with a large proportion of sand. For this purpose it has been found convenient to take three parts by weight of sand to one part of cement, as with three parts of sand the cohesive properties of the different cements can be exerted in a proper manner. Cement which exhibits a higher tensile strength as compared with its strength under compression permits in many cases of the use of a larger percentage of sand, and consequently commands, as it may also do on account of its greater tensile strength with a given amount of sand, a relatively higher price. The decisive test of tensile strength is that at 28 days, because when comparing different samples of cement the cohesive strength cannot be satisfactorily ascertained in a shorter time. Thus, for instance, the breaking weight of cements which differed very greatly at seven days are found to approach one another very closely at 28 days. The tensile strength at 28 days is regarded as the necessary test after delivery of the cement. If, however, it is desired to obtain a test in seven days, this can be done by means of a preliminary test when the proportion extant between the tensile strength at seven days and that at 28 days for the cement in question has been ascertained. This preliminary trial can also be conducted with neat cement when the proportional strength of the neat cement to that mixed with sand after 28 days has been established. It is of advantage in all cases, wherever practicable, to extend the tests with the specially prepared cement samples over a longer period of time (than 28 days) in order to learn the behaviour of various cements with a greater interval for induration. Sand with grains of equal size and of the same quality must be employed to insure uniformity in the results. This "normal sand" is obtained by taking the purest possible quartz sand, drying it, passing it through a sieve of 60 meshes per square centimètre (387 meshes per square inch) to remove the coarse particles, and separating from it the fine particles, which go through a sieve of 120 meshes per square centimètre (774 meshes per inch). The respective wires to be 0·38 millimètre and 0·32 millimètre in diameter. As all quartz sands do not give similar results when used in the same way, it is necessary to ascertain whether the sample of sand employed corresponds in its results with the normal sand furnished for testing purposes by the officials of the German Cement Manufacturers' Association, which sand is also used at the Royal testing station at Charlottenburg in Berlin.

Description of the Tests to Ascertain the Tensile and Compressive Strength.—As it is essential that uniform results should be obtained in testing the same cement in different localities, it is of the utmost importance that the following rules should be very minutely attended to. To attain correct average figures, at least ten sample blocks must be prepared for each experiment.

Preparation of the Cement-with-Sand Tests: for Tensile Strain.—The sample blocks may either be prepared by hand or by means of a mechanical contrivance.

(*a*) *Preparation by Hand.*—Five moulds, rinsed out with water, are placed upon five pieces of blotting-paper soaked in water, and laid upon the metal plate or glass slab used for making up the tests. 250 grams of Portland cement and 750 grams of dry normal sand are then weighed out, and well mixed dry in a hand-bowl. 100 cubic centimètres = 100 grams of pure soft water are next added, and the compound is vigorously worked up and incorporated for five minutes. With the mortar thus prepared the five moulds are filled at a single operation, and each is pressed so full that the cement stands up in a well rounded mass above the top level of the mould. By means of an iron spatula, from 5 to 8 centimètres wide and 35 centimètres in length, weighing about 250 grams, the heaped up cement is then beaten down, beginning with light taps directed rather sideways and gradually increasing in strength until the mortar is driven into the mould, becomes elastic, and shows water at the top. It is absolutely essential that each mould should receive a series of blows, carried to this point and lasting about one minute. (A subsequent addition of mortar with an extra beating-down process is not permissible, because it is requisite that the test samples made up from the same cement at various testing stations should be of equal density.) Any superfluous cement rising above the surface of the mould may finally be scraped off with a knife, and the surface may be smoothened with the same. The mould is carefully removed, and the test block is placed in a box lined with zinc and furnished with a cover to guard against unequal evaporation from the tests, caused by variations of temperature. In 24 hours after being made up the test blocks may be put in water, and it is necessary

to see that they remain under water during the whole period of induration.

(*b.*) *Preparation by Mechanical Means.*—After the mould furnished with a filling-box has been placed upon the bed-plate and fastened down by means of the two thumb-screws, 180 grams of the mortar prepared as set forth in *a* are introduced into it for each test, and the iron moulding-core is dropped into its place. By means of the beating apparatus devised by Dr. Böhme, 150 blows of a hammer weighing two kilograms are next delivered upon the core. The filling-box and the core are then removed, the surface of the test block is scraped level and smoothed over. The moulds and tests are detached from the bed-plate and dealt with as in the case of *a*. If the above instructions are accurately complied with, hand work and mechanical preparation furnish fairly uniform results. In any disputed case, however, mechanical preparation must be resorted to.

Tests for Compression.—In order to obtain uniform results at different testing stations when testing for compression, it is necessary to employ mechanical means for the preparation of tests. 400 grams of cement and 1,200 grams of dry normal sand are stirred together dry in a hand-bowl; 160 cubic centimètres = 160 grams of water are then added, and the whole are stirred together and thoroughly incorporated for five minutes; 860 grams of this mixture are then introduced into the filling-box of the cubical mould, which has been duly attached by screws to the bed-plate. The iron core is placed in position, and on it are delivered 150 blows by means of the beating apparatus of Dr. Böhme, with a two-kilogram hammer. After the filling-box and core have been removed, the test-block is scraped level and smoothed, detached along with the mould from the bed-plate and dealt with as described in *a*.

Preparation of the Tests Made from Neat Cement.—The moulds must be oiled slightly on the inner edges and placed upon a metal or glass plate (without blotting-paper under them). Weigh out 1,000 grams of cement, add 200 grams = 200 cubic centimètres of water, and thoroughly incorporate the mixture (best done with a pestle and mortar) for five minutes; fill up the moulds, rounding off the upper surface well above the edges, and proceed as in the case of *a*—the moulds, however, must not be detached from the test-blocks until the cement is sufficiently set. As the aim, in beating the cement into the mould, is to obtain test-blocks of equal solidity, the volume of water employed with very finely-ground or with quick-setting cements is to be proportionately increased. The quantity of water used must always be indicated in stating the breaking weight.

Treatment of the Test Blocks During the Testing Process.—All tests must be made directly the blocks are taken out of the water. As the period while exposed to stress has an influence upon the results, during the time the tension is being applied, the increase of load must amount to 100 grams per second (13·2lb. per minute). The mean of ten tests for tension shall be deemed the actual tensile strength. In testing for compression, in order to obtain uniform results, the pressure must always be applied on two opposite sides of the cube, not upon the base on which it was moulded and the wrought upper surface. The mean of ten tests shall be taken as the definite strength under compression.

THE SOCIETY OF ARCHITECTS.

THE opening meeting of the fourth session of the Society of Architects was held on Tuesday evening in the Society's new rooms, St. James's Hall, Piccadilly, S.W. The President, Mr. JOSEPH J. LISH, of Newcastle-on-Tyne, occupied the chair. Mr. E. CLERK ALLAM moved: "That a new rule to be numbered as the first be adopted—viz., that this society be known as 'The Society of Architects.'" Mr. FREDERICK BANKS seconded the motion, which was carried unanimously. The following gentlemen were elected as members:—William Henry Crease, 2, Back-street, Taunton; James Farrar, 29, Northgate, Halifax; Louis Jackson, 14, Dives-road, S.W.; John Varley, Skipton; George Malam Wilson, Bideford; and Henry John Wright, 4, Museum-street, Ipswich. As associates—Rev. James Hyslop, 23, Normanton-terrace, Derby, and William Jackson, 199, Mansfield-road, Nottingham. Forty nominations for membership were read.

The PRESIDENT said he regretted to announce that since their last meeting they had lost three members by death—Mr. John Moir, 55, St. Michael-street, Dumfries; Mr. Arthur Hasland, A.R.I.B.A., Percy Chambers, Charlotte-street, W., lecturer on architecture at the Polytechnic Institute; and Mr. Luis Antonio Coyne, Edinburgh—and he proposed that letters of condolence be sent to the representatives of these gentlemen. This was seconded by Mr. R. CRUWYS, and agreed to. On the motion of the President, seconded by Mr. T. R. RICHARDS, votes of thanks were awarded to Mr. W. H. Seth-Smith, senior vice-president, for his gift of a handsomely carved oak chair for the President; and to Mr. C. Stanley Peach for his services as honorary architect for the alterations to, and furnishing of, the hall, special mention being made by the President of Mr. Peach's excellent designs for the wrought-iron gas-fittings.

Mr. EDGAR FARMAN, hon. sec, announced that Mr. G. Benson, secretary of the York Architectural Association, has presented a copy of his work on "Picturesque York" to their library; this was acknowledged with thanks. On the motion of the PRESIDENT, the balance-sheet for the past year was received and adopted.

The President then delivered his

INAUGURAL ADDRESS.

In his introductory remarks, Mr. Lish congratulated the members on the healthy condition of their membership roll. Since last session 48 members had been added to the list, and in addition 40 nominations were in hand. During the past session papers had been read by Messrs. Seth-Smith and Robert Walker, of Cork, on "The Proposed Statutory Registration of Architects," both well reasoned, thoughtful, and valuable contributions to the subject; Mr. Appleton read a paper on "Sanitary Notes"; Mr. Basil Champneys one on "Architectural Styles, Old and New"; Mr. W. Allport one on "Housing the London Poor"; Mr. C. H. Searle one on "Quantity Taking," to be followed during the coming session by a second paper on "Specifications"; Mr. G. H. Robertson one on "The Law as Affecting Architects"; Mr. Ernest Farman one on "The Law of Party Walls and Easements"; while Mr. Ellis Marsland contributed a most useful paper on "Architects and the Metro. Building Act." He thought they could not have too many papers of this practical kind. The president also referred to the conference in May last on the proposed Registration Bill and to the recent visit to York, adding that the programme for the present session would include, besides Mr. Searle's paper previously referred to, a paper by Mr. Walter Emden, on "The Prevention of Fires in Theatres"; one by Mr. J. Leaning on "The Relation of Architect, Surveyor, and Builder"; one by Mr. Edgar Farman on "The Architect as an Arbitrator"; and others by Mr. H. R. Gough, their ex-president; Messrs. Seth-Smith, J. Starkie Gardner, and G. A. T. Middleton. Having referred to Lord Randolph Churchill's recent utterances anent science and art at Newcastle, the president suggested that perhaps architects would do well to consider each for himself whether there were not some substratum of truth beneath Lord Randolph's strictures, and endeavour to bestow more attention on the scientific aspects of the problems before them, and on the practical work of the present day, even if this compelled them to give less time to the study of the art of the past. The president continued:—Architects are said to be "losing ground every day." How is this condition of things to be dealt with? Foreign competition has led to the methods of the foreigner being closely scanned to see in what direction he may be beaten. This has resulted in a demand for "technical education," that we may be in a position to meet him with his own weapons. This policy is of interest to us as a profession. We also have determined "competition" to deal with in our own borders—a home-grown article—which cannot be ignored. Architects complain that much of the legitimate work of the profession is passing more and more into the hands of the civil engineer, the sanitary expert, the surveyor, the builder, and "others," whom the public, in some cases, regard as having more scientific or more practical knowledge, or as having more of both. Why should not the architects set to work to qualify themselves to out-distance the engineer, the surveyor, the "expert," the builder, and the "others" in those qualifications which have gained them the preference? If a *Volunteer* beats a *Thistle*, there may be some talk of "out-sailing"; but the net result will be a re-casting of lines to beat the victor. The men preferred before us are favoured simply by reason of their supposed or asserted superior acquirements, their acquaintance with the *technique* of the trades, with the peculiarities, and with the values of building materials and appliances, with drainage, with sanitation, with problems in statics, and with the thousand and one things which the student of art has all too frequently classed with the hewing of wood and with the drawing of water; but the presumed possession of which, and the common sense and business capacity which such acquirements seem to indicate, give confidence to the client that such a one is more to be trusted with the spending of his money. The public wants its work to its own liking, and if architects are not equal to its demands they will be brushed aside, and others employed in their stead. As for the higher reaches of art, the average client is not deeply concerned. But that he should receive twenty shillings' worth of value for the pound sterling, is a matter which is never absent from his mind for long periods. Why should it be? For years past we have been rendered familiar with the homilies on education of those who would advise us as to methods of culture. But we may express a wish for a somewhat clearer understanding of what is embraced in this term "educate." With the educational standard of the Institute we, of course, are all familiar; but the students who have satisfied the requirements of its examiners are amongst those who complain of the ever-increasing encroachments of those who are supposed by them to be less competent to take the architectural fences, which seems to indicate that there is yet room for improvements in our methods of training. Professor Roger Smith, in his excellent introductory lecture to the classes in architecture at University College, says that the object of the education of the architectural student should be to fit him for practice—that is for business. Now, the business of an architect, as we know, is primarily the designing and construction of buildings. The designing section can no more be divorced from the construction, and construction from design, than the flesh can be divorced from the bone, without prejudice to the final result. The authors of those Mediæval works in this country, so cherished by the modern architect, were not designers merely, but "builders," I doubt not—though builders of a masterly type. There are modern architects who are fast resolving themselves into mere picture-liners—though masters at that. They can bespatter double-elephant with architectural "grace-notes," without limit; but others are preferred before them—others less worthy than they. Such is the burden of their plaintive symphonies. The late Mr. Whichcord, when President of the Institute, made a strong appeal in favour of greater attention being given to the more practical side of the profession of architecture, and I am inclined to think that his remarks are as appropriate and as necessary to-day as they were in 1880. The thorough-going exponent of the graphic, as distinguished from the practical department of the profession, places himself in the hands of Providence and of the quantity surveyor, and if these fail to supply him with the necessary data, "the practical suitability of his buildings for their purposes, the provision for best schemes of ventilation, of drainage, and other matters of sanitation or of convenience, of the first importance, are very much left to take care of

themselves." The "art architect," as he has come to be designated—though why it should be less of an impertinence to pose as an "art" architect than as a "superior" surveyor, I leave for those learned in such matters to determine—the art architect, I say, has his headquarters in London. He is occasionally to be met with in other large centres; but it is the exception to find the provincial practitioner cultivating that "lean and hungry look," resulting from an exclusive consumption of the sauces, the spices, and the condiments which constitute the commissariat of his brother who exalts art and despises business. It is some satisfaction to think that it would be difficult for him to secure an enduring foothold under such an examination as that of one of our Metropolitan societies, which includes some tests of practical acquirements, and, as far as it goes, is an honest attempt to wipe out the reproach which attaches to merely artistic attainments. The aim and the ambition of every architect is to have works—not to depict—but *to build*. Yet there are amongst us those who profess to despise any acquaintance with practical matters, though some knowledge of such subjects might be of value to those whose purpose it is to build. Ours is a profession, and the only one, in which men can be found who are ashamed to know their business. The pupil-apprentices of our large engineering establishments, such as the Stephensons, the Hawthorns, the Neilsons, the Kitsons, and Sharp, Stewart, and Co. are trained not only at the drawing-board, but are required to take their share of the work "in the shops." They are set to pattern-making, to moulding and casting, to the work of the coppersmith, to forging, and to boiler-building. They work at the lathe, and in the erecting shops, take part in constructing the engine or the machine in its complete form. This class of training has produced engineers who are in request in every quarter of the globe. If you were to question such being "practical" men, they would think you had taken leave of your senses. Should you venture to suggest to the "art architect" that he might be a practical man, he would look upon you as a fit subject for an asylum. But while the engineers referred to can hold their own against all the world, the art architect is being pressed out of the field; often by men much inferior in artistic ability and education. The one is a thoroughly trained, "all-round" man, the other is, on one side, a finger-post pointing to art. Turn him round, and he points to nowhere. An architect, whilst being well grounded in questions of art, should be so much of an engineer as to be able to calculate the capability of every piece of material he puts into a building. This may be denominated hum-drum, and inimical to fine conception. Such a practice regularly indulged in, however, would eliminate much of the crudity from first thoughts, and save much after heart-searching. Most architects, at one time or another, will have felt the need for and value of such a qualification, or have regretted its non-possession. From "many a faut it wad free us," and from many disappointments to boot. Indeed, in the matter of education, it would be safe to say that the architect would not be the worse for knowing something of most things lying "between the lower chalk and the moon"; unless, forsooth, this piling up of the knowledge should cause life to become what an electrician would describe as "short-circuited." Some architects have acquired much of their knowledge of materials and of trade processes by acting as clerks of works prior to commencing practice, and this is a course presenting many advantages to the young architect. Perhaps as much cannot always be said of the advantages to the building he supervises. Some time spent in the foundry, and in the pattern-making department of an ironworks, and a little time at the anvil, under such an instructor as the late Alfred Newman, would give such a "grip" of the subject that one would for ever after design ironwork, both cast and wrought, with a power that could be secured by no other means. Then, again, some time might profitably be occupied in the yard and workshops of the timber merchant. Then the "laboratory" of the profession—the office of the quantity surveyor—should not fail to be mentioned. Here the budding architect will be able to range all his information into line, and test his acquirements by getting at close quarters with the facts. The gentlemen who take out the quantities for our buildings must, as we are aware, know what next and next of every stroke of the pick and of the chisel; how and by what stages the work is dressed and is set; must be familiar with the whole range of details and with every class of construction; must be expert at calculating loads and strains; must be as much at home with the work of the artisan as the workman himself; and, in the matter of figures, must be able to pass muster as newly wound-up calculating machines. Indeed, there is not a solitary piece of information about structural work or about materials and methods but can be pressed into service in this department of practice. Here, then, is a field for those staggering under the weight of "genius." The knowledge of synthesis possessed by our architectural chemist must be as profound and as far-reaching as his power to analyse. Have we not heard it whispered that quantity surveyors have had drawings placed in their hands in which it was difficult to discover more than what a chemist would call "a trace" of constructional detail to guide them in their work. How necessary, then, to this surveyor is the power to construct as well as the power to dissect. Extended knowledge in this, as in other fields, would, moreover, develop a modesty for which, I am afraid, our profession is not over proverbial, and make the architect into a scientific constructor in the best sense of the term. Further, as to expenditure, you will not fail to know whether the question "What will it cost?" is the first or is the second; it will certainly not be the last word of the client. I know that there are numerous architects who have a wide, and a deep, acquaintance with various branches of scienee and with practical matters. My contention is that our profession would benefit by a more general diffusion of a knowledge of science and of trade processes amongst us—an acquaintance with which would benefit every practitioner, and would not be without its advantages to his clients. There are in the profession, unfortunately, those whose word can rarely be quite relied upon when that word has reference to estimating. If, in dealing with such, the estimates should come in at £50,000 instead £25,000, is it to be wondered at if the client should say, in his wrath, "All men are liars." With the bringing about of much reckless and unreliable estimating, the system of competitions has had much to do, but the time for ridding us of this anomaly is not yet. Everyone who aspires to the title of architect should—and it ought to go without saying—know so much of values as to estimate within a reasonable amount of the cost of any work he may be called upon to carry out. It would be a singular professional life, however, which could be spent without its record of blundering in costs, and in other matters. But this question of exceeding of estimates is such an exceeding reproach to our profession, and is working such an infinitude of mischief, that one could wish to see every individual practitioner resolve to have utterly done with the cankerworm, so far as he is concerned. Of course, all this is very much removed from mere "art," though very closely allied to "building"; but as all the circumlocution and red tape of the drawing board and the T-square are merely preliminaries to the ultimate building—the power to build well, and with economy, should surely not be inferior to the power to delineate effectively. We are engaged in the art and *practice* of architecture, be it remembered, and whether our rendering of art be surprisingly beautiful or as ugly as sin, the more we know of trade processes, of materials, and of prices, the more satisfactorily shall we be able to acquit ourselves of the claims made upon us by the client. Respecting the movement for the formation of a provident fund for architects' assistants, for those who are in the stage preliminary to practice, if it should be determined to establish such a fund, I hope its scope will be widened, so as to embrace engineers' and surveyors' assistants within its benefits. I think I shall be expressing the sense of the members when I say that the Society of Architects will give its countenance to any movement of this kind. Self-help, however, is the best help, and if the assistants really desire to establish a provident fund, they should give evidence of their wishes in that direction by attending the meeting to be held on Friday night, for which purpose this room has been granted. As a society taking a special interest in the question of registration, the Bill for that object, with the various suggestions for its improvement embodied therein, is about ready for presentation to Parliament. The labours of the Registration Bill Committee have not been carried on without cost—considerable cost—as you can readily conceive. Such expenditure has hitherto been met by the committee out of their own pockets, coupled with some monetary assistance from the Society of Architects—the society contributing the sum of £45 towards the expenses. Now, however, that it is proposed to bring the measure before Parliament, funds will be required for this purpose. It ought hardly be necessary to say that having induced a committee to undertake the burden of the work of drafting the Bill, the professions interested should now undertake the burden of the cost to be incurred in passing the Bill into an Act. With a view to bring this subject practically before the country, it has been suggested, amongst other measures, that treasurers be appointed in all important centres, with powers to receive subscriptions in furtherance of the Bill. I need not go into the details of the draft Bill. Reference, however, has been made to builders and to their designing of houses. After a Registration Act has come into force, builders and other practical men will still continue to design, as well as build, domestic works—and many of them, we know, are well qualified to do so—but what the Act is expected to secure, so far as architects are concerned, is, that those persons desiring to practise as architects shall give evidence of an intimate acquaintance with the materials and with the *technique* of the several trades concerned with building, and we may presume that ultimately candidates will have to show something approaching as sound and as wide a knowledge of building as the builder himself, and that they shall, superadded to this, be expected to have such information on scientific and on sanitary matters, such a knowledge of building law, and such an acquaintance with art, as no builder can be looked to to possess. Some fear that compulsory examinations will be a bar to men of genius entering the profession. But it is surely not of less moment in this work-a-day world that we should be qualified all round to build soundly and well, than to build with a view to the picturesque. I have no fear that an examination of a thoroughly practical kind will stamp out, or even damp down, the more artistic instincts; but will rather be a help to the student to distinguish himself in the higher reaches of the profession, whilst giving him a command of such a fund of scientific and technical knowledge as will insure truth, as well as point to his pencil. Under the existing *regime*, when a youth enters the office of an architect, if he should have an irrepressible love of hard work bubbling up in him, he may find his architectural acquirements at the termination of his articles more advanced than at the outset; but there is no compulsory examination looming up before him to demand application and enforce study, and no one standard of acquirements agreed upon and made equally binding upon all our students. This lack of one fixed standard for all students will account for much of that unequal culture which now marks the profession; a condition of things which would quickly be altered for the better if the passing of a standard examination was rendered compulsory over the whole kingdom before practice could be entered upon. This, I take it, is even of more importance to the public than to architects. Independent of the church, the law, and medicine, several cases will occur to you in which examinations are applied as a test of fitness for practice or business. This is the case now with colliery managers. Accountants have their compulsory examinations. The analytical chemists and the apothecaries also have their examinational qualifications. The plumbers are registering and proposing a code of tests of fitness for the following of their craft, and I cannot bring myself to think, gentlemen, that an architect will rank as less than the least of one of these.

Mr. Robert Walker, of Cork, proposed a vote of thanks to the President for his interesting and practical, though somewhat discursive, address. He thought Mr. Lish had been a little

too severe upon the art-architect, for although gentlemen who professed to regard art almost to the exclusion of construction, and who were not fettered by exigencies of cost, were to be found among the last generation of architects, the race appeared to be nearly extinct now.

Mr. HERBERT GRIBBLE, A.R.I.B.A., speaking as a member of the Institute and of the Registration Committee, wished the Society of Architects a flourishing future and all success in its useful work. Some anxiety had been expressed as to the principles which would guide the committee in registering the professions, but he believed they would be found to be just, and neither too severe nor too lenient to candidates for admission. He begged to second the vote of thanks to the President for his excellent address.

The motion was supported by Mr. SETH-SMITH, who remarked that he should have preferred to have seen the Registration Bill promoted by the Institute; but as they did not seem inclined to move in the matter, the committee felt there was no alternative but to proceed. The Bill had been so drafted that its operation would be in the hands of the Institute if they chose to act, and the public would, he believed, receive the proposal favourably, as no attempt was made to increase the professional scale of fees.

In reply to the vote of thanks, which was carried by acclamation, the PRESIDENT said he believed the public would not suffer architects to practise much longer without demanding from them some qualification as to fitness to exercise their profession, and this would be gained by the Registration Bill. It was of small moment what body was to give the Bill legislative force; the main principle was to insure a general examination for all practising as architects.

BUCHAN'S IMPROVEMENTS IN VENTILATING CHURCHES, HALLS, AND SCHOOLS, &c.

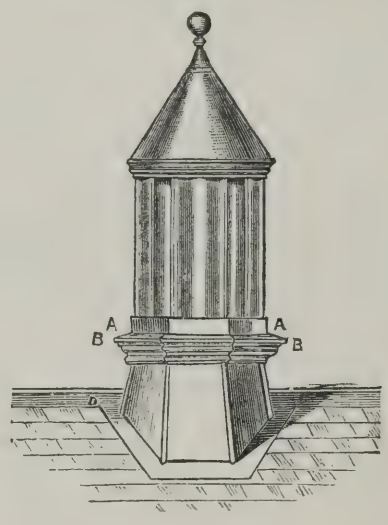
IN our columns on August 21st, 1885, and August 6th, 1886, we referred to the improvements in ventilation introduced by Mr. W. P. Buchan, sanitary and ventilating engineer, of 21, Renfrew-street, Glasgow. To-day we call attention to what he has done in providing a simple "formula or data for calculating the size of the main outlet pipes and ventilators."

As to this Mr. Buchan says:—

"As the sites and sizes of buildings are so various it is difficult to publish a working rule suitable for all cases, more especially when *monetary circumstances* form a factor in judging. A building, such as a church or school, &c., freely exposed to the wind all round, and especially if on raised ground, will be well ventilated with about half the provision for outlet ventilation that would be required for a similar building if in a sheltered position, and with high buildings near or round it.

"Upon this understanding it may be stated that for the outlet ventilation of churches, chapels, and halls, seated for, say, from about 300 persons upwards, the rule may be to allow from half a square inch up to a square inch and a half of outlet for each person. The medium being one square inch of outlet for each sitter. Another basis of calculation may be to allow from ¼in. to 1½ square or superficial inches of outlet for each 120 cubic feet of space. It is generally better to have two, three, four, or more outlets in the ceiling than only one, and especially for low and flat ceilings. A regulating valve is used to stop ventilation when heating up, &c.

"Allowing the half square inch of outlet for each seat for a church seated for 800 means either one 24in. diameter main outlet pipe with one of my 42in. ventilators, or two 17in. diameter pipes with two 30in. ventilators. One square inch of outlet area, again, for each of the 800 would need either a 34in. diameter main outlet pipe with 54in. ventilator, or else two 24in. diameter pipes with ventilators to suit. Of course, a half-filled church can do, *pro tem.*, with less than a well-filled one, but when the church or hall is full, and too little ventilation provided, complaints are sure to be made, especially in warm and close weather.



"The cubic capacity of some churches seated for about 800 is about 100,000 cubic feet, giving 125 cubic feet for each of the 800. In others the allowance is more or less, as the case may be.

"In practice I have supplied three 30in. ventilators, each with 17in. diameter, outlet pipe (and self-acting valve boxes), for a well-exposed church, seated for about 900, being nearly ¾in. of outlet to each. In another case only two that size for 850, while in one case for an old church, seated for about 1,000, only one 17in. diameter outlet pipe was ordered! If, in this latter case, *the attendance* was only 200 or 300, then the one 17in. outlet with 30in. ventilator might do for a time, under such circumstances.

"For some small country churches, seated for fully 400, one 33in. ventilator with 20in. diameter main outlet pipe does very well, or two 24in. or 27in. ventilators with 14 to 16in. diameter outlets. When well-exposed and seated for 250, a 30in. or 27in. ventilator with 18 or 16in. diameter outlet may do; but all the better the larger.

"Churches, &c., open to the ridge require no piping, unless where, as often done of late, my self-acting valve boxes are used, when a short piece of pipe about 2 or 3ft. long is needed between the top of the open-roof valve-box inside and the ventilator outside.

"For schools (and, to some extent, for small churches or halls holding less than 300) the allowance for outlet ventilation should be much greater per head than above, as schools are occupied for a longer time, and daily, and

by young growing people; hence, from 2½ to 4 square inches of outlet for each pupil is needed, and provision ought to be specially made to prevent down-draughts upon the heads and bodies of the children. It is a crime to keep children sitting chilled and shivering below ventilators that allow oft-repeated or prolonged down-draughts. There is great room for improvement throughout the kingdom in regard to this. The pretended ventilation, again, sometimes provided by means of holes in the ceiling and outer roof, opening directly into the garret or space between the outer roof and the ceiling, is generally a sham and also a great nuisance owing to down-draughts. Police and law courts might rank like schools.

"When a church or a school, &c., is well ventilated (and asphalted) below the ground floor, less direct fresh-air inlets are necessary.

"Hospitals require extra good ventilation, and, according to Dr. Parkes, an allowance of from 1,500 to 2,000 cubic feet of space for each patient, fully 12 to 16 times as much as in second paragraph above, so in same proportion that means from 6 to 18 square inches of automatic outlet ventilation for each patient; but Dr. Parkes seems to wish nearer 60in. for each, in addition to window ventilation. This 1,500 cubic feet of space for each, in the case of 20 patients, would need a ward, say, 80ft. by 26ft. by 14½ft. And 60 square inches of special outlet for each means either four 20in. diameter outlet pipes, or two 28in. with exhaust ventilators to suit. If, however, ample outlet ventilation sooner made the patients well, it would soon pay itself. Special provision ought to be made to protect the patients from down-draughts and chills.

"For rooms in houses, &c., allow about 10 square inches of outlet area for the room, and then from 2 to 4 square inches more for each person in it. I have never seen too much outlet ventilation provided for either church, hall, school, or room, &c., although often too little."

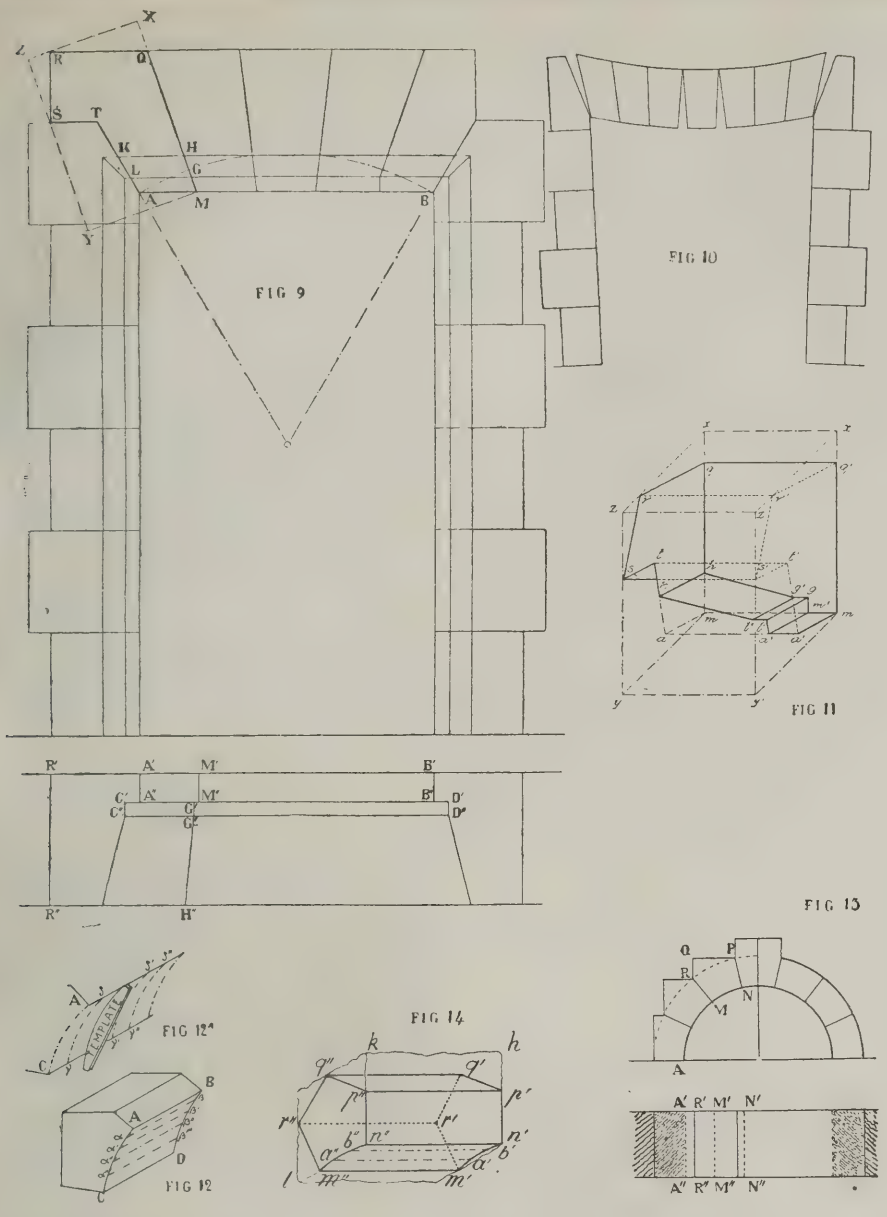
In reference to the question of showing exhaust ventilators set up above the ridge of a building, Mr. Buchan says truly that seeing it is admitted ventilation is necessary:—"Ventilators have, therefore, as legitimate a right to be seen on buildings as chimneys, and should be freely exposed to their motive power, the wind. Architects should assist in making them presentable without marring their efficiency."

The illustration here given shows an attempt to do this with a plain No. 2 (octagonal-base A A) ventilator for a church at Bearsden, near Glasgow, the architect designing and providing the seat B B. In this case two ventilators were placed on the church, as shown, and the architect writes:—"They improve the appearance of the roof by breaking the long outline of the ridge."

In connection with the ventilators, Mr. Buchan's Self-acting Anti-down-draught and Inspection Valve-Boxes have been fitted up in the garret above the ceiling. We understand that a large number of these valve-boxes have been used for schools, halls, and other buildings, as well as for churches, since our recommendation of them in the BUILDING NEWS of 6th August, 1886.

MASONRY AND STONE-CUTTING.*

By LAWRENCE HARVEY.†



SECOND LESSON.—FLAT ARCHES.

IN our example (Fig. 9) we show the interior elevation of a square-headed doorway. The faces A′ A″ and B′ B″ shown on plan are the outside *reveals* of the doorway; the narrow fillets C′ C″ and D′ D″ are the *rebates* to lodge the thickness of the door; the distances C′ A″ and D′ B″ which separate the rebate from the reveal are its depth; the *splayed* sides towards the interior of the wall allow the door to be more conveniently opened than if they were straight. The uppermost stone of the door jamb rests on the wall and forms the abutment of the arch. The voussoir next to this is the *springer*. In our opinion, for a square-headed door formed of stone voussoirs the thickness or vertical dimension of the head or lintel should be equal to, at least, ⅔ of the width of the doorwary, for only a part of the joint of each voussoir receives a solid abutment from the wall; that is, the part of each joint which is above an arc of a circle drawn from the centre where the joints of the voussoirs converge. The ends of the voussoirs below this arc are really only a load, and not a help, to the safety of the archway. The centre of convergence for the joints of the voussoirs is usually the apex of an equilateral triangle formed on the opening A B.

In Fig. 10 we have shown how a flat arch is destroyed; the joints gape at the bottom part of the keystone and at the upper part of the springer, so that the first voussoir turns round its lower arris next to the springing line. To prevent this, the first voussoir is often made with an elbow, as shown on the left hand of Fig. 9; the weight of the wall above the elbow helping to keep this voussoir firm, so that it partly belongs to the jamb of the archway. On the right-hand side of Fig. 9 we show how the lower part of the joints of the voussoirs are sometimes cut so as to be perpendicular to the soffit of the arch; but, as we have said before, such devices are nearly as objectionable

* All rights reserved.

† As many readers know, this subject, of which there is no English textbook in existence—is now in a fair way to receive the attention it deserves. The City Guilds Institute is taking the matter up, and the Institute of British Architects will probably move one of these days in the same direction. A series of classes for the use of architectural students to enable them to obtain, by the means of masonry, a thorough knowledge of the geometrical operations which find constant application both in architectural drawing and construction, is now being held at the City Guilds Institute, South Kensington, on Monday evenings, from 7.30 to 10, commencing on Monday, October 17th, 1887. The series is divided into three courses of ten lessons each. We have availed ourselves of Mr. Harvey's assistance to place the notes and diagrams of these lectures before our readers, convinced that they cannot fail to benefit students generally.—ED. B.N.]

as the acute angles they are made to correct. In our opinion, the best arrangement is to make the joints of the voussoirs simple planes, and just ease them at their lower part by rubbing, so that from the dotted arc downwards they come not into close contact. At all events, broken bed-joints must never be used for the keystone, for this should be made rather longer than required, and rammed in as tight as possible. The cutting of the keystone at the back should be done on the work after the stone is in its place, which will be found very easy to execute. As to the use of elbows, we think it is more a question of taste than of construction; if used, they must be worked with the greatest care and bedded in cement, so as to prevent any danger of unequal pressure in settling.

We shall now cut the voussoir A M Q R S T (Fig. 9). The stone from which it will have to be cut must be as long as the thickness R′ R″ of the wall (see plan), and its end face must be at least equal to the dotted line X Z Y M (see elevation), which comprises the elevation of the voussoir. We give that stone in perspective (Fig. 11).

Let $x\,m\,m'\,x'$ be its natural bed in the quarry; we work that surface to a true plane and delineate thereon the face of the joint M Q (Fig. 9), this is the polygonal figure $q\,q'\,m'\,m''\,g'\,g''\,h\,q$ (Fig. 11), which we get by making $q\,h$ = Q H, $q\,q'$ = R′ R″, $q'\,m'$ = Q M, $m'\,m''$ = M′ M″, $m''\,g'$ = M G, $g'\,g''$ = G′ G″. Then, with the help of a square, we work the two end planes $x\,m\,y\,z$ and $x'\,m'\,y'\,z'$ of the stone, and draw on both of them the outline of the stone in elevation; these outlines are (Fig. 11) $a\,m\,q\,r\,s\,t$ and $a'\,m'\,q'\,r'\,s'\,t'$. We can now work the lower bed joint $a\,t\,t'\,a'$ of the voussoir, thanks to the directing lines $a\,t$ and $a'\,t'$, across which we can lay our straight-edge. We shall cut in the same way the sides $s\,t\,t'\,s'$, $s\,r\,r'\,s'$, $r\,q\,q'\,r'$.

As to the soffit of the voussoir, we might begin by working the whole of the surface $a\,m\,m'\,a'$, and then from that pass on to the rebate and the splay. But this would involve a waste of labour, as part of the surfaoe $a\,m\,m'\,a'$ will have to be removed, To avoid this, on the plane of the lower joint $a\,t\,t'\,a'$ we delineate $t\,t'\,a'\,a''\,l'\,l''\,k\,t$, the real outline of that face by making $a'\,a''$ = A′ A″, $a''\,l'$ = A L, $l'\,l''$ = G′ G″; and then we have all the directing lines $a'\,a''$ and $m'\,m''$, $a''\,l'$ and $m''\,g'$, $l'\,l''$ and $g'\,g''$, $l''\,k$ and $g'\,h$ required for working the planes which form the soffit of the voussoir.

WORKING CYLINDRICAL SURFACES.

To work cylindrical surfaces, such as the soffit of the voussoirs in an archway, two methods can be used.

In the first method (Fig. 12) the curved arris at each end of the voussoir is delineated by the help of a head mould taken from the elevation of the arch. The two curves, A α, $a'\,a''$; B β, $\beta'\,\beta''$ are then used as guiding lines, and the cylindrical surface can be then worked with the help of a straight-edge as easily as a plane. The stone is knocked off between the curves, so that a straight-edge laid along parallel lines, such as A B $\alpha\,\beta$, $a'\,\beta'$, $a''\,\beta''$, &c., shall coincide in every part with the surface of the stone.

In the second method (Fig. 12A) a templet is used cut to the shape of the arch. The upper arris, A B, and the lower arris, C D, of the stone beds are used as directing lines; the stone is worked so that the templet placed in any position, $\gamma\,\delta$, $\gamma'\,\delta'$, $\gamma'\,\delta''$, &c., perpendicular to the directing lines, shall coincide in every part with the surface of the stone. This second method of working a cylindrical surface has to be used where the ends of voussoirs are not normal to the soffit, but are either skew planes or other surfaces such as cylinders and spheres.

RIGHT SEMICIRCULAR ARCHWAY.

As the simplest example of cutting cylindrical surfaces, we shall take a semicircular archway. Such a archway of free stone in a brick or rubble wall is sometimes finished by a circular extrados concentric with its soffit as in Fig. 13, right hand side; but more often the stones are finished by a horizontal surface P Q and a vertical joint Q R, as on the left-hand side of Fig. 13. It is such a voussoir M N P Q R (see elevation, Fig. 13) we intend to cut.

Firstly, we must select from the quarry a block of stone (Fig. 14) forming a prism, the length of which will be more than equal to the thickness A′ A″ of the wall, and the base $k\,n''\,l\,i$ of which will contain the vertical elevation of the voussoir; but it is not necessary that the head of the stone should be a rectangle. We begin the work by forming the plane $k\,n''\,l\,s$ and we draw thereon the head $m''\,n''\,p''\,q''\,r''$ of the voussoir, taking care that the side $n''\,p''$ coincide with the bed of the stone, as this side is one of the bed joints of the voussoir. As all the voussoirs are identical in shape from the dotted extrados to the soffit, it will be better to use a mould in cardboard cut out to the shape R M N P, and then the workman will only have to draw on the stone the lines P Q and R Q.

Now, we shall work by the help of a square the surfaces of the bed joints, that is the surfaces $k\,h\,n'\,n''$ and $r''\,r'\,m'\,m''$. Then on the surfaces we draw the outlines of the bed joints of the voussoir, such as $p''\,p'\,n'\,n''$, and using the arrises $p'\,n'$ and $r'\,m'$ as guiding lines we work the other end of the stone to a plane. We draw again on this last plane $m'\,n'\,p'\,q'\,r$, the outline of the head of the voussoir, and then complete the two remaining planes $p''\,q''\,q'\,p'$, and $q''\,r''\,v'\,q'$. The cylindrical soffit can be finished nearly as easily as a plane by the help of a straight-edge and the two guiding arcs $m''\,a''\,b''\,n''$ and $m'\,a'\,b'\,n'$ (Fig. 14).

(To be continued.)

CHIPS.

H.R.H. Princess Christian will open the new school of cookery and the girls' club-rooms, recently erected from Mr. Gough's designs, to-morrow (Saturday). Messrs. Wallace Bros., of Barnsbury, were the builders employed. The new buildings are additions to St. Clement's Schools, Leverstreet, City-road.

The old chimes in the tower of Lenham parish church were started on Friday, after remaining silent for eight or ten years. The machinery, which is a fine specimen of the ancient method of playing tunes on church bells, and which had fallen into bad repair, has been restored and repaired, and nine tunes added, as a Jubilee memorial, contributed by the inhabitants of Lenham. The whole of the work has been carried out by the well-known firm of Lund and Blockley, clock and carillon manufacturers, of Pall Mall, London. The same firm has just erected a full quarter turret clock in the parish church of Birchington, Kent, as a Jubilee memorial.

A mission building is about to be erected in the Fishmarket Close, Edinburgh, from plans by Mr. Robert Wilson, of Queen-street, in that city. It will be Scottish in style, will cost £2,700, exclusive of site, and will consist, on the ground and first floors, of classrooms and reading-room, and, on the upper floor, of a hall seated for 300 people.

The foundation-stone of the Children's Jubilee Hospital at Gateshead-on-Tyne will be laid on Friday, December 2nd. The building is being executed from designs by Mr. W. H. Dunn, of St. Nicholas' Buildings, Newcastle, selected in competition, and will be of red brick, with stone dressings and half-timbered gables. At present only the administrative block and one of the proposed four wards will be proceeded with.

The Royal Scottish Society of Arts have awarded honorary silver medals to Major H. L. Mackenzie, of Stirling, for a paper on his improved military sketching protractor, and to Mr. Wm. Bennett, governor of the city poorhouse, Edinburgh, for his description of improvements in apparatus in bundling firewood.

OUR LITHOGRAPHIC ILLUSTRATIONS.

WEST KENSINGTON CONGREGATIONAL CHURCH.

In the competition for this building, the "conditions" seemed to suggest a rather close adherence to the ordinary church-type of nave, aisles, and chancel. To lessen the practical inconvenience of this type for Congregational worship, the architects of the successful design adopted the system of wide nave-arches and few columns. The nave is thus divided into several nearly square ceiling-compartments, each of which is filled with an octagonal wooden ceiling of its own. From these ceilings, which are tied round their base by a strong curb, the outer roof is strutted up. There is a central tower at the crossing of the nave and transepts. An external view of the original design appeared in the BUILDING NEWS some years ago; but in execution the tower and some other features were considerably modified. Internally, the walls are lined with buff terracotta bricks. Outside, they are of Yorkshire parpoint, hammer-dressed to an even face, and the architectural details are of Ancaster stone; the roof is tiled. The church seats about 1,000 persons, on the ground floor, without galleries. The architects were Mr. James Cubitt and Mr. J. M. Brydon, and the clerk of works Mr. C. Osborne. The total cost was between £9,000 and £10,000.

A MENTONE VILLA.

This drawing was done to send to the Royal Academy in 1886, where it was favourably hung. The idea is such a house as would be suitable for the residence of an Englishman in the Sunny South. S. J. N.

A CHAPEL FOR THE TROPICS.

This is also an unexecuted design. The windows should be of thin slabs of stone or marble perforated in a close pattern. If doing the drawing again, I should be inclined to put deep brackets to the wide eaves. S. J. N.

HOTEL DE VILLE, COMPIEGNE.

Mr. Mitchell's drawing herewith reproduced to-day furnaces a study of a very suggestive façade. The town of Compiègne, situated about a hundred miles from Paris by rail on the Great Northern, was once more prosperous than now, when the place for generations was the fashionable residence of the French monarchs, who here obtained good sport in the forests of the neighbourhood, and enjoyed the pleasures of the chase in its very extensive park. The forest occupies an area of 30,000 acres, and is noted for its oaks. The Royal Palace at Compiègne has a grand façade overlooking the woods, with a terrace 4,800ft. long. The building is of the time of Louis XV., and was built from the designs of Gabriel. Napoleon erected a fine hall, in the form of a gallery, and the interior of the palace was elaborately furnished. The chief object of interest in the town to the architect is the Hôtel de Ville, now illustrated. Its front elevation, which measures about 71ft. wide, is surmounted by a clock and bell tower of picturesque design, and its dormers are rich in detail. This tower was a favourite with the late E. W. Godwin, who more than once adapted its general form in his designs. The church of St. André, which is of 13th-century date with Late Gothic aisles added, is worthy of a visit, and the curious marble font in St. Anne's Church is put down in the guide books as remarkable.

NORTH LEITH PARISH CHURCH.

The new hall and class-rooms in connection with North Leith parish church, which have been erected in Great Wellington-street, Ferry-road, were opened last month. The buildings which are in the Gothic style, have been erected from designs prepared by Mr. Hippolyte J. Blanc, Edinburgh. On the ground flat there is a large hall capable of accommodating 900 persons, and an infant class-room, with gallery for 180 children. On the second flat there is another hall which provides accommodation for 150 persons, and which may be divided into class-rooms by means of folding partitions. A house of three apartments is provided for the caretaker, and there are also a kitchen, vestry, lavatories, and a heating chamber, the buildings being heated on the high-pressure system. There are four exit doors, two in Great Wellington-street and two to Allan-street, and all the internal arrangements are of the most complete description. In the large hall the platform will accommodate about 100 persons. The buildings are mainly of bright red sandstone from a Dumfriesshire quarry. The cost will be about £3,000.

HOUSES ON ST. CATHERINE'S ESTATE, BROXBOURNE.

These houses are from the designs of Mr. R. T. Blomfield, M.A., architect.

WINDOW DESIGNED FOR NEWCASTLE CATHEDRAL.

The pencil drawing from which our illustration of this window is reproduced was exhibited in the late Exhibition of the Royal Academy. In the centre St. Michael is represented with the scales of ultimate justice, Satan, in company with the damned, being seen on the one hand, and the redeemed are shown on the other, while above is seated The Majesty, with angels round the Throne, as well as in the tracery of the window. Mr. E. Frampton is the author of the composition. The great east window of the church has been filled with glass by Messrs. Clayton and Bell. Last Sunday the Cathedral was opened, and in the BUILDING NEWS of last Friday will be found a general interior view of the building, showing the new fittings of the choir by Mr. R. J. Johnson, F.S.A., the architect. We also gave an exterior view of the Cathedral by T. M. Richardson, sen.

A banquet was given at Louth on Thursday evening, the 10th inst., to Alderman James Fowler, J.P., F.R.I.B.A., on his retiring from the office of mayor of that borough.

A school, which has been erected at the cost of the Mayor of Conway, from the designs of Mr. F. M. Lockwood, Chester, as an adjunct to the National Schools, and so avoid the necessity of establishing a school board for the borough, was opened on Friday.

At the last meeting of the Leeds Town Council the town clerk read a letter from Messrs. T. and C. Hawksley, consulting engineers to the corporation, referring to the fact that they had for twenty years been connected with the corporation, and desiring to present to the corporation a "loving cup" of silver, covered with gold gilt, which they forwarded. The gift was accepted with thanks.

Among the receiving orders in bankruptcy announced in Friday's *Gazette* appears the name of G. Hopkins, Henry-street and St. John's Wood, builder.

Mr. R. Phené Spiers has prepared a work on "Architectural Drawing," which will be published in a few days by Messrs. Cassell and Company. The book will be illustrated with nine coloured and fifteen plain plates.

SKETCHES OF SILVERSMITHS' WORK.

We give illustration to some sketches of art silversmiths' work, mostly made this year. The Louth Borough mace was presented to that town in honour of Her Majesty's Jubilee by Mr. James Fowler, thrice mayor of that town. It is of silver gilt, and has the Royal arms engraved on the head, and an inscription commemorative of the occasion; a neatly-designed rest for the mace is also shown. The other mace is made for the Borough of Brighton, and is silver gilt, richly enamelled, with the Brighton Corporation arms, and the Royal arms; it being also in commemoration of the Jubilee. There is on the head of it a portrait of Her Majesty. It is about 4ft. long, was designed by Mr. Somers Clarke, F.S.A., and made by Messrs. Elkington, of London. The Ascot Jubilee Cup was modelled by Mr. H. H. Armstead, R.A., and made by Messrs. Hancock, of Bond-street. It represents Tennyson's "Morte d'Arthur," the side we have shown being in illustration of the scene where Arthur is conveyed on the barge:—

"'Then,' murmured Arthur, 'place me in the barge.'
So to the barge they came. There those three queens
Put forth their hands and took the king, and wept.
But she that rose the tallest of them all,
And fairest, laid his head upon her lap;
And loosed the shattered casque, and chafed his hands,
And called him by his name, complaining loud."

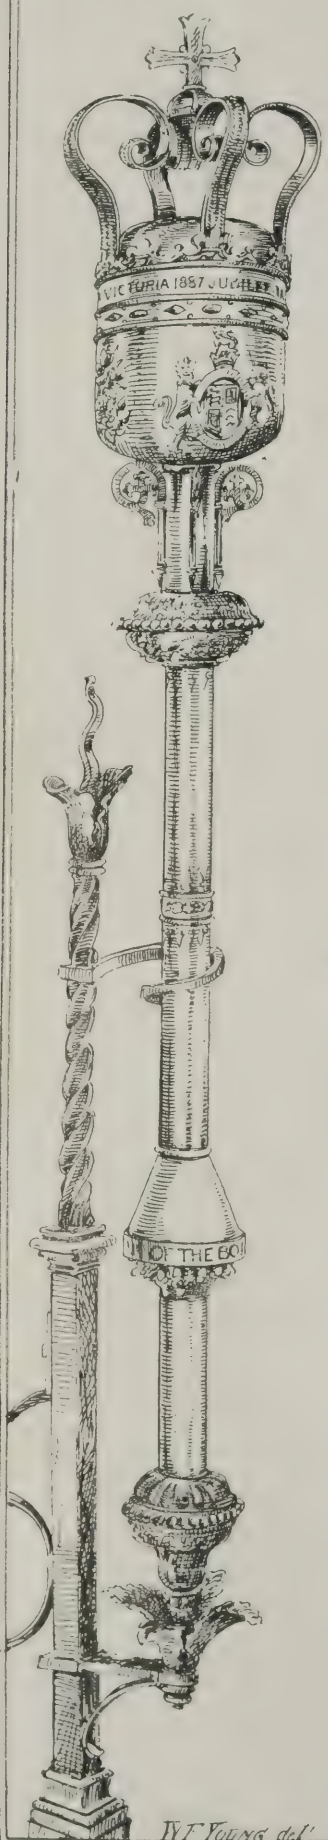
The cup at the bottom of the page was made by Messrs. Hancock some time since, having been exhibited in the Saltaire Exhibition. It represents a Bacchanalian feast and dance. It is beautifully executed, and is, we believe, at present the property of the Goldsmiths' Company.

SKETCHES OF DECORATIVE FURNITURE.

We give illustration to-day to a few articles lately designed and manufactured by Messrs. Hindley, of Oxford-street, whose exhibit at the last Architectural Association conversazione was much admired on account of its superior workmanship and good design. The Writing Table, at the head of the page, is part of a suite; it has four drawers and a bevelled mirror at back, a shaped shelf below just giving the necessary room for the feet when in use. The little Hanging Bracket is useful in a bedroom for medicine, and is made of pine, well enamelled. The China Cabinet is also of pine, enamelled white, and has shelves for china or other art objects above; and, lined with a terracotta plush, below there is a cupboard with raised panels and mouldings. The legs are carved, and the cost of this cabinet, which is nearly 7ft. high and 2ft. 9in. wide, is £12 10s., which is remarkably low, considering the good work put into it. The Renaissance Cabinet next it is of mahogany, inlaid with tulip and satin-wood; it is lined with a pale blue plush, which contrasts well with the colour of the mahogany. Messrs. Hindley have been designing some very cosy ingle-nooks, one of which we intend to illustrate in a future number.

CHIPS.

Six of the windows in the church of St. Clement, Eastcheap, E.C., one of those built by Wren, have just been fitted with stained glass from the studio of Mr. A. Taylor, of Berners-street, W., completing the series commenced by the churchwardens in 1877.



The town council of Wolverhampton have decided to raise the salary of the borough surveyor from £220 to £360 a year.

Barcelona has just provided itself with a monument of Christopher Columbus, who embarked from that port in April, 1493, after his return from the Western Hemisphere, to convey to the monarchs of the world the news of his achievement. The memorial consists of a terrace of steps facing the sea, with prow-shaped extensions at either end, and inclosed by balustrades. In the centre stands a statue of Columbus 20ft. in height. Don Cayetano Buiyas Monraba was the architect and Don Rafaelo Atché the sculptor.

Sir Michael Hicks-Beach, M.P., will open on Friday, December 2, the Redesdale Memorial Hall, which is being built in the market-place at Moreton-in-Marsh by Mr. A. B. Freeman-Mitford, C.B., at a cost of £10,000. We illustrated the building, which is being erected by Messrs. Peto Brothers, from designs by Messrs. Ernest George and Peto, in our issue of May 13th.

WAYSIDE NOTES.

WHILST many devotees of the chase were being entertained at an old "hall" in Lincolnshire, some few days back, the demon that yearly devours so many of our ancient family mansions disturbed the revelries which one may conclude attended the return of those who may have followed the horn "on a (presumably) fine hunting morn." For old Irnham Hall has had a narrow escape from total destruction by fire. Happily, as I believe, the more elderly portions of the "fabrick" were saved. Still, we cannot afford to lose even Early Tudor work. Year by year our old baronial halls crumble away, or are destroyed by restoration, so-called; our manor-houses of whatever date, are reduced to ashes; and our Jacobean, Queen Anne, and Georgian buildings are gradually swallowed up by the growth of monstre-cities and finally ruthlessly pulled down to make way for the six-roomed cottages of Mr. —— well, of a gentleman whose name the reader may, peradventure, not be wholly incapable of guessing.

The entire north wing of Irnham Hall seems to have been destroyed by the flames. Chapel, library, nursery, dining and state rooms were, we read, well alight, and burning for some three hours before a "steamer" arrived, so it is to be feared that the destruction was of a very wholesale nature. Six hours of ravaging flames at a country mansion must surely have wrought great havoc. We read that the fire had evidently been smouldering some days previously, and that it originated through an oak joist near a chimney becoming over-heated.

Helas! How very many fires have originated in this manner; in spite, too, of the M. B. of W. regulations. But it would appear that we cannot sympathise with all who suffer loss from non-fireproof and non-smokeproof flues, since the carelessness of persons is at times astonishing. Some friends recently passing along a country lane observed smoke issuing from between the roof-tiles of a cottage by the road-side, and drew the attention of the occupier to the apparently alarming phenomenon. "Oh!" quoth this worthy, "It often does that" (!)

Mem. The architect will frequently come across cases where, in effecting alterations to old buildings, he has fondly hoped to obtain a bearing for a girder or beam of some sort only to find, to his exceeding chagrin, that an old flue has upset all his calculation, as, according to his plan, the timber would run into the flue. By the ordinary method of getting over this difficulty, he would use iron shoes of one kind or another. But a better method is, perhaps, to employ a slab of York stone with a hole the size of flue cut away in it. Pinned into the brickwork this forms a corbel support, infinitely superior to cast or wrought-iron shoes.

I see that the Metropolitan Board of Works will, in a Bill to be introduced into Parliament next Session, "ask for powers to inspect theatres, dancing and music-halls, and other places of public entertainment and resorts in the Metropolis; and to provide that they shall not be licensed for their intended purpose until a certificate has been obtained from the Board respecting the efficiency of their structural and other arrangements and appliances for the safety of the public, and for protection from fire." Other clauses as to further authority and power with regard to the houses and the public safety are asked for in this Bill. Whether this measure is exactly the thing required or not, it is certainly right that someone should have more authority over theatre lessees and others to prevent their greed of gain jeopardising the life of the play-goer.

On Monday night last the President of the Surveyors' Institution delivered his opening address. It appears that after three years from the present date no surveyor can join the institution without passing the examination imposed by its charter. At the present time some 15 per cent. of the whole of the members of the institution are such by voluntary examination.

In the course of the recent opening address at the Institution of Civil Engineers, the President put a very pertinent question to the meeting, and one which is interesting to the architect. "Where," said he, "would the works of past centuries have been now had they been of iron?" Durability, though not a recognised "lamp" of architecture, is yet a quality of the first importance. But no iron construction ever yet erected has this attribute.

Mem. In discussing the great iron question, it is useful, as I think, to ever bear in mind the first aphorism in the "Seven Lamps"—viz., that "architecture proposes an effect upon the human mind, not merely a service to the human frame."

The only effect that most architects' iron skeletons would seem to propose upon our minds, is that of a possible sudden collapse, and of fickle lightness and ephemeral nature. The President of the Institution of Civil Engineers evidently felt this, even as regards engineering works pure and simple. But more than this; he alluded elsewhere, with apparent regret, to the substitution in modern times of the flat-iron girder for "the graceful and time-honoured arch." Considering that this admission comes from the head and chief of the honourable and practical body of gentlemen in Great George-street, we need not be so quick to abuse the engineer for his want of sympathy in art matters.

I had observed, Sir, the query in the Intercommunication Column *re* "Early English Foliage," and I have also noticed the reply of your two correspondents. But it would appear to me that we are really little or no wiser now upon this matter than were they at the time when the late Sir Gilbert Scott wrote his "Personal and Professional Recollections"; for, as will be remembered, Sir Gilbert, in the pages of this work, relates how he made great efforts to discover the natural form of the peculiar typical Early English foliage in question. It appears that in the year 1853 or 1854 he delivered a lecture at the Architectural Museum on this subject; and he relates how he earnestly studied botany in the hope that it would assist him to discover the member of the vegetable kingdom that inspired the 13th-century carvers.

So fervently, indeed, did Sir Gilbert follow this "will-o'-the-wisp," that the subject troubled him in his dreams. "I remember," he says, "longing most earnestly to discover a leaf, from which one might suppose our Early English foliage to have been derived. The nearest I could find was an almost microscopic wall-fern, and certain varieties of the common parsley. One night I dreamed that I found the veritable plant. I can see it even now. It was a sere and yellow leaf, but with all the beauty of form which graces the capitals at Lincoln and at Lichfield. I was maddened with excitement and pleasure; but, while I was exulting and ready to exclaim 'Eureka! Eureka!' I awoke, and behold it was a dream."

For my part, I would humbly suggest that the living prototype of the peculiar foliage referred to cannot be traced to any one particular plant or vegetable growth; but that it may be looked upon rather as an embodiment of the abstract spirit of many natural forms—of innumerable wild plants—an abstraction of an abstraction; and that the foliage we now see is such as would come naturally to the sculptor to conceive who had wondered much in wood and dale, and had critically observed the wild plants that luxuriate on the mossy banks of forest glades and flowering hedge-rows. It is to be presumed that the old carver of the 13th century would migrate from city to city, and from village to village, as the necessity might be. And it will be allowed that he could not do so by "*train-de-luxe*," and that it is probable that the old craftsman "stumped" from place to place, and further, that in so doing he would often linger for hours together, in the thick woods that have long since been swept away. Amongst a wild profusion of plant-life he would infallibly draw many an inspiration direct from Nature, that would serve him in better stead than do our books and engravings serve our modern architectural sculptor.

There must be a world of difference in the articles produced on the one hand by the old habit of living and self-culture of the craftsman, and, on the other, by our modern school-of-art taught, and book and illustration-sodden art-workman. The former had nothing but nature as a guide, whilst the latter are dependent upon "examples," or they study nature at secondhand, where their more "primitive" forefathers went to the fountain-head. Our old sculptor would be compelled to draw his inspirations from common country-side plant-life. With every new journey he would replenish his mental storehouse with a harvest of beautiful forms, and in his conventional reproductions of simple plant life, he would day by day be nobly exalting the humble and the meek.

The Society of Architects is to be congratulated on the pleasant and prosperous commencement of its fourth year of existence in its new quarters at St. James's Hall. The rooms have been really well and economically furnished, and are cosy and comfortable. I only find fault with the carpet—it spoils all, and hinders sound; but it will wear out soon, and then the Council had better stain the boards or put down parquet or wood-block flooring. The address of the new President struck me as well thought out and instructive, though perhaps he laid a little too vigorously about the shoulders of that arch-culprit, the "art-architect." Glad to see the rapid increase recently in the Society's member-roll—nearly a hundred fresh members since last session. If the Society goes on like that, it may soon content itself with Registering its own members. Meanwhile I endorse the hearty wishes I heard the distinguished architect of the Brompton Oratory offer—albeit an Institute man—for its success. GOTH.

NOTES FROM EDINBURGH.

THE City Improvement Trust, constituted in 1867, has brought its labours to a satisfactory conclusion, financially and otherwise. The extent of their enterprise may be gathered from the final financial statement, which shows a twenty years' expenditure of very nearly £459,000, the receipts having exceeded this amount by about £1,160. Although improvement schemes have been almost constantly in operation since the old town became too small for the requirements of its growing population, the progress made during the last twenty years is greatly superior in every respect to that made in any similar period before. The growth of the city has been greater, and the character of the improvements of the period in question has had higher aims than meeting the necessary requirements of increasing population. Side by side with this, very much has been done for the embellishment and general amenity of the city. Private gardens have been opened to the public, with other grounds for recreation. The importance of retaining all that can be kept of the characteristic architecture of the old town has become a fixed principle. The old Classic mania having been exhausted, or, rather, having been found wanting in its adaptation to the ordinary street, and notably inferior to the older style, for a site consisting of hills and hollows, the successful completion of Cockburn-street by the Railway Access Company was the result. The public saw for the first time, and with delight, the old city architecture revived, in a grand procession of baronial castles from the new to the old town. Similar architecture followed here and there, as in Forrest-road, Leith-walk, &c., and this happy result was kept in view as a secondary aim of the Improvement Trust. In their extensive reconstructions in the old town the old Gothic of the town has been retained, and though generally less ornate than the designs of Cockburn-street, as being no longer homes of the civic and landed aristocracy, they form an enduring monument of the great care, and taste, and, skill with which the architects of the Trust, the late Messrs. Cousin and Sessels, had devoted themselves to the accomplishment of their task. Their greatest work in this line of operations was the conversion of St. Mary's Wynd into a wide thoroughfare now called St. Mary's-street. This, and its continuation to the north, known as Leith Wynd, divided the city from the Canongate, and was a good point to select for admitting air and light to the crowded land of tenements around. Leith Wynd is now a

thoroughfare with open space to Jeffrey-street, which starts from its connection with the High-street and winds westward to the North Bridge. The closes between this and the High-street have been very much curtailed and hundreds of unwholesome tenements swept away. Blackfriars Wynd, so called as the property, at least in part, of the Blackfriars Monastery beyond the Cowgate, has been widened by demolition of the houses on the east side, the west side being left untouched. This Wynd was the aristocratic quarter of the ancient town, clerical and lay, and in 1874 the Trust removed the house built by Archbishop Beaton and occupied by his son, the famous Cardinal. It was a good specimen of the fortified house of the period. The ground-floor chambers were vaulted, and had a quaint octagonal turret without any windows at the corner of the Cowgate; but the greater portion of the building had disappeared in the changes it had undergone after passing into other hands, and it showed nothing of architectural interest at all in keeping with the traditions of its history.

The operations of the Trust have also opened up a new street from Nicolson-square, Marshall-street, improving the small plot of garden ground and giving a much better aspect to the square.

Another principal part of their enterprise remains to be noticed in the new thoroughfare of Chambers-street, formed out of the demolition of North College-street and Argyle-square, and including access to the Cowgate, with the formation of Guthrie-street behind it, a line of improved dwellings for the working classes.

This part of the scheme has great architectural interest, as opening up to view the north side of the University, the proportions and designs of which may now be seen from the street, which is double the width of the ordinary thoroughfare. The buildings here are all of a highly ornate style, with somewhat ponderous Renaissance detail, and the old college looks severe and plain in the contrast. It might be of advantage to give it now some of the ornamental detail in stringcourses, &c., which the architect had not withheld from the side in South College-street.

Chambers-street is conspicuous by the palatial proportions of its shops at the east end and by the long frontage at the new Heriot-Watt College at the west. This latter is just finishing, and the doorway built by the Trust for the Watt School of Arts is being replaced by one more suitable for the larger building, which has had extensive wings added to either side.

This street connects the work of the Improvement Trust of 1867 with that of the preceding improvement scheme started about fifty years before it, and makes communication with the east and west of the new town complete. The improvements of the earlier scheme were mostly concerned with providing better means of communication within the city, and its principal work was the new road opened up from the west of the new town, round the Castle rock, and by George IV. Bridge to the meadows. It did not aim at or accomplish much in the way of reconstruction; but the lofty range of tenements between the Lacon Market and Victoria-street, with the Highland Society's buildings next the site of the new Free Library, were built by the architect of the Trust, the late Mr. P. Smith. These are in the Elizabethan style, of ornate character, and form an excellent adjunct to the old architecture of the High-street, with which they form no unpleasing contrast. The bridge erected by the Trust was originally intended to be kept clear of buildings on either side for three of its spans; but the demand for building sites has been too great, and when the new library is erected the street will be built closely up to the limits of the Cowgate and the single arch which spans it. Unfortunately, the buildings to the south of the bridge are all of the ungabled, commonplace street architecture of the modern town, and make a miserable finish to what had been so well begun, and what has been more lately carried out with excellent taste in the Scotch Gothic in Forrest-road.

The Trust have also done something for the improvement of the overcrowded spaces on the West Port by making a spacious thoroughfare of access at the head of it to Cambridge-street and improving Lady Lawson's Wynd. The old houses opposite King's stables, on the North side of the Grass Market, and which projected inconveniently, have been taken away, and the Robertson Memorial Buildings in the Scottish style, fill the vacant space, hitherto occupied by the inseemly and unsanitary erections.

The great object of the improvement scheme, however, apart from the formation of better thoroughfares, was sanitary, and it has done much to improve the localities where it has been in operation, if the statistics of mortality for the old town districts are to be relied on. The average rate of mortality for the city about 20 years ago was from 28 to 30 per 1,000, and is now from 18 to 20. The reduction of the rate is most perceptible in the returns from the old town, where the drainage improvements carried out in the north and south have no place to speak of in determination of results.

But the evil of overcrowded districts is not to be overcome by any one improvement scheme, and the sanitary labours of the Trust have been supplemented by private enterprise and in other ways. Then the new street, called St. Giles, swept away a number of insanitary dwellings, and as old houses are falling to decay they are generally replaced by dwellings in which the Guild Court have power to insist upon proper provision for the sanitary condition of the rooms and accessories.

The inauguration of the public baths is another factor in the same direction, and these have proved so popular that there is a talk of providing a similar institution for the populous districts in the west.

The 20 years of the Improvement Trust includes what will be long and well remembered as the school-building period, and though the Watt Institution for many years has given some technical instruction, with popular scientific lectures, it is only now that, as the Heriot-Watt College (its development), it can be said to provide a complete course of theoretical and practical study in commercial and industrial pursuits.

The commencement of the Free Library has been delayed, some legal difficulties as to the plans and site having emerged. It is another memorial of the period from which a new and better Edinburgh is expected to rise.

CONVENTION OF THE AMERICAN INSTITUTE OF ARCHITECTS AT CHICAGO.

IN the recent Convention of the American Institute of Architects held at Chicago several topics were discussed. The report of the Committee on Education was read. Mr. A. J. Bloor, who had charge of the school of architecture, gave a descriptive account of the courses pursued at the University of Illinois, to which we may refer. There are two courses of study now adopted. 1. The builder's course, composed of nine studies, intended for the benefit of builders and mechanics. 2. The architect's course, which requires four years of hard work. This course is now as follows:—First year: (1) Trigonometry, projection, drawing, shop practice, French; (2) analytical geometry, descriptive geometry, shop practice, French; (3) advanced algebra, graphical statics, shop practice, French. Second year: (1) Elements of wood construction, calculus, freehand drawing, and modelling; (2) elements of stone, brick, and metal construction, advanced analytical geometry, architectural drawing; (3) elements of sanitary construction, advanced calculus, water-colour sketching. Third year: (1) Architectural drawing, analytical mechanics, chemistry; (2) history of architecture, resistance of materials; (3) history of architecture, advanced descriptive chemistry, physics. Fourth year: (1) Æsthetics of architecture, perspective, history of civilisation; (2) Architectural designing, heating and ventilation, constitutional history; (3) architectural designing, estimates, agreements, specifications, political economy.

Mr. Adler read a paper on "The Paramount Requirements of Large Theatres." Referring to the means of ingress and egress, he said, "No allowance less than 3ft. for every two hundred persons in determining the width of aisles, doors, and stairways should be considered. A large number of narrow aisles is to be preferred to a small number of wide ones. Aisles should lead as directly as possible to doors. The corridors and lobbies should be of sufficient size to hold more than one-half o the audience. The stairways should hav frequent landings, and the exits should be s disposed as to tend to disperse the audience a rapidly as possible." Mr. M. E. Bell read paper on "The Paramount Requirements of National Building for Custom House, Judicial and Postal Purposes"; Mr. W. W. Boyington one on "Differences Between the Methods o Architectural Practice Now and Fifty Year Ago"; Mr. L. H. Sullivan, a paper on "Oper Houses"; and another by Mr. Wilson "O Where the Line of Demarcation Between En gineering and Architectural Practice is to b Found."

METROPOLITAN RAILWAY BRIDGES.

RECENTLY, renewed complaints have been made about the percolation of water through the brick arches and flat girder soffits of the bridges crossing streets in the metropolis. The other day reference was made to the subject in the House of Commons. Wherever these bridges exist much inconvenience is experienced by those who have to pass under them, owing to the constant dripping of water which finds its way through them during rainy weather. We called attention to this subject some years ago, and we believe something was done to mitigate the nuisance in certain quarters. There is much, however, remaining to be done to render these arches and vaults weatherproof and dry. Scores of vaults forming the viaducts of the South-Eastern, Chatham and Dover, and other railways are let at good rents for workshops, stores, and shops, but even some of these are liable to the same inconvenience. We public at any rate have a right to be protected from the drippings from the bridges over the pathways and roads; but we suppose the Metropolitan Board of Works are powerless to interfere. These railway bridges are by no means ornaments to the localities in which they occur, nor are they beneficial to houses near them. They invariably deteriorate the property. The noise and constant rattle and roar of the railway traffic, and the darkening of the thoroughfares, are serious hindrances enough without the dampness and rotten roadways which are found beneath these bridges.

There is greater reason then why the public should be protected from the nuisance of water coming through, and the Metropolitan Board of Works appears to be the right authority to enforce certain conditions in these structures over public thoroughfares. We can point to several such arches near Loughborough Junction, at Norwood, and elsewhere. The construction of these bridges is faulty. Various modes of covering the flat girder bridges are resorted to. Sometimes the spaces between the cross girders have iron plates like those seen under the bridge at Charing-cross carrying the South-Eastern line over the Embankment. At other places we find planking is used to carry the ballast, which get rotten and quickly let through the water. Of these soffits, the channelled or Lindsay's deck plating affords the best security, especially when the channels are filled up with concrete and asphalted. Generally over the footways we meet with an expedient for carrying off any water that comes through in the shape of plates of corrugated iron, which are sloped to the abutments, and fall into a gutter; but experience has shown what very temporary remedies these are at the best. Their unpleasant rattle as a train passes over is well known by the London pedestrian.

The brick arch or vault is equally subject to percolation. Here the fault lies with the "backing" and construction. If it was properly filled up over the piers with concrete, on the spandrels, and a drain carried through the pier from the lowest point of the backing, the arch would be properly drained. But the imperfect construction and the stoppage of the drain-pipes causes the spandrels to become saturated after a rainfall, and the water to find its way through the mortar joints and brick rings of the arch. The only proper way to prevent percolation of moisture is to shape the backings to proper outlets, and thoroughly cover the surface with the best asphalte, say the "Seysell" (Claridge's). One or two good layers of ¾in. asphalte over the crown, sloping

down to the invert curve over the piers, and carried up the spandrel walls of bridge, would effectively prevent the percolation of water through the brickwork. This precautionary measure ought to be made compulsory upon all railway bridge contractors. Every vault through a town, and especially those over the public streets, should be so treated. The flat girder bridge above the soffit should form a perfect tray of asphalte, of course draining to proper outlets. These precautions are not likely to be carried out till the public call attention to them, or till those who have vested interests in the neighbourhood of these arches complain. The Board also notify their intention to ask for leave to bring in a Bill empowering them to make a new tunnel instead of the one authorised by the Thames Tunnel (Blackwall) Act of 1887. It is proposed to construct the new tunnel on the western side of the one authorised by the Act of last Session.

ST. CUTHBERT'S CHURCH, KENSINGTON.

THE Bishop of London has appointed to-day at 8 a.m. for the consecration of this important new church, which, with its adjoining clergyhouse, has been erected from the designs of Mr. H. Roumieu Gough, of Carlton-chambers. The building, which provides accommodation for 950 worshippers, consists of chancel 28ft. 6in. by 42ft., nave 28ft. 6in. by 87ft., north and south aisles 12ft. 6in. wide, morning chapel 16ft. 6in. by 42ft.; sacristy and organ-chamber on the ground floor, and large vestries for clergy and choir in the crypt, which is formed under the whole of the east end of the church, and which contains also a room for public meetings or Sunday school-purposes 28ft. 6in. by 40ft., and a large mortuary chapel. The style of the building is Early Decorated, the facings being of red brickwork, and the dressings, both externally and internally, of Corsham stone from the quarries of Messrs. Randall and Saunders. The contractors for the works were Messrs. S. Belham and Co., of Buckingham Palace-road. The most noticeable features of the interior are the east front and the flêche. The former is remarkable as having no window openings; the gable end rises to a height of 75ft., and is flanked on each side with octangular stair turrets leading to the parapet gutters. Between these turrets is a lofty and boldly-moulded arch which incloses two tiers of niches for life-size statuary. The flêche, which contains a sanctus bell from Messrs. Taylor's foundry at Loughborough, is a tall and graceful feature, having a height of 70ft. above the main roof. The spire, with its numerous crockets, finials, gurgoyles, &c., is covered with copper, and this was intrusted by the contractors to Messrs. Ewart and Son. At for the west end of the nave is a bell gable for three bells, one only being at present provided. The interior of the church has an imposing effect, owing partly to its well-proportioned arcades of seven bays on each side, five being in the nave and two in the chancel. These are surmounted by a lofty clerestory, and the whole is covered with a barrel vault with moulded ribs; but this greatly needs decorating. Certainly the most striking feature of all on entering the building is the lavish use of polished Devonshire marble in the clustered columns and responds supporting the arcades, which, together with their richly moulded caps and bases, were supplied by Messrs. J. and E. Goad, of Plymouth. The detached shafts are all monoliths of rare beauty, and are the largest ever sent from these celebrated quarries. One would suppose that these alone would cost more than many a parish church; but we are informed by Mr. Gough that had he used Portland stone instead the saving would have been far below £1,000. The polished marble steps in the chapel, and the columns for the pulpit and sedilia, are also from Messrs. Goad's works. The heating is by Messrs. Musgrave's slow-combustion air warmer. Some very beautiful stained-glass windows are provided in the baptistery, designed by Mr. Kemp, and others are to be put in the morning chapel at once. Messrs. Tomes and Wimpey were the sub-contractors for the stone work; and all the elaborated and deeply undercut mouldings are well executed. The carving throughout is very admirable. This was intrusted to the Baron Felix de Sziemanowicz, of Hurley-road, Kennington, who also has carried out the Caen stone pulpit, and has in hand the sedilia, piscina, &c. Mr. Cassé acted as foreman from the commencement of the works in 1884 until his removal to the Aberystwith College a few months ago, since which time Mr. Bourne has proved an able substitute.

Mr. Gough's new church of St. Lawrence at Catford Bridge is to be consecrated by the Bishop of Rochester to-morrow (Saturday); but we reserve our description of the building till next week.

BOOKS RECEIVED.

Handbook for Steam Users. By M. POWIS BALE. (London: Longmans, Green, and Co.) This useful little work, published at half-a-crown, contains succinctly arranged rules for engine-drivers and boiler attendants, also notes on steam-engines and boiler management, and steam-boiler explosions, with hints on how to prevent them. The work is an expansion of the author's "Chart of Rules for Engine-Drivers," and contains in a small space much reliable information.——*First Aid to the Injured—The Ambulance Pupil* (London: Crosby Lockwood and Co.) is a pocket handbook giving, in a concise form, what should be done in the case of accidents by non-professional persons before the arrival, or in the absence, of a medical man.——*Transactions of the St. Paul's Ecclesiological Society.* Vol. II. Part II. (London: Alabaster, Passmore, and Sons.) The new volume of these *Transactions* contains the full text of the papers read before the S.P.E.S. last session, including Mr. B. Edward Ferrey's valuable lecture on "Symbolism in Ecclesiology"; an account by the Rev. C. L. Acland of "The Most Remote Church in the British Islands," the ruins of a Celtic church on the Seal Skerry, beyond Rona, and nearly 50 miles north-west of the Island of Lewis; "An Architect's Views on Modern Church Building," by Mr. H. Roumieu Gough; "English Mediæval Chalices and Patens," by Mr. W. H. St. John Hope, with many illustrations; "The Ecclesiology of the Roman Catacombs," by Mr. Charles Browne; and "Some Little Known Churches near London," by Mr. W. Bolton. Many of these lectures were reported at the time of delivery in our columns. Among the illustrations are a new plan of the Charterhouse, London, on a scale of 44ft. to 1in., by Mr. R. H. Carpenter, redrawn on stone by Mr. Thos. Garratt, and the restored apse of St. Bartholomew's, Smithfield.——In the *Architectural Association Notes* for November, the Editor, Mr. Herbert D. Appleton, deals with the subject of the proposed affiliation of Provincial Associations with that body, remarking that among the advantages it would afford the branches would be (1) greatly increased facilities for obtaining technical books by the use of the lending library; (2) the formation of classes for study in connection with the London classes; and (3) great increase in the stability of the Provincial Associations. A sub-committee of the London A. A. is now engaged in framing rules for the affiliation of branches. Other features of the *Notes* are illustrated accounts of a town in Calvados and the A. A. Excursion to Italy by Messrs. R. A. Rix and Ernest Mallet, and an account by Mr. R. Phené Spiers' of the way in which he and his companions, the Messrs. Goddard, of Leicester, were followed and questioned by officials at every town and village during a recent sketching tour in France under suspicion of being German spies, and Mr. W. M. Fawcett contributes some notes on "Architecture on the Norfolk Broads."——*Textbook of Projectional Solid Geometry.* By W. E. CROWTHER, Science and Art Master. (Manchester: John Heywood). This appears to be an improved textbook or system of learning plane and solid geometry. The author—judiciously, we think—has given precedence to solid geometry, and so has called out the imaginative powers of the student before he is taxed with the subject of plane geometry. To the student of architecture especially, and all to whom the exercise of the constructive imagination is essential, solid geometry is one of the best preparations. As the author says, it is much easier for the student to pass from solid geometry to plane than from plane to solid. The author has selected the problems with an intelligent regard to the principles involved in their construction. For the elementary stage of the examination of the Science and Art Department, Mr. Crowther's little book will give all that is necessary; the diagrams are well engraved, and the examples concisely worked out. A section on plane and arithmetical geometry follows.——In a pamphlet entitled *Strata Florida Abbey*, Mr. STEPHEN W. WILLIAMS, F.R.I.B.A., has reprinted from Vol. IV. of the "Archæologia Cambriensis," his report on the excavations made under his supervision this spring on the site of this abbey. The ground-plan outlines and general dimensions of the church were ascertained during the work, and it was found that Strata Florida was larger than any other Welsh cathedral, abbey, or church, with the exception of Abbey Cwmhir, the measurements being a total length of 213ft., of which the nave constituted 131ft. 6in.; breadth across nave and aisles, 61ft.; ditto across the transepts, 117ft. 3in. by 28ft. deep; while the choir was 52ft. 6in. long by 28ft. across. Of the present building, the only portions of walling above ground when the excavations were commenced were part of the west front and the north-west angle of north transept. The abbey, Mr. Williams shows, was founded by Rhys ap Gruffydd, Prince of South Wales, and was built between 1150 and 1203. Four kinds of stone were used in the work, which was, as at St. David's Cathedral, executed in alternate bands of coloured stone, and the plan and general design bear a striking resemblance to the portion of that cathedral built by Bishop de Leila after 1176. The excavations have yielded some fragments of carved work and glazed tiles. A ground plan of the abbey and a reproduction of Buck's view of the ruined west front as it appeared in 1741 accompany the report.

CHIPS.

At the meeting to-day (Friday) of the Metropolitan Board of Works, the Works Committee will recommend the board to contribute £1,000 per acre towards the purchase of Carron House, in South Lambeth-road, and of Raleigh House, Brixton Hill, as public pleasure grounds. To this Mr. F. H. Fowler will move as an amendment that the board contribute £1,500 on condition that the Lambeth Vestry contribute a like amount.

The Royal Commission on Irish Public Works has concluded taking evidence on the subjects of fisheries, harbours, and railways, and will proceed to the preparation of a report dealing with those subjects.

The bells of the parish church of Elham, East Kent, were rung on Monday after 12 years' silence. The spire in the tower, which was considered dangerous, has been entirely rebuilt by Messrs. Warners and Son, of London. Mr. Joseph Clarke, F.S.A., of London, was the architect, and the outlay was £750.

A large clock with three dials, each 4ft. 6in. across, has just been completed at Bladon Church, near Blenheim, Oxfordshire, by John Smith, Midland Clock Works, Derby. It was started by the rector and churchwardens on the 10th inst.

A grant not to exceed £150 has been made by the Senate of Cambridge University from the Worts Travelling Scholars' Fund to Mr. H. B. Smith, B.A., of Trinity College, for the purpose of archæological research in Cyprus, on condition that the objects obtained by means of this expenditure become the property of the University, and that Mr. Smith furnish a report on the results of his researches to be published.

The Dowager Lady Penrhyn has placed in the church of St. Tegai, at Llandegai, a five-light east window, representing the Ascension, in memory of her husband; while Lord and Lady Penrhyn have presented a reredos in memory of the late nobleman. The subject of the sculptured panel is the Resurrection, treated after the manner of Fra Angelico. The walls of the chancel are to be treated with mosaic subjects similar to those in Chester Cathedral.

A large clock and chimes have just been erected in the parish-church of Hope, in the Peak of Derby. It strikes the hours upon a large bell, and chimes the Westminster quarters upon four bells. It is fitted with all the latest improvements. The work has been carried out by Messrs. John Smith and Sons, Midland Clock Works, Derby.

The inaugural meeting of the winter session of the Architectural Section of the Glasgow Philosophical Society, was held on Monday night, when an introductory address was given by the president, Mr. James Thomson, F.R.I.B.A., on "The Architecture of Glasgow during the last Fifty Years."

Building Intelligence.

BRISTOL.—On Wednesday evening the ex-Mayor of Bristol, Sir George Edwards, laid the top stone of the tower of St. Agnes' Church. The tower was illuminated with the electric light. The church was consecrated in March, 1886. After an interval of fifteen months the tender of Mr. A. J. Beavan to complete the tower for £1,720 was accepted, and the work was commenced early in June. The height of the tower to cornice is 94ft., and to top of turret 130ft.; the width is 20ft. The octagonal turret, which is 36ft. in height from the cornice, is richly carved. At the angles are crockets and finials; pinnacles, 18ft. in height, rise from the other three corners of the tower. The tower is constructed of tinted Pennant stone from Fishponds, with dressings, battlement, and turret of Box-ground stone. Mr. W. Wood Bethel, London, is the architect; the carving was executed by Messrs. Davey and Bushell, Bristol; and Mr. G. Downs has acted as clerk of the works. The total cost of the church, including fittings and site, has been £9,520.

CHESTER.—A consistory court was held at Chester Cathedral on Friday week. The vicar and wardens of the parish church of Waverton were granted a faculty to take down and rebuild the present north wall of the church, to erect a new chancel screen, to put in a new heating apparatus, and generally to repair and restore the church. The estimated cost was £600.—The vicar and wardens of St. Paul's, Macclesfield, applied for a faculty to remove the organ from its present position to the east end of north aisle, to re-arrange seatings, and erect choir stalls near the organ, at a cost of £120, defrayed by voluntary contributions. The faculty was decreed.—The vicar and wardens of St. Mary's, Liscard, applied for a faculty for the erection of a peal of eight bells in the tower of the church, for the erection of an iron screen across the tower arch, and the expense (about £600) to be borne by Mrs. Brooks. The faculty was decreed.

HUCKNAL TORKARD.—The Duke of Portland laid on Monday last the memorial stone of the new chancel and north and south transepts which are being added to the parish church of Hucknal Torkard, Notts. Mr. R. C. Clarke, of Nottingham, is the architect, and Messrs. Fish and Son, of that town, have taken the contract at £3,734. Some opposition has been raised to the scheme on the ground that it might interfere with Byron's tomb, but it is stated that this will not be disturbed, and the block of marble sent for the purpose by the King of Greece, and embellished with a laurel wreath wrought in brass by Mr. Richard Belt, which marks the poet's grave, as well as the tablet to his memory, and the mural monument in memory of his daughter, Lady Lovelace, will, after the restoration, occupy the same positions relatively to the grave as they now do.

MANCHESTER.—A consistory court was held on Friday week. A faculty was granted to the wardens of Holy Trinity, South Shore, Blackpool, to allow them to take down the east end of the church, including the transepts and a portion of the nave and chancel, for the purpose of extension. The estimated cost of the alterations was £4,800, and the accommodation will be increased by 300 seats.—A faculty was also decreed to the curate-in-charge and churchwardens of St. Michael's, Flixton, to enable them to enlarge the burial ground, and to rebuild or restore the church tower, which is unsafe, from the present belfry. The cost of the latter work will be about £1,600, and Mr. W. S. Crowther, of Manchester, is the architect.

ST. HELIER'S, JERSEY.—The church of St. Thomas, recently erected by the French Fathers Oblates of Mary Immaculate, was solemnly opened on Sunday week. The edifice is not yet complete, but is sufficiently advanced to be used. The church, which seats 2,000 persons, occupies a site adjoining the parish schools of the Christian Brothers. The style is French Pointed, of the 13th century. The ground plan comprises a nave with side aisles and two transepts, forming a Latin cross with the chancel, which has two side chapels. There is also a sacristy on either side of the chancel. Behind the high altar will be placed a group of sculpture representing the Apparition of the Sacred Heart to the Blessed Margaret Mary Alacoque. The tower of the church is placed at the east end, and exactly in the axis of the building. On either side are two small chapels, one of which will serve as the baptistery, while the other will contain a representation of the Grotto of Our Lady of Lourdes. Over the principal entrance there is erected a tribune, intended to hold the organ and extra choristers. The arcades of the nave and choir are supported on either side by nine clustered columns of Caen stone, each surmounted by a carved capital. The height of the nave is 60ft. from floor to roof; of the side aisles 30ft. The vaulting of the roofs in the nave, transept, and principal chapels thereof is of stone with moulded ribs. The walls are strengthened interiorly with buttresses, which form compartments, in which are placed the confessionals. The entire height of tower and spire will be 196ft. The altar of the Lady chapel is already in position, and is of white, slightly veined marble. The pulpit, the benches, and the confessionals are of dark oak, carved and varnished. The windows will be filled with stained glass. The architect is M. Alfred Frangeul, of St. Malo, who has already carried out in Jersey the Convent of the Dames de Saint André, the Church of St. Matthew, situate in the outlying parish of St. Laurent, and a Convent of the same order adjoining St. Matthew's.

WAINFLEET, ALL SAINTS, LINCOLNSHIRE.—A new chancel, with organ-chamber and vestry, have been erected here, having walls faced with white bricks, with Bath-stone dressings. The old east window and two side windows from the cruciform church, pulled down in 1809, have been refixed. A new chancel arch of bold Perpendicular design has been built; also arches to aisle, and organ-chamber. The roof of pitch pine, is divided into three sections by moulded principals springing from carved corbels. The floor is of Wilkinson's granitic specular paving and white Mansfield steps; the stalls of pitch pine, with solid ends and moulded framing. The expenditure thus far is £850, but it is contemplated to reseat main edifice at a cost of £300. The carving was executed by Mr. S. Allen, of Holloway, London. The work has been carried out by Mr. John Holmes, of Wainfleet, from the plans, and under the superintendence of, Mr. J. B. Corby, architect, of Stamford.

WEDNESBURY.—The Bagnall memorial chapel and four new vestries, recently added to St. James's Church, Wednesbury, were dedicated on Saturday. The new chapel is on the north side of the chancel, with which it is connected by an arcade of three arches. It is fitted up with an altar and piscina, and above the altar hangs a copy of Rubens's "Descent from the Cross," the gift of Mrs. J. N. Bagnall, below a rose window. The chapel is 33ft. long by 21ft. wide, and will seat 100 worshippers, raising the total accommodation afforded by the church to 835. The vestries are ranged round the east and south sides of chancel, and comprise churchwardens' vestry, 14ft. by 9ft.; priests' vestry, 16ft. by 9ft.; choir and guild's vestry, 46ft. by 9ft.; and sisters' vestry, 12ft. by 9ft. The exterior is faced with ashlar stonework from Codsall quarries. The architects are Messrs. Horton and Scott, Wednesbury, and the builders Messrs. B. Clarke and Co., Birmingham; and a new heating apparatus has been inserted. The cost has been about £1,300.

WINCHESTER.—The restoration of the rich upper portion of the altar screen at Winchester is now completely finished. Since the contract works carried out by Messrs. Trask were brought to an end about three months ago, the Dean and Chapter have carried on the restoration in their own yard. In these three months the whole of the cresting of the two wings has been made good, involving the fitting in of more than sixty pieces of carved stone; and eighty-four pinnacles and gable ends, richly carved and crocketed, have taken the place of the plaster finishing which had long done duty for stone. The whole has also been cleansed, and the masons are now engaged in fixing the canopies and pedestals for the side niches, destined to carry the smaller statues. These, which will entirely change the appearance of the side splays, are twenty-six in number. It is believed that the whole of the stonework, if means a found to carry on the work, will be complet before Midsummer next. The Cathedral Cor mittee has recommended to the Dean a Chapter that the statues in the "Jacob M morial" portion should be all wrought by M Nicholls, of Wincott-street, London.

COMPETITIONS.

LUDLOW.—For the proposed market-hall, th town council recently received 21 sets of plan From these the committee, assisted by M Thompson, of Hereford, selected and recom mended the award of the first premium of £2 to that numbered 13 by Mr. Straight; th second, of £15, to Mr. Thomas M. Lockwood, o Chester; and the third, of £10, to Mr. Price The town council has adopted the report.

MAIDSTONE ASYLUM.—The final stage in th long-pending competition for the new boroug asylum for Maidstone, proposed to be erecte on Abbeygate Farm, East Farleigh, has now been reached. It will be remembered that in May last Mr. H. Saxon Snell, F.R.I.B.A., the assessor to the Maidstone magistrates, reported that of the 48 designs sent in, the first prize should be awarded to "No. 31," although, he added, "I am bound to say it is much more expensive than the other designs." "No. 31," it has since been ascertained, was by Mr. Edward W. Stephens, of Maidstone. "No. 33," by Mr. E. B. Oliver, Guildford-street, W.C., was placed second; and "No. 24," by Messrs. Coulthurst and Booty, of Derby, third. Mr. Snell was then asked by the magistrates to report upon the plans estimated to cost £30,000 (nine in number); but he pointed out that this would be unfair, as no distinct limit of cost was stated. It was complained by the magistrates that some of the instructions to architects had been infringed by some competitors; but Mr. Snell replied that he had already decided that the competitors had done right in obeying the spirit rather than the letter of the regulations. Subsequently to the return of the rejected designs and the announcement of the name of the successful competitor, the magistrates received numerous letters from competitors complaining that Mr. Stephens had not kept his buildings within the part of the site marked red, and decided to invite the competitors to return their designs for a re-examination. Thirty-four of the forty-two competitors complied, and the designs were again scrutinised by the committee, and afterwards, by the assessor, who found that only two of the thirty-four had substantially kept the buildings and airing-yards within the red portion of site; four others had kept the main buildings only within the red space; in the other twenty-eight plans the buildings are not within the space. Further, Mr. Snell found that not one of the competitors had strictly complied with all the regulations. The magistrates have, therefore, adopted Mr. Snell's recommendation, and have requested Mr. Stephens to report how his design can be much lessened in cost by the reduction of some superfluous accommodation. All the other plans are to be sent back, carriage paid, and with an expression of thanks, and accompanied by a copy of Mr. Snell's three reports.

At a meeting of the St. Paul's Ecclesiological Society, held on Wednesday evening at the Chapter House, St. Paul's, a paper was read by Major Alfred Heales, F.S.A., on "The Ecclesiology of Gothland." The lecture treated upon the archaic characteristics of and peculiarities of the churches of this little-known island, and was illustrated by numerous photographs, specially taken for Major Heales, and by rubbings of brasses. Remarks were afterwards made by Mr. Charles Browne, the chairman, Dr. J. S. Phené, who accompanied Major Heales in his visits to Gothland, Mr. G. H. Birch, and others.

It is stated that a site is about to be acquired in the interest of some of the seceders from the Grosvenor Gallery for the erection of a new picture gallery, of which Messrs. Comyns Carr and C. Hallé will have the management, and in which the original Grosvenor traditions will be as far as possible kept up. If the negotiation succeeds, the new gallery will be completed in time for the spring exhibition season.

Mr. E. Thorrold, of Stockton, was elected on Tuesday surveyor to the Redditch local board at a salary of £150 a year.

Engineering Notes.

Manchester Ship Canal.—The first sod of this undertaking was cut by Lord Egerton of Tatton at Eastham Ferry on Friday. The canal will be 26ft. deep, and will have a minimum width of 120ft. The only section now in progress is that from the outlet into the Mersey at Eastham to Ellesmere Port, some 4½ miles inland. The lower portion of the works, which are entirely in Cheshire, are being undertaken first in order that the canal may be worked as portions are finished. Mr. T. A. Walker, of London and Manchester, the contractor, has divided the canal works into nine sections of 4½ miles each, and on the Eastham section over 2,000 men will presently be fully employed. Taking this section as an illustration, the canal will require for the next four years the services of 20,000 persons. Mr. Walker's contract for the canal is six millions. Mr. Leader Williams is the chief engineer of the company, Mr. J. Abernethy the consulting engineer, and Mr. W. Hunter, the assistant engineer. Mr. Walker has brought together an immense plant, including, on the present section, fifteen locomotives, numerous steam excavators and cranes, and a daily increasing supply of timber, steel rails, and waggons. For the last-named requisites the Ashbury Railway Carriage Co., Openshaw, Manchester, have contracted to deliver 100 waggons each week till May next. Mr. Walker is locally represented by Mr. Topham, of Manchester, and by Mr. Manisty, the district agent for the first section.

The Forth Bridge.—During the past two months satisfactory progress has been made at this bridge. With the stoppage of the greater part of the night work, however, the same rapidity will not be observed during the winter months. The pick of the men engaged on the night shift have been retained for day work; but about 500 men have been dismissed, and the total number of persons now employed is a little over 3,500. The riveting of the top members between the vertical columns on either side of the Forth has been completed, and already 60ft. of work beyond this has been accomplished. Steam and hydraulic cranes are being placed in position on the top members, for the purpose of raising material from the bottom, a distance of 360 or 370ft. These cranes are moveable, and will be slid down as the work proceeds on the slope. The superstructure of the vertical columns on the three piers has been finished, the riveting having been completed a few days ago. Messrs. Thomas Aimers and Sons, engineers and moulders, Galashiels, have been turning out some heavy castings for the bridge works, ranging from 7 to 13 tons.

CHIPS.

A Congregational school, Italian in style, has just been opened at Wibsey, near Bradford. The cost was £2,400, and the architect was Mr. S. Robinson, of Bradford.

A new theatre, seated for 1,200 people, has just been completed at Crewe from plans by Mr. Alfred Darbyshire, of Manchester.

The new town hall at Stourbridge presented by private donors at a cost of £5,000, was formally opened on Monday. It has been erected from designs of Mr. Thomas Robinson, of Stourbridge, selected in competition, by Mr. John Guest, contractor. It is Renaissance in style, 76ft. by 46ft., and 38ft. high, and is built with red bricks and dark red terracotta dressings, both supplied by Messrs. Joseph King and Co., of Stourbridge. In unison with the town hall, and also from Mr. Robinson's design, the Improvement Commissioners are erecting town offices, fire-brigade station, and corn exchange, at a cost of £2,400, and in the centre of the whole block of buildings, a tower is being erected 100ft. high.

Irnham Hall, near Grantham, Lincolnshire, was on Saturday evening destroyed by fire, the damage exceeding £13,000. The mansion was erected about 1510, and was a fine example of the Tudor style. Irnham was one of the fifteen manors given by William the Conqueror to Ralph Paganet.

Mr. John Paterson, the newly-elected Provost of St. Andrews, N.B., has offered to construct an esplanade at the Links at his own cost. The scheme includes an addition of nearly three acres to the Links protected by a concrete sea-wall, and will probably cost the donor about £1,200.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham and Midland Institute.—Professor P. Gardiner, Litt.D., lectured before this Institute on Monday on "Some Early Athenian Vase Paintings." The lecturer said that the early art of Athens differed from the art of Mediæval Italy and that of modern Japan, in that it was not derived from elsewhere, and was of greater truthfulness and promise. Art had had many nurseries, but only one mother, and that mother was the land of Homer, of Æschylus, and of Phidias. We had no Greek paintings which gave us a just idea of what Athenian pictures were at their best, and in particular there was a scarcity of early examples. We could, however, glean some idea of the painter's art in the 5th century from a study of the coloured drawings which some artists of the time executed on terracotta vases placed in the tombs of the dead. They were executed by Polygnotos, the reputed master of Phidias, by Euphroneus, and others, and extended over a period of about 100 years, beginning in 480 B.C. After the date of 400 B.C. the art of vase-painting, in the opinion of archæologists, declined. The drawing became freer, the subjects more varied, the groups more complicated, and the perspective more manifest; but the clearness, brightness, and severity which marked the earliest paintings disappeared, and with them the care and finish of execution.

Birmingham Architectural Association.—The first ordinary meeting of the current session was held in the library at Queen's College on Tuesday evening. Mr. W. Doubleday, vice-president, took the chair. Eleven gentlemen were nominated for membership. A paper was read by Mr. J. W. Bradley, B.A. (Lond.), entitled, "A Gossip about Old MSS." The lecture was illustrated by many fine examples from illuminated manuscripts. A vote of thanks, proposed by Mr. Doubleday, and supported by Mr. W. H. Bidlake and Mr. Victor Scruton (hon. sec.), was unanimously accorded to Mr. Bradley for his very erudite analysis of this once famous art.

Edinburgh Architectural Association.—The opening meeting of the association was held on Thursday, the 10th inst., in the new Architectural Hall of the Association, 42, George-street, Edinburgh. Mr. Hippolyte J. Blanc, the president, delivered the opening address, the subject being the "Architectural Student," with reference to his professional training. He reviewed the position of the architectural student at a time previous to fifty years ago—when his training was practical, but when, with more leisure for master and pupil to come into relation with each other than in the present, the school was a good one, as evidenced by works of which that city could claim many examples. He contrasted with this the position of the student of the present day, who had many advantages that the student of fifty years ago did not have. The literature of the profession had been greatly increased and cheapened. It was during the last fifty years that the text-books on the theory and practice of architecture had been published; and in addition almost all the works on sanitary science, materials, and construction had been published since 1870. Further, the architectural societies had come into existence within the past fifty years to improve the means at the command of the student. At the same time more was required of the architect of to-day than had been in the past. The whole circle of sciences were of use to him, while with all his advantages there was no systematised course of study available for him, and the president, accordingly, urged the necessity for a well-directed course of study on the part of the student, concurrent office practice, and University recognition. There were schemes of instruction in London, but they wanted academic combination and organisation, and in that city he enumerated valuable aids to the training of the architect in the Museum of Science and Art, the Fine Art Chair at the University, the School of Design, and the Heriot-Watt College. It was imperative, however, that something more should be done for the student, and he threw out in this connection a suggestion as to a Scottish Institution of Architects. In Great Britain they were far short of the liberal system of the French schools, and he raised a question as to whether the Royal Scottish Academy might not be approached to give lectures or otherwise, that the services of some eminent architect or artist might be secured for that purpose. He urged too, in closing, that much might be done if the Edinburgh University were to grant a degree in architectural science. At the close Mrs. Blanc presented the prizes won in the classes conducted under the auspices of the association. Professor Baldwin Brown, in moving a vote of thanks to the president, said that, speaking with authority, he felt quite sure that the Senate of the University would be only too anxious to further in every way a movement in which they would so heartily sympathise. Mr. D. W. Stevenson, R.S.A., supported the chairman's suggestion as to a Scottish Institute. As regarded the proposal that the Royal Scottish Academy should meet the needs of the association, he pointed out that the academy had its own claims to meet, but he suggested that they might ask. In that way they would get something sooner than if they did not ask at all.

Royal Scottish Academy.—The annual meeting of this Academy was held at Edinburgh on the 9th inst., the president, Sir W. F. Douglas, in the chair. The council for the ensuing year were elected as follows:—Sir Wm. Fettes Douglas, president and trustee; D. W. Stevenson, Waller H. Paton, John Hutchison, Otto T. Leyde, W. F. Vallance, Robert Herdman; George Hay, secretary and trustee; John Hutchison, treasurer and trustee; William M'Taggart, trustee; Robert Herdman and Robert Gibb, auditors; Otto T. Leyde, librarian; W. F. Vallance and D. W. Stevenson, curators of library; Otto T. Leyde, Robert Gibb, W. D. M'Kay, and J. Lawton Wingate, visitors of the Life Academy; and Clark Stanton, curator of Life School. The annual report, which was submitted, gave a *résumé* of the year's proceedings. The librarian and curators reported the addition of a number of art books and prints to the library. The visitors of the Life School reported its continued prosperity. The average daily attendance was nearly 35, as against 26 ten years ago. A very marked improvement was noted in the studies in colour during the past session, although (especially in the drawings) in regard to the purity of outline there was still much to be desired. The council awarded the prizes as follows:—The Chalmers Bursary, John Briggs and W. Marshall Brown, equal; for the best drawing from the life, David Noble; for the second best, Alexander Hay; the Keith prize, for the best work of a student in this year's Exhibition, Duddingston Herdman and William Fraser, equal; Maclaine Watters medal and extra prize, W. Milne; the Stuart prize, G. Denholm Armour.

Sheffield Society of Architects and Surveyors.—The inaugural meeting of the newly-formed Sheffield Society of Architects and Surveyors was held on Tuesday evening at the Montgomery Hall, and was a very successful gathering. More than fifty Fellows and Associates were present. The walls of the hall were hung with oil and water-colour drawings, engravings, and photographs, lent by members of the society, and most of them possessing interest from an architectural point of view. In the ante-room were a number of oil and water-colour drawings, amongst them a pair of charming water-colours, by Dodgson—one of "London Fog," and the other "A Rainy Day in Spring," which were lent by the president, together with a view of "Chichester Cathedral." Drawings were lent by Mr. J. B. Mitchell-Withers, Mr. C. Hadfield, Mr. Fred Fowler, vice-president, and Mr. E. Holmes. The president, Mr. T. J. Flockton, delivered an address, in which he said that when, at the suggestion of Mr. Hadfield and Mr. Mitchell-Withers, he called a meeting to consider the formation of the society, he hardly expected that at their first meeting they would have as many as 73 members and associates. He went on to consider what were the objects of the society, and how they were to be attained. The objects were the advancement of the profession, promoting and facilitating the acquisition of knowledge in the various arts and sciences connected therewith, the education of the junior members, and the consideration of questions of professional practice. These

objects it was hoped to attain by social, friendly, and unrestrained intercourse at meetings like the present and the friendly discussion of matters affecting the profession, by monthly meetings, for the hearing of papers and lectures, with discussions; by the formation of classes among the associates and students in the subjects of design, construction, the history of architecture, &c.; by assisting in the preparation of candidates for examination by the leading societies; by communication and exchange of opinion with the Royal Institute of British Architects, the Surveyors' Institute, and other kindred societies, and the receipt of their papers, and by the ultimate formation of a library. Mr. C. Hadfield proposed, Mr. Mitchell-Withers seconded, and Mr. R. Davidson supported, a vote of thanks to the president for his address, which was cordially adopted. The secretary announced that the library of the school of art (the use of the council room at which they had secured for their meetings) would be open to members for reference every Tuesday evening during the session from 7 to 9. He also read the syllabus of meetings, pointing out that the council had given the important question of Registration the first consideration. Papers would be read on Dec. 13th by Mr. J. Wreghitt Connon, F.R.I.B.A., on "Registration." Jan. 10th, 1888, Mr. J. Murgatroyd, F.R.I.B.A., on "The Value of 'Association' and 'Federation.'" Feb. 14th, Mr. C. Hadfield, F.R.I.B.A., on "Interest in Architectural Design," and March 10th, Professor T. Roger Smith, F.R.I.B.A. (of London University) on "Architectural Education."

THE SURVEYORS' INSTITUTION.—The twentieth session of this Institution was opened on Monday evening with an address from the president, Mr. W. J. Beadel, M.P. After congratulating the members on the growth of the Institution during the twenty years since its establishment—the number on the roll being now between 1,300 and 1,400—the president reviewed the vast public improvements effected during the last half-century (in all of which the surveyor had borne an important part), illustrating this by the fact that in 1837 the total capital invested in railways was forty-three and a half millions, whereas the capital now invested exceeds eight hundred millions. The surveyor during these fifty years had also been extensively employed in connection with the commutation of tithes, the enclosure of commons, and in the purchase or sale of every description of landed and house property, as well as in public improvements, such as the freeing of the metropolitan bridges, the acquisition of Epping Forest, Finsbury Park, Burnham Beeches, and other open spaces, and in the rating of every description of property throughout the country. After quoting figures to show the enormous increase of the value of land and house property in London, he proceeded to contrast it with the deterioration in the value of agricultural land in recent years. The president reminded many of the profession that after three years from the present date no surveyor can join the Institution without passing the examinations imposed by the Charter of Incorporation, and that some progress has already been made in this direction, 345 candidates having already passed these examinations in the voluntary form, the members by examination now representing 15 per cent. of the whole professional membership of the Institution.

The Marquis of Breadalbane unveiled at Aberfeldy, Perthshire, on Saturday, a memorial cairn erected in recognition of the services of the 42nd Highlanders (Black Watch). The memorial rises to a height of 30ft., and is surmounted by a statue, 10ft. high, of a soldier in the original costume of the Black Watch, while beneath, on the chief front, is a life-sized figure in the present costume of the 42nd Regiment, inscribing on the pedestal the names of the battles which the regiment bear on their colours. Mr. W. Birnie Rhind, of Edinburgh, was the sculptor of the memorial, which was illustrated in the BUILDING NEWS for June 24 of the present year.

Messrs. Campbell, Smith, and Co., who decorated the Lyceum Theatre, have been intrusted with the whole of the decorative work at the Empire Palace, which is to be of the most gorgeous description, and is being done under the superintendence of Messrs. Romaine Walker and Tanner, architects, who designed the decoration of the Gaiety Theatre some years ago.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

THE "BUILDING NEWS" DESIGNING CLUB. (In reply to numerous inquirers, we cannot undertake to send the rules of the club by post, or to answer individual inquiries. The rules were published in the "B. N." of Nov. 4, and intending competitors must get that number.)

Correspondence.

SEVILLE CATHEDRAL.

To the Editor of the BUILDING NEWS.

SIR,—It is a somewhat hard task to reply to Mr. Carpenter's letter published in your last issue in reference to my drawing of the above. I cannot understand—well, so *clever* (?), yet so ungenerous and in many cases untruthful, an attack on my work. Mr. Carpenter has unfairly assumed to suit his own purpose all that he has written about.

I am fully aware that by permitting a drawing to be published in the BUILDING NEWS I am calling forth criticism from all quarters of the profession, and must accept them, both kind and cruel; therefore, I cannot quarrel with Mr. Carpenter for finding fault with my style of delineation as not being consistent with his own (whatever it may be). *Unfortunately*, we are not all such clever draughtsmen as Mr. Carpenter.

I must, however, now apologise to your readers for inflicting a view so *unrepresentative*, according to Mr. Carpenter's idea, of so architecturally beautiful an interior. My only excuse must be that I supposed it might interest those unacquainted with it. I may in all fairness add I do not think it misleading in any sense; yet I do not ask you to accept it as doing justice to such noble work, or even giving an idea of its magnificence, as I have seen it; I would leave this to clever men.

Mr. Carpenter next states that my drawing is "an *adaptation* (we will not say a *copy*)" of Laurent's photograph. This statement I deny *in toto*. I have never seen (to my knowledge) a photograph showing this exact view, though there are several very similar. I did once possess a woodcut (unfortunately I have mislaid or lost it) which may have been taken from the photograph referred to. Mr. Carpenter also states that my view is exactly the same size as Laurent's photograph. This is untrue. Laurent's photos. measure 13¼in. by 10in., the BUILDING NEWS plate 15in. by 10½in., whereas my drawing is 18in. by 12½in.

With reference to sketching in the cathedral I fortunately spent some time in Seville studying and making drawings of its many charming buildings. I made some half-dozen sketches in the cathedral, of which this is one; it is true it was never finished even in pencil, and I had to make the best of it afterwards by the help of a print and photographs. My drawing was made about five years ago, and at that time I had never heard of any rule to prevent sketching in the building, nor was I ever interfered with.

The side chapel referred to as being a blank wall was at the time of my visit just as it is shown, being undergoing restoration and stripped of all embellishments.

I think, Sir, I have answered all the accusations of Mr. Carpenter that may be necessary from my point; the rest of his letter may be treated with contempt, composed as it is of ungenerous and sarcastic statements, which I accept as criticisms and suggestions, and for which I thank him and shall endeavour in my *next work* to act upon.

I feel highly flattered that so great an authority *and critic* as Mr. Carpenter should have given so much valuable time in writing so long and severe a letter on the work of one of the younger members of our noble profession who, at the time the drawing was made, was simply a student who worked for the love of the thing, and did his best to produce honest work in his own style.—I am, &c.,

GILBERT S. DOUGHTY.

14, Fletcher Gate, Nottingham, Nov. 9.

SWINDON INFECTIOUS HOSPITAL COMPETITION.

SIR,—A dozen tenders have been received by the Swindon Local Board for carrying out the selected design for the above.

The most stringent condition in this competition was that the cost should not exceed £1,300. The highest tender received was £3,311, and the lowest £2,351.

It would be interesting to watch the surgical operation necessary to fit this design within the limits of the competition, and if, when so mutilated, the design be then adopted, would this be fair and just to the other competitors, who thought that the conditions laid down were really intended to be adhered to?

In common fairness, is there any need for hesitation as to what course should be taken by those who issued the instructions?—I am, &c.,

A NON-COMPETITOR.

THE FUTURE OF THE ARCHITECT, AND "THE ARCHITECT OF THE FUTURE."

SIR,—"M. M.," in your issue of the 4th inst., has imagined, as many others have, that in speaking of works carried out by the builder without the aid of an architect, I referred to "small repairs and alterations." It will surprise them, perhaps, to learn that I am speaking of works (within my knowledge) ranging from £4,000 to £100,000! The writer of "Wayside Notes," in your last issue, has also misapprehended the tenor of my remarks. I know very many builders—very respectable men they are—and certainly I do not blame them for getting rid of their (in many instances) bugbears, in the shape of architects; but I blame the architect for permitting such a state of things to be possible; I blame him for allowing "fine-art architect" to be construed into "pretty sketchist and no more." I blame him for allowing specialists of all kinds—specialists in construction, specialists in decoration, and, lastly, specialists in sanitation, to ease him of his proper functions, and, in course of time, as the latter has, and as the former will, ease him altogether of his *raison d'être*. The architect should, even if he avails himself of the specialist, be his master, and not allow the positions to be reversed. I

know we are all human, and I know how nice it is to be thus helped in our work without any corresponding reduction of pay; but depend upon it, Sir, the architect of the future will suffer for all this.

Mr. Charles R. Guy Hall, in speaking in last week's BUILDING NEWS upon "Professors of Sanitation," said that the "principles of house sanitation or drainage are both few and simple." He is perfectly correct, and I hope his words will be well borne in mind by young architects, and perhaps old architects, who have allowed the cant of the "sanitary expert" to frighten them away from a part of their legitimate business.

A few days' work at "sanitation," as it is called, will enable any ordinarily cultivated young man to grasp and to master all that is involved in the many lectures of the "Professor," who, for purposes easily understood, wraps up in mystery that which is as clear as daylight.

I hope that Mr. Arthur Cates, and those who are working with him in the cause of technical education, will impress upon every candidate the necessity of mastering this easy branch of their business. Let every young architect make himself thoroughly independent of every expert who now trenches so closely upon his heels. We shall then hear less of these intruders. The public will gradually recognise that the architect is complete *master of the works*, and then perhaps the future of the architect will not be quite so gloomy as I have ventured to predict.—I am, &c.,

7, Duke-street, Adelphi, WM. WOODWARD.
Nov. 15.

AN OBSCURE ARCHITECTURAL RELIC IN DONCASTER.

SIR,—It may not be known to the majority of your readers, as it was only revealed to me by accident, although a frequent visitor to Doncaster, that an architectural relic of considerable interest exists in this old sporting centre.

Mr. John Elinis, merchant, of Doncaster, is the owner of some property on the east side of French Gate, the back of which abuts on the ground of St. George's Church, one of the most successful works of the late Sir Gilbert Scott, R.A. The front portion of this property is a plain three-story residence erected in the last century; but the rear portion is much older, and is evidently a remnant of some important building that formerly occupied the site of the street frontage. This old property is a low two-storied building of massy stone walls; the windows are square-headed, with moulded oak frames and mullions, which afford the only architectural character of the exterior. The ground floor is converted into four cottage dwellings, two only of which have chambers on the first floor, one at least of which has an old moulded ceiling in plaster arranged in a geometrical design. The greater part of the first floor consists of what in old times was considered a large or grand room, now used as the church mission room. Here is a very fine plaster ceiling of geometric design, enriched with the Tudor rose, the *fleur de lis*, and quaint ornaments. The centrepiece is a coat of arms, the emblazonment of which is perfect, although, like the rest of the work coated with generations of whitewash. A fine cornice, with enriched frieze and brackets, runs along the north side and the east end. That of the south side has fallen into decay, whilst that of the west end has been destroyed by the building of a wall, which has encroached about 2ft. upon the old ceiling.

The whole of the work is bold and massive, and although one which might reasonably be called Elizabethan, bears evidence of an earlier date—viz., that of King Henry VIII. In the rear of this building are other stone erections of considerable age, said to be part of the old priory of Doncaster. These have also been converted into cottages, and underneath the adjoining southern block of property is said to be a cellar or crypt of considerable interest.

The position of this fine old room strongly implies that it has been part of a domestic building of considerable importance converted from, or erected on the site of, the old priory, and the arms preserved are no doubt those of the first lay owner after the property had passed out of the hands of the Crown, into which it would fall upon the suppression of the lesser monasteries.

I have no doubt something is known of this fine example of old work in real architectural circles, and that it is mentioned in the history of the town; but, nevertheless, it is not so generally known as it deserves to be. Being a work well worth visiting, and one within easy access of artists on sketching tours, I may be excused for furnishing this hurried note thereon.—I am, &c.,

Scarborough, Nov. 14. W. STEVENSON.

SANITARY ASSOCIATIONS AND HOUSE DRAINAGE.

SIR,—House drainage is a question in which I have for many years taken much interest, though I must own that I carefully eschew any connection with patents, and, further, I consider a patentee a dangerous person to employ, as he naturally leans to his own nostrum, even though in his heart of hearts he may know it is not the best. I had some experience of this when inspecting some large house drainage works carried out by Mr. Roger Field, C.E., where his patent trap was, in my opinion, used in season and out of season.

Many years ago Mr. Norman Shaw commenced a crusade against the system of traps which Mr. Buchan advocates and Mr. Roger Field practises, and I would advise their followers to refer to his reasons, as published in your paper, for adopting only one disconnecting-trap at the connection to main drain or cesspool, and also to carefully consider the contents of the paper recently read at Bolton by Mr. Honeyman, of Glasgow.

My objection to sanitary associations has hitherto been on account of their inspectors advising what I consider useless and worse than useless, disconnecting traps and ventilating or "blow-off" pipes, dividing the drains up into what Mr. Buchan calls the "sectional system," and at the same time overlooking structural defects; for in one instance I found one of these inspectors had passed a "bell trap" to a sink as sufficient trap between the drain and the basement of a large block of offices. I am therefore delighted that they are waking up to the knowledge that traps are, after all, merely a means of collecting solid matter, which, as Mr. Norman Shaw stated, gives out sewer gas as soon as the flushing drain ceases through the house being unoccupied. This "sectional system" appears to me to be a makeshift to patch up badly laid drains, and often costs more than remodelling, at the expense of the risk from bringing sewer gas close to the house, and depending on traps and ventilating pipes alone to prevent it doing mischief. In my opinion the objections to the system are: 1st, that it prevents thorough and proper cleansing of the drains by water and passing rods and brushes through, and, on the other hand, forms so many obstructions which hold a certain amount of solid matter, and might therefore be termed a continuous series of cesspits.

2nd. It prevents thorough flushing of the drains with air, and I am willing to follow Mr. Norman Shaw, Mr. Honeyman, and many others in believing that flushing with air is the way to render drains harmless as well as without smell. I also fancy everyone who has had experience in trusting to traps keeping out gas when there is a pressure of air upon the water seal will agree with me that they are useless; and it is also a question with me as to whether the gas cannot be absorbed by and conveyed through the water seal. Recently, when using the peppermint test, the smell clearly travelled through a good lead trap, and the last time I adopted the trapped or "sectional" system, the trap next the cesspool—a Buchan's—was forced by the pressure of air from the overflow, which passed up the drain as if nothing interposed.

In conclusion, I would point out that in his letter in your issue of the 28th October, Mr. Buchan does not say anything respecting "Clerk of the Works'" proposal to adopt the vicious practice of ventilating the drains by means of rainwater-pipes; vicious because when there is heavy rain there is a down instead of an up current, and in frosty weather the ventilator becomes closed with ice. This once very common practice has caused the sacrifice of many valuable lives, and I am surprised to see it suggested by one who professes to have had experience in sanitary work.—I am, &c.,

JOHN W. ALEXANDER,
Diocesan Surveyor for York,
Middlesbrough, Nov. 9.

THE FIRE AT WAYGOOD'S.

SIR,—As many of our friends have understood from the account in Saturday's papers of the fire which occurred here on Friday evening last, that the whole of our premises have been destroyed, we have much pleasure in informing you that the injury was confined to our carpenters' and pattern makers' shops. The main portions of our factory, including our machine shops, lift-fitting shops, and general offices, are practically unhurt, and though we may have to ask the indulgence of our friends for a slight delay in executing orders, as our drawing office has been injured by fire and water, we have made arrangements to accommodate the departments affected, and shall be able to resume work as usual in a day or two.—We are, &c.,

R. WAYGOOD AND CO.
Falmouth-road, Great Dover-street,
London, S.E., Nov. 14.

Intercommunication.

QUESTIONS.

[9463.]—**Leaky Bath.**—I have lately had a bath built of glazed enamelled bricks set in cement and grouted about 1in. at back of bricks, also in cement; bottom of bath is laid with enamelled tiles; bath leaks very much. Could someone inform me what material it would be best to point brickwork with? Would white-lead putty be good? At present the pointing is of Parian cement, which is falling out.—B. P. G.

[9464.]—**Tiles in First Floor.**—What is the best method of laying tiles on the first floor of a building? Is there any objection to laying them on top of wood floors, and if so, how can the difficulty be overcome?—CONSTRUCTION.

[9465.]—**Drawn Lead Piping.**—Some time back I saw an account of some manufacturer of lead piping having succeeded in perfecting a machine for turning out drawn lead piping, circular inside and square outside. Can any reader give me information on the subject?—C. B. YOUNG.

[9466.]—**Early Churches.**—Can anyone inform me whether plans of Kempley Church, Gloucestershire, and Adel Church, Yorkshire, have been published? I shall be glad to know of any instances of aisles before the 12th century.—STUDENT.

[9467.]—**Stone Beams.**—Mr. Lawrence Harvey's illustration of the strength of stone used as beams is borne out by all laminated structures of wood, in which the beams or ribs are composed of vertical laminæ or boards. Brick beams are made with bricks and vertical slices or "flitches" of the bituminous rock composition, which add immensely to their strength. The principle is certainly one that ought to be remembered in introducing stone lintels. I should like to hear of any samples.—G. H. G.

[9468.]—**Whitewash.**—Would any reader kindly give me a recipe for removing whitewash from outside stone walls?—EXON.

[9469.]—**Fink and Bollman Trusses.**—Will any reader explain these forms of trusses, and how the stresses are obtained. Which is the best introduction to these questions?—HYPO.

[9470.]—**Gas-Lighting for Draughtsmen.**—I find the ordinary flickering gas-burners ruinous to the eyesight in drawing. Can anyone inform me how I can obtain a good steady light? I believe there are oil and gas-lamps that can be used. If so, I should be thankful to obtain information, and I am sure half those who have to work late on drawings will be glad, too.—DRAUGHTSMAN.

[9471.]—**Music Hall.**—I will feel much obliged by one or more of your correspondents kindly informing me as to where I can get detailed information or particulars regarding the construction of a high-class music-hall or concert-room capable of accommodating 2,500 persons. Particulars of any architectural works specially treating of the construction of such buildings would also be gladly received.—CARMEN.

[9472.]—**Commissions.**—Is there any well-founded reason why an architect should not pay commission to a gentleman introducing a client who brings good work, the said client being totally unknown to the architect prior to such introduction, and the gentleman introducing him having no other interest in the transaction except as a friend of the client? Would it be a breach of professional etiquette to pay such commission? Sensible argument for or against such a course would probably be of service to many a—YOUNG ARCHITECT.

[We should hardly think this question worth inserting, but for some ugly facts within our own knowledge. Some architects nowadays even take commission on advertisements inserted on behalf of their clients.—ED. B.N.]

REPLIES.

[9443.]—**Perpendicular Style.**—The "Perpendicular" is the name for that phase of English Gothic which was in vogue from the close of the 14th century until the 16th century. It is peculiarly English, and its more notable features are the depressed and four-centred arches, fan-vaulting, transomed windows, with panelled tracery, wide and shallow mouldings, and other distinctions too numerous to particularise here. Of the "architects" (I believe the name architect was not used until Elizabeth's reign) who flourished at this period may be

mentioned William Colchester, master mason at Westminster Abbey; Richard de Cracall, who contracted to build Catterick Church, Yorkshire; William Horwode; William Orcheyerd, Jennings or Jeynings, master mason at St. George's Chapel, Windsor; Norton, who restored St. Mary's, Redcliff, after the fall of the spire in 1446; John Dryell, surveyor of All Souls', Oxford; Roger Keyes, Richard Beauchamp, John Kendall, John Ashfield, Reginald Ely, and John Wubrich, surveyors of King's College Chapel, at Cambridge. The names of William of Wykeham, John of Wheathamsted at St. Alban's, and others are too well known to need further mention. Of the buildings in this style in and near London, "City Pupil" will find much to interest him in the churches of Great St. Helen's, Bishopsgate-street; All Hallow's, Barking (near the Tower); St. Olave's, Hart-street; St. Margaret's, Westminster, rebuilt in modern times; the beautiful choir of St. Saviour's, Southwark, the reredos of which is "Perpendicular"; the parish church of Chiswick, restored by J. L. Pearson, R.A.; Beddington Church, Surrey; and the parish church of Croydon, which was rebuilt after the fire in 1867 by Sir Gilbert Scott. The details of the nave of Westminster Abbey are "Perpendicular," though the general design of the earlier portion has been followed throughout. There is also some good work remaining in the parish churches of Enfield and Edmonton, and as late specimens of the Style none are so fine as the chapels of Henry VII. at Westminster; St. George's, Windsor; and of King's College, at Cambridge. Of secular buildings, the halls of Westminster, Guildhall, Eltham, Hampton Court, and the palaces of Croydon and Lambeth, the library roof of which was remodelled by Sir C. Wren on the old lines, are fine examples. There is also some interesting work at the Charter House and the hall of the Merchant Taylors' Company. At a greater distance from London than those I have named, the splendid churches of Norfolk, Suffolk, and Essex form a complete series, and the university towns of Oxford and Cambridge are full of most interesting examples.—A. C. W.

[9450.]—**Masonry and Stonecutting.**—I am very pleased to see, by the discussions to which the published text of my first lesson has given rise, that the subject of my lessons interests the readers of the BUILDING NEWS. In answer to the strictures of Mr. John Powell, I beg to say that the word "voussoir" is as English as extrados and intrados; it is used in Gwilt's "Encyclopædia," and in Dobson's "Rudimentary Treatise of Masonry and Stonecutting." The words "voussoir" and "arch stone" are not equivalents: voussoir applies to the stones which form the surface of any vault, whatever its shape may be; whereas arch stone applies only to arches. I am glad that Mr. Powell has mentioned his objections to some parts of my lesson, and will be thankful for all criticisms, suggestions, and observations, which will enable me to perfect my text. As it occurs, the method objected to by Mr. Powell is the one taught at the Ecole des Beaux Arts, whereas the other one, which Mr. Powell approves, is my own. At all events, whatever the deficiencies of the published text of my lessons may be, they do not in the least affect the efficiency of my lessons at the Guilds Institute. There, all the elaborate explanations required in a text-book fall away, for I simply explain the processes of stonecutting by *practically* working one stone in the presence of four or five pupils, who in their turn teach the others. This is how I have managed last winter to make twenty-eight members of the Architectural Association produce, in seven lessons, models of raking walls, straight arches, penetrations of vaults, and cupolas; which must appear to those who know anything about scientific masonry a very remarkable feat.—LAWRENCE HARVEY, Teacher of Scientific Masonry, City and Guilds of London Institute.

[9456.]—**Crushing Weight of Stone.**—Average crushing load:—Portland, 4,000lb. per square inch; Bramley Fall, 6,050lb. per square inch; York, 5,700lb. per square inch; Aberdeen granite, 10,900lb. per square inch; Cornish granite, 6,300lb. per square inch (Molesworth).—NO SIG.

[9456.]—**Crushing Weight of Stones.**—According to the South Kensington "Notes on Building Construction" the crushing weight for various stones is as follows:—

	Crushing weight per square inch in tons.	Size of cube. in. in.
Portland	1·66	2 × 1
"	2·03	1½ × 1
"	1·5	2 × 1
"	1·17	1 × 1
"	1·74	2 × 1
Bramley Fall	2·7	1½ × 1
"	2·5	1 × 1
York (paving)	2·56	1½ × 1
"	4·38	2 × 1
Bath (Box)	0·66	2 × 1
"	0·54	1 × 1
Aberdeen } Granite (blue) }	4·87	1½ × 1
	3·47	1 × 1
Cornish granite	2·84	1½ × 1

—A. C. W.

[9456.]—**Crushing Weight of Stones.**—Consult Hurst's handbook or any treatise on materials.—G. H. G.

[9459.]—**Concrete Roofs.**—A roof of 3in. thick of Portland cement concrete made of 1 of cement, 4 broken brick ballast (inch mesh), and well beaten, may be used. The concrete should be covered with the best asphalte.—G. H. G.

[9461.]—**Picture and Chimney.**—A piece of felt placed over the chimney breast behind the picture.—G. H. G.

[9462.]—**Stopping Wood Joints.**—I should say a mixture of sawdust and glue would be the best stopping for a wood-block floor, though another and better patented composition is used—that used in the wood-block paving of Lowe.—G. H. G.

A new Conservative Club in Cannon-street, Louth, was formally opened on Tuesday week. It has been built from designs by Mr. James Fowler, F.R.I.B.A., the ex-mayor of the town, and the contractors were Messrs. Harrison Brothers and Messrs. Clarke and Son.

Our Office Table.

IT will be remembered that, at a special meeting of the Hellenic Society, held at Burlington House on July 2nd, 1886, for the purpose of discussing the antiquity of the remains discovered by Dr. Schliemann at Tiryns and Mycenæ, Mr. F. C. Penrose referred to several features of the masonry of the palace at Tiryns and the tombs of Mycenæ, which seemed to him during an inspection in the previous April to militate against the prehistoric character of all but the outer walls of Tiryns. Among these were the small size of many of the stones, the marks of saw-cuts and of tubular metal drills, and the interspersion of kiln-burnt bricks. In reply, Dr. Schliemann stated that similar features were to be found in the undoubtedly early ruins on the islands of Hæra and Samos, and in Cephalonia, Eleusis, Orchomenos, and the Acropolis at Athens. Dr. Dörpfeld urged that similar treatment of walls was to be seen at Troy and in Egypt, and challenged Mr. Penrose to visit the sites in his company, when he would undertake to dispel by examination all doubts as to the age. Mr. Penrose has accepted this invitation, and as a result of a late visit to these cities with Dr. Dörpfeld, concedes all the points in dispute. All the suspicious features are, he says, capable of explanation, and, both at Tiryns and Mycenæ, the parallel antiquity of Dr. Schliemann's discoveries and the great Pelasgic works is established. This conclusively disposes of Dr. Stilman's wonderful theory of the Byzantine character of Dr. Schliemann's finds.

MESSRS. BEMROSE AND SONS, of Derby, have patented an Indian-ink stand for the use of architects and draughtsmen. The chief advantages claimed for the invention are that by its use the ink is not exposed to the air, as necessarily is the case when cabinet saucers and ink-slabs are in use, and that, therefore, a saving of time, trouble, and material is effected in not having so frequently to prepare fresh supplies of ink. The ink certainly is kept free from dust, and the stand is exempt from the danger of spoiling a drawing by being upset. In experience, one knows that freshly-made Indian ink is less liable to run, and that stale ink, however good the article may be, always runs more or less when washed over with colour, especially if gall be mixed with it. No liquid ink yet introduced is practically as useful to the architect as good stick ink, nor flows so freely from the pen. Some are indelible enough, and answer well for cloth tracings and details where thick lines are necessary, but for ordinary plans first-rate Chinese stick ink has no equal. It must, however, be used fresh, and from a perfectly clean stand. One difficulty which the "Climax" inkstand presents is due to the likelihood of its not being thoroughly cleansed, especially round the washer or indiarubber sucker in the upper part of the vessel. Another objection is the necessity of using both hands every time a dip of ink is required, one to press down the "nozzle" to cause the ink to rise, and one to hold the pen. The metal surface of the dipping well would soon spoil the pen if the "nozzle" were forced down by pressing the pen into it. A considerable quantity of ink also has to be mixed, or the stand will not properly work. If the bottom of the reservoir were dished towards the centre so as to bring the ink, however small its quantity, towards the mouth of the sucker, this would be obviated. The invention, notwithstanding, is clever, and the article is admirably made in gunmetal, steel bronzed.

THE Council of the Society of Arts has awarded the following among other medals for papers read during the last session:—To William P. Marshall, for his paper on "Railway Brakes"; to Dr. Percy Frankland, for his paper on "The Living Organisms of the Air: the Effect of Place and Climate on their Prevalence"; to A. Reckenzaun, for his paper on "Electric Locomotion"; to Mrs. Ernest Hart, for her paper on "Cottage Industries in Ireland"; to T. Armstrong, for his paper on "The Present Condition of Applied Art in England, and the Education of the Art Workman"; to J. Starkie Gardner, for his paper on "Wrought Ironwork"; to Walter Crane, for his paper on "The Importance of Applied Arts, and their Relation to Common Life"; and to Allan Ransome, for his paper on "Colonial Woods."

LORD MAGHERAMORNE was on Friday re-elected Chairman of the Metropolitan Board of Works for the eighteenth year. In reviewing the work of the board for the past year, he mentioned that the purification of the sewage, the construction of the Blackwall tunnel, and other works in hand were progressing satisfactorily. With regard to open spaces, the number of acres under the charge of the board in 1886 was 1,000, in 1887 it was 2,456, and next year he hoped, with the addition of Parliament-hill, it would be 2,774. At the same meeting the board finally disposed of the case of Mr. T. J. Robertson, of the Superintending Architect's Department, who was censured in July for improper conduct in connection with the sale of the site of the Pavilion to Mr. Villiers. A motion to discharge him was defeated by twenty-two to nineteen. A resolution endorsing and repeating the censure of July was carried by a large majority.

THE Hamburg *Börsen Zeitung*, in discussing the question frequently raised of late, whether the present upward movement in the price of Portland cement in Germany is transient, or whether the prospect for the ensuing year is favourable, says:—"Significant indications are given by the result of the public competition which took place in Posen on the 2nd of this month for the large quantity of 85,000 normal tons. This cement was ordered for use on the Royal fortifications, and is deliverable in the period from now to June, 1889. The tenders submitted by ten manufacturers are, on the average, after allowing for transport charges, 13 per cent. higher than those of June 2 obtained by the same department for 18,000 normal tons. Especially significant is the fact that the lowest tenders of November 2 are about 23 per cent. above the lowest of June 2."

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Building and Decorative Stones of Egypt," by W. Brindley, F.R.M.S. 8 p.m.
Royal Academy. Lecture No. 3 on "Anatomy," by J. Marshall, F.R.S.

TUESDAY.—Institution of Civil Engineers. "Accidents in Mines," by Sir F. A. Abel, F.R.S. 8 p.m.
Glasgow Architectural Association. "The Monastic Orders and Buildings of Scotland," by G. Washington Browne, of Edinburgh.

WEDNESDAY.—Society of Arts. "The Mercurial Air-Pump," by Prof. S. P. Thompson. 8 p.m.

THURSDAY.—Royal Academy. Lecture No. 4, on "Anatomy," by J. Marshall, F.R.S. 8 p.m.

LEGAL INTELLIGENCE.

IN RE CHARLES GRIBBLE.—The bankrupt who had traded at Vauxhall-cross, South Lambeth-road, as an importer of doors, mouldings, and trellis work, applied to Mr. Registrar B. Brougham on Thursday, the 11th inst., for an order of discharge. The receiving order was made on June 9 last, the liabilities amounting to £5,153, and the trustee reported on November 5 that the assets had realised £2,299. The bankrupt was formerly manager to Messrs. Esdaile and Co., timber merchants, to whom the business previously belonged, and on February 1, 1882, having no capital of his own, he agreed to purchase the stock in trade for £2,811. Esdaile and Co. continued to supply him with goods, against which, and the purchase money, they drew bills, resulting in a claim against the estate by the trustee of Esdaile and Co., who failed in January last, for £2,364. The bankrupt stated that Mr. A. W. Peaty, a member of the firm of Esdaile and Co., joined him in partnership, bringing in £1,000, upon which he was to receive interest and two-thirds of the profits. The bankrupt attributed his failure to that of Esdaile and Co., who were his largest creditors, and who were under agreement to renew bills. The Official Receiver reported that the bankrupt had kept proper books, and that he was not aware of any evidence tending to establish any statutory offence. Mr. Registrar Brougham granted an immediate order of discharge.

The east window of All Saints' Church, Blackburn, has just been filled with stained glass. The window is in the Decorated style, and the subject illustrated is Rev. v. 9. The artist is Mr. Swaine Bourne, of Birmingham, who has also just executed a four-light window for Christ Church, Blackburn.

Mr. Holl's portrait of Mr. John Bright was formally hung on Friday in the gallery of the Reform Club at the top of the staircase.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1716.
FRIDAY, NOVEMBER 25, 1887.

SURVEYORS TO LOCAL AUTHORITIES AND THEIR PERQUISITES.

A CASE of considerable moment to the profession, those especially who hold surveyorships under corporations and improvement commissioners, has just been decided before Mr. Justice Mathew and a special jury. It was an action brought by a ratepayer of Ramsgate, Mr. Whitely, to recover the sum of £500 by way of penalties from the defendant, Mr. Barley, borough surveyor, who, it was alleged was liable for certain breaches of the provisions of the Public Health Act, 1875. He pleaded not guilty, and denied the allegations that he had received payments in respect of various contracts other than salary or allowances. The defendant had been appointed surveyor by the Improvement Commissioners of Ramsgate, under the Public Health Act, at a salary of £200 a year, increasing £20 a year till a maximum of £300 was reached. The Borough, incorporated by charter in 1884, still continued the defendant as surveyor. The plaintiff's allegations were briefly these: That the surveyor in his capacity became "concerned and interested" in various contracts made with the local authorities for the purpose of carrying out the Public Health Act provisions; that he had exacted and accepted certain fees and rewards in connection with various contracts for the improvement of the streets and roads, and in connection with the drainage scheme of the town. Under the first class, a large number of contracts had been entered into involving considerable expenditure. The surveyor was distinctly charged with having made an arrangement with the Corporation to carry out the different schemes and prepare quantities, and in his capacity as surveyor had exacted and accepted 2½ per cent. on every contract for streets, and a commission of £750 upon the drainage improvement, in addition to 1½ per cent. upon the quantities therein. The plaintiff based his case upon section 193 of the Public Health Act, which runs: "Officers or servants appointed or employed under this Act by the local authority shall not be concerned or interested in any bargain or contract made with such authority for any of the purposes of this Act. . . . If any such officer is so concerned, or under colour of his office accepts or exacts any fee or reward whatsoever other than his proper salary or wages or allowances, he shall be incapable for ever afterwards of holding any office, &c, under this Act, and shall forfeit the sum of £50 for each offence, &c." After evidence was called, Mr. Finlay, for the defendant, submitted there was no case established, as the defendant had in this case openly received the extra allowances from his town council. They had arranged that the surveyor was to receive 5 per cent. upon a part of the drainage scheme and 3½ per cent. upon the remainder. The surveyor had received upon the cost £780, out of which he had to pay disbursements, leaving him about £400. The 1½ per cent. for the quantities had to be repaid, less expenses, out of pocket. The arrangement, it was contended, was for convenience in accounts, as in the case of private improvement contracts the surveyor had been rewarded for his extra work and labour 2½ per cent. upon the quantities, he paying disbursements. There was no formal resolution of the council in respect of the 1½ per cent. commission upon the quantities in the drainage contract, but there was a formal resolution passed that the defendant was to receive on that scheme £750, less disbursements, for which he was thereby made liable, and this was affirmed by the town clerk, the late Mayor of Ramsgate, and several other gentlemen connected with the local authority. The question for the jury was whether the arrangement as to the payment of 1½ per cent. had ever been made as described. Upon this point the jury found a verdict for the plaintiff. In giving judgment, Mr. Justice Mathew regretted the action was brought to recover penalties under the Public Health Act. He referred to the three contracts entered into by the corporation with certain builders for the improvement of the roads and streets, in each of which contracts it was provided that the surveyor was to be paid 2½ per on the amount. His Lordship ruled in the first place that, under the 193rd section of the Act, the defendant was "concerned and interested," and had incurred the penalties of the statute. With respect to the special resolution of the corporation that the defendant was to be paid certain percentages on the sums expended for the drainage not to exceed £750, besides a commission of 1½ per cent. for quantities, he held that the defendant incurred penalties. There was no evidence, he said, nor any suggestion that the defendant had been guilty of discreditable or dishonourable conduct in his office of borough surveyor. In respect of the drainage scheme he had received a moderate remuneration for very valuable and arduous work. The defendant would seem to have been the victim of a law which in this case had operated hardly. He gave judgment for the plaintiff for £200 with costs. The intimation of the defendant's counsel was that the case would be taken to the Court of Appeal. These are the facts as reported.

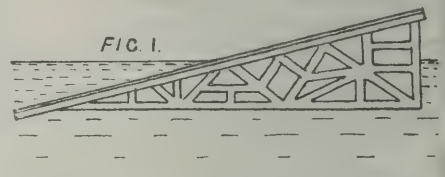
This judgment strikes a serious blow at a system of increasing the regular emoluments of a borough surveyor in a somewhat doubtful manner, which will probably have a wholesome effect. The Judge, in his last sentence, has summed up the facts of the present case in saying that the defendant would seem to have been the victim of a law which in this case had operated hardly. Mr. Barley, we may also say, has acted in a manner by no means unusual amongst surveyors, and it would be easy to bring instances of officials receiving far greater salaries who have for years been making large emoluments from work thrown in their way. Nevertheless, on broad and public grounds, the exaction of and acceptance by those holding public office of fees and rewards is censurable. Those occupying official posts and receiving lucrative salaries have clearly no right to increase their gains by taking commissions from builders and contractors upon works over which they have the control, and the system which permits the official of a public authority to do so must be regarded as wholly wrong. The system, for example, which makes it possible for a surveyor to enter into an arrangement with the corporation who engages him as a salaried surveyor to exact percentages upon contracts between them and third parties must be pernicious. Yet it is one that still prevails. In this instance there was actually a resolution of the corporation to pay their surveyor certain percentages for making specifications and plans, and supervising the drainage work, amounting in all to £750. Mr. Barley was acting in apparently good faith. The duties entailed by such work was, as Mr. Finlay, Q.C., pointed out, in excess of a surveyor's usual and ordinary duties. A municipal surveyor is generally paid for extra work he undertakes, and often receives special remuneration for so doing. The regular salary of a surveyor is supposed to cover usual and ordinary duties, but all new works, as so much increased labour, have to be paid for. Suppose any additional work like a drainage scheme was undertaken by an independent engineer. Of course, his services would have to be paid for at a proportionately large rate, and the ratepayers would not be the gainers. This was one of the arguments used by the defendant's counsel. Again, bills of quantities have to be prepared, if not by the surveyor, by some other practitioner. All these are facts that must be admitted; but there is another way of looking at them. The public are concerned only in having the works efficiently and economically carried out; but, say they, if the local surveyor is engaged to look after the work, how can he do so conscientiously if on each contract it is provided that he is to be paid 2½ per cent. upon the amount to be paid to the contractor on receiving the surveyor's certificate? If he is paid for quantities by percentage upon the amount of contract, what is there to prevent that amount being increased, as it is clearly in the interest of the quantity surveyor that the amount he is paid on should be large? There is, at least, cause for alarm. Better it would be to vote the surveyor certain sums of money as remuneration for these works, quite independent of contracts or the contractors. The 193rd section of the Public Health Act, which we have quoted above, is so decisive on the point that it is almost surprising the local authorities placed their surveyor in so untenable a position by making any such arrangement. In short the verdict is a decisive expression of opinion on the doubtful expediency of a borough surveyor accepting fees from contractors for work which ought properly to be paid for by the authorities, either by increase of salary or by a sum agreed upon.

STREET FORMATION AND ANCIENT LIGHTS.

A VERY important question has been referred to the Works Committee of the Metropolitan Board of Works on the motion of Mr. Edwin Lawrence, the object of which is that the Board be empowered when forming new streets to provide that all ancient lights and other easements interfered with by the new buildings erected shall be dealt with by compensation and not by injunction. The question is one that we foresaw some time ago when the new thoroughfares in the north and west of the metropolis were being made. A person walking through any of the newly-formed streets must have noticed on one or both sides a ragged fringe of partially-demolished ruinous premises cut through by the new road. Charing Cross-road on the eastern side presents large blocks of properties so bisected with the ominous words "Ancient lights" painted on boards and placed outside every window. These announcements are, of course, protests against new buildings being erected abutting upon these windows in the rear, which would at all interfere with the light thereto. The owners of these old and often dilapidated properties have rights or easements of light which they have enjoyed from time immemorial, and they have the power to impose any terms they like upon intending builders, or to restrain them by injunction from building. Mr. Lawrence, in bringing forward this motion, has said what others know from experience—namely, that the existing law enables the owners of these old premises to levy blackmail, and to impose a severe hardship on those who have acquired land for building some important structure. One case he mentioned is on the face of it a disgraceful instance of this monopoly. A public building was contemplated on one of the new sites. The ground was bounded by a wall 11ft. or 12ft. high in the rear, and a few feet from this

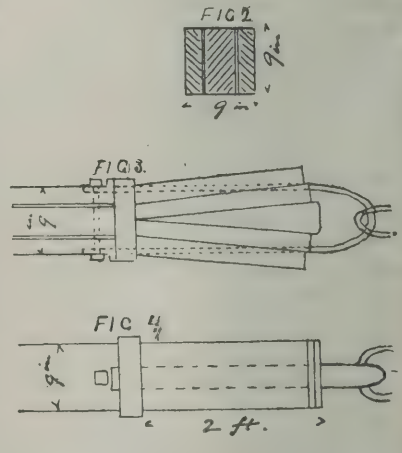
wall was a small, old wooden "building," so constructed, in the first place, on wheels, to evade the Building Act, but which had for over twenty years remained, and had, therefore, acquired the right of light to a small window in it. The owner of this little "shanty" doubtfully acquired was able, through professional advice, to restrain the trustees of the new building, and although the injunction was dismissed, the trustees lost £1,000. Certainly an iniquitous instance of putting the law into operation; but we know of other equally mischievous hindrances which the existing law allows any owner of old property to place in the way of improvements. This is not, however, the worst evil. The ease and readiness with which the law can be put into motion has induced, it is to be feared, unprincipled persons to speculate on this kind of business, to acquire old premises abutting on new thoroughfares, and to make money out of the transaction. Exorbitant compensations are asked for, or impediments are thrown in the way of builders of new premises. Such impositions have frightened away many would-be occupiers of plots in new roads. Extraordinary difficulties have now to be overcome by anyone who purchases a vacant site bounded by old premises having ancient lights. Not only is there the threatening injunction, but the plans of the new building have to be so cunningly devised as to keep clear of litigious neighbours. The Vice-Chancellors have the matter in their hands, and take care to issue injunctions whenever they can. Of recent years the granting of injunctions has been more common than formerly, and any litigious owner who wishes to obtain compensation can prevent building upon land that would improve the neighbourhood. The law, in short, prevents a man from building on his own land and practically deprives him of making the best use of it. But not long ago the easement was regarded as a hindrance to improvement, and the dicta of Judges were rather in favour of not allowing vexatious objections to interfere with the erection of buildings.

It is very difficult to apply a rule that shall be universally held, as buildings are variously situated and are used for different purposes. The statutory law in the Metropolis has prescribed that the width of every new street must be at least equal to the height of every building above the level of the street, the effect of which is that a new building cannot be erected to a greater elevation than that which makes an angle of 45°, and allows 45° of sky to remain unobstructed. But this rule does not apply to the case of back areas. In this case the law regards only the extent of the obstruction or whether there will be a substantial deprivation of the light enjoyed; but the difficulty is to find out what the amount of obscuration really is. In estimating damages there are several things to be regarded: whether the loss of daylight is injurious to those working in the premises; whether it would make them too dark to work in during the winter, thus necessitating the use of gas; the particular trade or business affected; whether the abstraction of light renders the premises unhealthful for occupation; how far the injury to dominant owner may be diminished by the use of white glazed bricks or tiles in the new building. What amount of diminution of light will be considered sufficient to grant an injunction is a matter left to the evidence of surveyors and others engaged in such cases. "Substantial damages" must be proved to obtain an injunction, Mr. Justice Fry once said; not every impediment to the access of light will warrant the interference of the Court, says another; the onus of proving an injury rests upon the plaintiff. Yet these opinions, sound as they appear, do not prevent frivolous objections being made by owners of old premises, prompted as they are by professional advisers who wish to make a little gain by the transaction.



In the Metropolis there are reasons why a clearer enunciation of the law should be laid down; the areas dealt with are small, and therefore there is more probability that the buildings erected will be injurious. But the grievance is that anyone who owns an old tenement may prevent another party from building, by obtaining an interlocutory injunction to restrain the threatened injury. It is true the Courts require proof of the damage likely to be inflicted, and in some cases money damages are substituted for an injunction. Under Earl Cairns's Act (1858) the Court of Chancery have power to award damages to the party injured; these are given in settlement of the matter, or are equivalent to a purchase of the easement. But this sort of settlement does not satisfy the individuals who like the injunction the best. One of the circumstances which render the hardship the greater is that those who apply for injunctions have scarcely any windows worth speaking of to protect. On the other hand, the owner of the servient property may intend to build, or has already built, premises of great value and importance. The principle of the law does not favour the servient owner. For the window in question may be very small, but it can be enlarged to any extent without enabling the servient owner to prevent such act. Nor does it matter whether the window only lights a storeroom or closet, which is never used, the right is one of property.

Building owners on plots of ground so situated are, however, often in fault themselves for not consulting those who have an interest in the rear. After an injunction is applied for there is no retracing one's steps, or making any modification in the plans. Such a course would practically be a new case; the plaintiff would be entitled to the injunction on the original plan, and the defendant would be the loser. The building owner often treats the matter with a high hand, refuses to listen to the dominant owner's suggestions, or to alter his plans in any way. The consequence of this obstinate resistance is often an injunction with costs. Interim injunctions may be often saved if the building owner came to the possessor of the easement, and explained to him what was intended, and asked whether any alteration could be made before the building commenced. Some arrangement at this juncture is often conciliatory; but once granted, the building owner is on his "mettle," and generally refuses to work amicably. The interim injunction is a valuable safeguard, as it prevents greater cost, and often the pulling down of a building when it is far advanced; the Courts, as a rule, not caring for the latter alternative. It can, however, as we have said, be made a very vexatious means of stopping really important works on statements and affidavits not founded on the facts, and upon an imperfect opinion formed from the plans of the new building. In the Metropolitan thoroughfares, where plots not filled can become a public nuisance, the law ought certainly to give the Metropolitan Board of Works authority to provide for all ancient lights by way of compensation instead of by injunction. Why should the owner of a small and dilapidated store in his back premises be enabled to prevent the completion of a new street by demanding a sum of money entirely disproportioned to the value of such light? If the Board were invested with powers to assess the value of such light both parties would be fairly dealt with. We believe the risk entertained by the exacting demands made by owners of old premises has very materially injured the letting of land abutting on old houses. The public are, of course, the sufferers in one sense; but those who have business premises near vacant gaps left by demolished houses have a very strong ground for complaint when they see a few property owners demanding damages that practically close the neighbourhood against enterprising men, and postpone the completion of a thoroughfare to an indefinite period.



WORKS IN WATER.—XXXV.

OF THE MOORINGS OF FLOATING BREAKWATERS.

THE easy movement of a floating structure with a round bottom, such as that shown in the last article on this subject, would offer, perhaps, too little resistance to oncoming waves. It is an essential point in floating breakwaters that they give way in some degree to the waves, and do not offer a rigid resistance to them, as a solid breakwater of ordinary form does. At the same time it is necessary to consider that some resistance is requisite, though it be of a nature such as to act after rather than at the moment of being struck—a yielding resistance, as it is called. In the diagram, Fig. 1, the inner

side, or side next the protected water in the harbour, is vertical, and descends 12ft. into the water. The bottom is flat and horizontal, and the whole structure, instead of turning as it were on a centre, sinks vertically by the pressure brought to bear upon it, and so presents to the waves a stiff and unyielding barrier, thus obliging the crests of the waves to ascend the platform and be broken into spray. To effect this object the base of the caisson in Captain Sleigh's breakwater was extended in the manner shown, the lines indicating only the essential parts of the structure. The inclination of the platform was reduced from 24° to 12° in one instance, and from 30° to 15° in another, and the breakwater was to be moored both on the sea side and the harbour side, to Mitchell's screws, or, as it was preferred, to anchors

with one arm only, the other arm of an ordinary anchor being cut off, but not so close to the shank, the stump of iron being left for the attachment of a second hold on the ground by a similar anchor where the nature of the ground required it; but on a rocky bottom a hole was to be blown out, the anchor laid in, and filled up with stone. An endless chain would be passed through the ring of the anchor, so that by hauling it round it could be examined without disturb-

ing the moorings. It was considered of great importance to preserve an elasticity in the movements of the breakwater, or floating barrier, and to this end, and to ease the drag on the moorings, heavy weights were to be suspended at intervals along the mooring chains, and in that case a considerable power would be required to straighten the chain before any dead pull could come upon the anchors. The mooring chains proposed by Admiral Tayler were in long links of flat bars of iron placed between 12ft. lengths of timber. There were to be two plates in each length, as in Fig. 2. These were buoyed up and also stiffened laterally by pieces placed between and on each side of them, the centre piece 9in. × 4½in., and each side piece 9in. × 2½in., so that when put together they formed a beam 9in. square, 12ft. long. Beside the iron plates, a longitudinal strain was put upon the fibres of the wood. At each end of the centre piece of timber three saw-cuts were put down to a depth of 2ft., and the ends were wedged out 2in. each way, making the end 13in. by 9in. A strong iron hoop was put on at a distance of 2ft. from each end, being put on as hot as the timber would bear without injury, so that on the cooling of the hoops the fibres of the timber would be compressed there. A bridle strap of flat bar iron passed round the end, and took hold of the ends of the plates by means of a pin passing through them, and a shoulder upon each end of the strap took hold of the iron hoop at the root of the wedged-out end of the timber, the strain which came upon the hoop through the bridle being transferred to the fibres of the timber—or, at least, that was the intention ; but it may be pointed out that both these means of resisting the strain could not act fully together at the same time, for the bolt-hole through the plates would be, of course, no larger than was required for the pin to pass through them, and the strain would first come upon the plates. It would not be until these had been overstrained that any stress would be put upon the fibres of the timber, which would act only as a safeguard to prevent the immediate parting of the chain on the giving way of the iron plates ; but the strength of the timber would not act in conjunction with that of the plates, so as to increase their strength. Nor would the strength of the plates increase that of the timber, as was supposed. Too much importance was laid upon the tensile strength of the timber by Admiral Tayler, who said that straight-grained timber would bear a much greater strain in tension than an equal weight of iron, and that he proposed for that reason to form his mooring-chains chiefly of timber. He omitted to observe the proper reason for combining the two materials, which is that one strengthens the other by stiffening it against lateral pressures, which would interfere with the due exercise of its strength longitudinally. But there is in the use of timber another and separate duty, so far as its lesser specific gravity goes, in reducing the weight of the mooring-chains carried by the floating breakwater, the buoyancy of which is liable to some reduction on this account.

The question of mooring a floating breakwater will be found to be a very important one, especially of the form proposed by Captain Sleigh, or that of Admiral Tayler, and Mr. G. W. Lenox, one of the greatest authorities on this question, was of opinion that a floating breakwater might be perfectly secured in any ground, by suiting the anchor to the ground, even in that which was considered generally bad holding ground, if sufficient time and opportunity were given to decide upon what would be the best mode for any particular ground ; and if anchors were properly arranged with regard to the body which they have to hold, they would work their way into the ground until they become secure. As to the chains which are usually attached to anchors, he was, perhaps, more conversant with them than anybody else in the kingdom was, having made anchors and moorings for all the navies in the world, and worked for our navy for very many years. He had no doubt at all that he could construct chains for such moorings and anchors as were required for floating breakwaters, which could not be pulled away by any floating body.

His late partner, Sir Samuel Brown, who was a captain in the navy, had a project of this kind, and he constantly consulted with Mr. Lenox about it, and Admiral Tayler also consulted and arranged with the firm of Brown, Lenox, and Co., about his moorings ; and he had never seen a structure, either in substance or as represented to him by plans, which he could not hold securely against weather. With regard to the question whether a number of small chains, making up the same weight per fathom as one heavy chain, was any the stronger, he said they were, undoubtedly, provided that the pull could be brought upon all the chains at once. The greatest difficulty in the making of iron was in compressing the fibre : the larger the diameter the more difficulty there was to compress the fibre ; consequently, the centre of a large bolt was much weaker than the centre of a small one, per inch of its sectional area. Then, another advantage of small chains was that they were more easily repaired ; more easily handled. He would give the breakwaters a permanent mooring, and, in addition, he would have a similar set rather larger and rather longer, so that in case of a structure breaking the first mooring or chain, the second would immediately come into action ; but, in the meantime, it would lie a little slack. With regard to the time a chain would last under water on our coast, it depended, in a great measure, upon the water it was in : if there was any copper near it, as of a sunken vessel which had been coppered, a bolt would be much reduced in size in a short time. On the South coast—in the Channel—it would remain for four or five years without much deterioration ; there would be a large incrustation ; that would be knocked off, and the iron would remain pretty much the same—perhaps reduced in a small degree. With regard to the part of the chain which would be subject to the greatest deterioration in any given time, it was not, as was sometimes supposed, where it was washed, near the surface of the water, or "between wind and water," as it was termed ; the greatest friction would be on the lift of the chain, and the perpetual rise and fall ; there was an agitation there which would deteriorate the iron by friction, and materially reduce its size. It would also depend upon the character of the bottom very much ; but, as a general principle, the moorings of all floating breakwaters should not remain more than two or three years without a general inspection ; indeed, there would be no difficulty in inspecting them every year. The system was so well understood by divers and others that they could tell, by certain signs, whether there was any material alteration, and if there was anything serious a diver could go down and detach the shackle, and the chain could be taken up ; and, in the mean time, the floating structure could be held in its place without difficulty. The cost of these proceedings, with cables and anchors, was not sufficiently understood by people in general ; it constituted but a very small portion of the cost of any structure as a whole.

Admiral Tayler's breakwater, as we mentioned in a former article, was tried on an experimental scale at Brighton ; the structure broke from its moorings, or rather one of three sections did so. Admiral Tayler undertook with the Brighton Pier Company to lay down three sections of his breakwater, each about 60ft. in length, and they were to remain there under an agreement for four winter months, exposed to all gales. The moorings were supplied to him from one of the dockyards, and when they were taken thence to Brighton it was found that no proper shackles had been supplied with them ; but as it was necessary, in order to prepare for the next sitting of Parliament, that the work should be proceeded with at once, the master attendant of the dockyard advised a temporary plan, which was adopted, and when the breakwater had ridden out five months instead of the four agreed upon, application was made to the Pier Company for payment, which, however, they could not grant without permission of the Loan Commissioners, of whom they had borrowed £10,000 wherewith to construct the pier. It was then decided that the three sections of breakwater might remain where they were, to see how long they would last, and they remained, apparently without attention of any kind, for 14 months, during all gales. A company was subsequently formed, and two fishing boats were sent out to cast them loose, and they were placed upon the shore to show that they would lie upon the beach exposed to the breakers without injury ; and they remained on Brighton beach for two years, until they were taken to pieces. Nevertheless, in consequence of one of the small chains being broken before it could be properly attached to the mooring, one of the sections did break adrift, but not in a gale of wind, and when it was found to be adrift, two boats were sent out for it, and it was brought on to the beach. When Mr. Lenox was subsequently examined, he said of this trial at Brighton that he was acquainted with it, and that it was badly carried out, because it was hurriedly made and with a great anxiety to show what could be done. The cause of the giving way was that the pins of the shackles—which ought never to have been trusted to—shook out. Accidents of that sort, however, only arise when the moorings are affected by agitation or friction, as when pins are put through shackles, they should be solidly clenched. Formerly, ships got adrift from the Admiralty moorings, and there was a great outcry about it. The Admiralty Department consulted Mr. Lenox, and he devised a most simple plan, which made the connection quite perfect ; he dovetailed a chamfer on the top of the head of the pin, upon the eye of the shackle, and put in a pellet of lead, and by striking the lead with a hammer it dispersed itself, and could not be removed until driven out with a punch ; but that plan was not adopted in the case of the trial of Admiral Tayler's breakwater at Brighton. The shackle bolts would no doubt all be looked at in an annual or bi-annual inspection, and so there would be some safeguard, but it is better to have a clenched bolt ; the iron would in that case break before it would come away.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second meeting of the Institute was held on Monday night, the President, Mr. Edward I'Anson, in the chair.

Mr. McVicar Anderson, hon. sec., announced that they had received from the City Corporation, through Mr. Andrew Murray, a chromolithograph of the new Tower Bridge, the last work of their former President, Sir Horace Jones, and from Mr. R. Phené Spiers, a copy of his newly-published work on "Architectural Drawing."

Mr. Charles Fowler stated that Mr. Thomas Blashill, superintending architect to the Metropolitan Board of Works, had, at his suggestion, presented the Institute Library with copies in duplicate of that Board's regulations.

Mr. C. J. Phipps, F.S.A. : The regulations are very illusory. As soon as one has complied with the requirements, the Board of Works Committee turns round, and wants others met.

The books will be perfectly useless to any architect. (Laughter.)

The PRESIDENT called attention to the fact that the British School of Archæology at Athens invited students to visit that city for a period of four months, the only requirement being that they should be willing to assist in works of excavation. The British School were prepared to contribute the sum of £50 towards the expenses of one student, and that Institute would provide the selected candidate with a second £50. Applications should be sent in before Tuesday, Dec. 10, and particulars would be sent to all intending to enter.

Mr. ANDERSON said he must make a correction to the President's announcement. That Institute had not provided £50 for the selected student, for, unfortunately, their funds did not permit of such a step being taken; but their President had generously done so out of his own pocket—an explanation received with loud applause.

THE BUILDING AND DECORATIVE STONES OF EGYPT.

A paper on this subject was read by Mr. WILLIAM BRINDLEY, F.R.M.S., and was illustrated by numerous specimens of sandstones, granites, marbles, and porphyries, by water-colour sketches, and a relief model of the mountains near the west coast of the Red Sea, by some 200 large photographs of Egyptian buildings and scenery, and by full-scale coloured drawings of mosaic pavements. The limestone which was employed for building the Pyramids and in the temples and other buildings of Thebes was of extremely fine and hard character, and in that climate retained tool marks uninjured for centuries. He exhibited specimens removed from the Great Pyramid at Gizeh, and carved scarabs, and also examples of the Roman period, which were in an excellent state of preservation. Another excellent material was a sandstone of warm grey colour and fine texture. The chief quarries were about 90 miles south of Thebes; they were on either side of the Nile, and formed indeed a shelf or bed beneath the river. The material was worked in large masses, and was floated down the Nile on rafts to the towns where required for building purposes. These sandstone blocks were usually built without mortar, and the upper and inner surfaces were faced with a thin coat of stucco, and the same method was adopted in Roman days. The igneous formations were met with in a range of mountains along the western coast of the Red Sea, a spur running inland to the west, and crossing the Nile at the First Cataract near the ancient Syene, now Assouan. The granites were of many colours and varieties—red, grey, and blackish grey, and owing to the intense heat and absence of rain had been disintegrated on the surface. This face decay must have been going on for many centuries, for the lecturer found that many of the rock faces had been cut down in early times, through the rotten material, into sunk panels, on which were sculptured subjects. The surfaces of the great obelisk at Luxor, and of the sphinx and most other examples of Egyptian granites were peeling off, and the same process could be seen to have commenced in the colossal arm now in the British Museum. At Syene (Assouan) the immense Roman quarries could still be seen in rows, side by side, separated only by masses of *debris*. In one of these was an unfinished and only partially-detached block, measuring 95ft. by 11ft. It was generally called an obelisk, but the proportions did not agree, and the transverse shelves upon it showed it had been intended to cut the immense mass up into short lengths for sarcophagi. Having referred to the granite quarries of Mons Claudianas, Mr. Brindley described the ancient quarries of porphyry worked by the Romans, and to its use in Rome and Constantinople. The true imperial porphyry was, he added, a reddish purple stone of considerable hardness, susceptible of a high polish, and composed of a silicious paste in which were set white and pink crystals of feldspar. Under the Cæsars it was regarded as the most valuable building material the Roman Empire could produce, and it had continued so till the present day. Examples of its use might be seen in the sanctuary pavement of Westminster Abbey, and in the tomb of Henry III. in the same building, and at Durham Cathedral, while there were two columns in the British Museum, and other specimens at South Kensington, besides some in private collections. Pliny and other ancient writers only vaguely stated that the porphyry quarries were in Egypt, and for many ages they had been completely lost. The Roman quarries were actually rediscovered by Burton and Sir Gardner Wilkinson in 1823, and were visited by Lepsius in 1845, but no one of these travellers brought away specimens or took any notes as to the porphyry remaining. Mr. Brindley then described his re-examination of the quarries at Gebel Duchan in February of the present year, of which a full account was given in his paper* read before the British Association at Manchester in August last. He added that the method of extracting the porphyry must have been by metal wedges and not with wooden ones swollen by water or by diamond drills, as was often asserted. Indeed, he saw wedge holes in the vertical faces of the rock where it would have been impossible to have applied water to swell the wood even if water had not been so costly in such an arid and elevated situation. As for the supposed use of jewels for drills, Mr. Freeman had sent him up from Cornwall specimens of granite worked in the usual English manner, with coarse emery-powder tubes, which were precisely similar in working to examples he had brought from Egypt, and which could be compared side by side on the table. In conclusion, the author described some of the marble mosaics to be found in the mosques and Coptic churches of Cairo.

Mr. ALFRED WATERHOUSE, R.A., moved a vote of thanks to Mr. Brindley for his introductory paper, and which had been rendered the more valuable by the sketches, photographs, and specimens by which it had been illustrated. He had always thought that porphyry was to other building materials what the diamond was to other gems, but hitherto it had been out of reach of architects. He should have liked to have learned more about the rediscovered quarries, and how they were to be exploited for the use of this and succeeding generations.

Professor G. AITCHISON, A.R.A., seconded the vote of thanks. He concurred with Mr. Waterhouse that porphyry was a truly imperial material, and he was much afraid that even when Mr. Brindley's quarries were in full working order porphyry would not be cheap, on account of the difficulties of transport and the excessive hardness of the material. For a plain table top, a slab of porphyry, 7ft. by 3ft., he had paid £30, hardly representing the cost of sawing and shaping; but a usual price for pavement material was about £5 per foot super., and ½in. in thickness. The *opus Alexandrinum* mosaic derived its name, not from the town of Alexandria, but from the Emperor Alexander Severus, who made large use of this form of decoration. Many of the Egyptian marbles, granites, and porphyries were magnificent materials for decorative purposes, and the porphyry had this advantage for pavements, that it was only polished by the hardest traffic. The illustrations of mosaic pavements, inlaid with mother-of-pearl, reminded him of his visit to a mosque near Cairo, where he performed one of the few good actions of his life. He was looking over a mosque just outside Cairo, which had been left in the care of only one man, who offered to cut down for him large portions of the mosaic decorations from the interior walls, suggesting that if he did not have them the Khedive would probably give them to some Frenchmen. He declined to avail himself of the tempting offer, on the ground that an architect ought not to be the first to dismantle a historical building.

Mr. R. PHENE SPIERS, F.S.A., said that he, on the other hand, was instrumental in the mutilation of a mosque in the same city, for having persisted in going to the roof of a mosque to sketch, he found on a third visit that this had been rendered impracticable, the custodians having demolished the stone staircase. One of the most interesting points referred to by Mr. Brindley was the extraordinary preservation of building materials in the dry climate of Egypt. He was surprised to hear the disintegration of granite ascribed to the action of the sun, and thought this must be a mistake, and that the stone which was so decayed must have formerly been within reach of the rising of the Nile. Where the stone retained its dryness, as on the Temple on the Island of Philæ, modern inscriptions like those of Lepsius were no more distinct and clearly cut than those done in the days of the Cæsars, or the still earlier Egyptian hieroglyphics. The Egyptian serpentine was a very different material from the English stone known by the same name, and also from the green serpentine found in Sparta. The style of all the mosques in Cairo and its neighbourhood he believed to be based on the one at Kirwan, which had been referred to by Mr. Brindley.

Mr. TOPLER, of the Royal School of Mines having referred to Mr. Brindley's splendid and enormous collection of marbles from all parts of the world at his works in Westminster Bridge-road, remarked that the action of heat in disintegrating rocks did not seem to be generally understood. In this climate building-stones were destroyed by the intermittent action of water, which carried into the pores carbonic acid and other deleterious substances, and also broke up stone by mechanical action, by expansion during frost. In Egypt, however, the sun's heat was the only cause of the decay of the rocks, as the expansion during the day was followed by contraction at night, and the alternations caused the stone to become fissured. So violent was this action that the cracking sound could be distinctly heard, and microscopical examination of the mud of the Delta showed that it differed from other alluvial deposits in the presence of comminuted angular particles broken off the rocks which had not travelled far enough to assume the ordinary rounded forms. Mr. Brindley's theory was, therefore, fully corroborated. No member had alluded to the fact that among the twelve hundred columns in the Mosque of Cordova, pillars collected from all parts of the Mediterranean coasts, were two of purple porphry, rediscovered by Mr. Brindley.

Mr. T. GRAHAM JACKSON, F.S.A., felt that Mr. Brindley was entitled to all credit for having rediscovered the imperial porphyry; but it remained to be seen whether it would come into use again. He feared that it might not be found in large enough quantities to be of practical use, which would be a matter for regret, from its high value in mosaics. If such a hard and beautiful material could be brought within the reach of people of ordinary means, it would be a great advantage.

Mr. FREEMAN, of Penryn, confirmed Mr. Brindley's view as to the mode used by the Egyptians for splitting the granite and porphyry, adding that it would be interesting to know the means adopted by them for detaching the large masses of such very intractable material as porphyry, and the means of transport. By his firm's new process for sawing such materials, work which until recently would occupy two days, could be effected in two days, and the expense and delay was proportionately reduced.

Mr. BRINDLEY, in acknowledging the vote of thanks, said the biographies and inscriptions showed that the ancient mode of transport of porphyry from the quarries and the river, or Red Sea, was by oxen. These quarries at Gebel Duchan were one hundred miles from the Nile at Keneh, by the old Roman route across the desert, but only 22 miles from the port of Myos Hormos, on the Red Sea. He was having the country surveyed, and believed there was an easy gradient down to the latter port. He hoped to be able to supply porphyry in London, delivered viâ Myos Hormos and the Suez Canal, for about £3 per foot cube in place of the £8 per foot cube, the price at which he had been purchasing the material till recently. He was not, as he had explained, the discoverer of these quarries, as Sir Gardner Wilkinson found them in 1823, and Lepsius more than twenty years later, and more recently, unknown to him until his return from Myos Hormos, Schweinfurth had surveyed the district, but they had not made any practical use of their discoveries.

ARCHITECTURAL ASSOCIATION.

THE third fortnightly meeting for the present session was held in the R.I.B.A. room on Friday evening, the President, Mr. J. Slater, B.A., in the chair. The following 18 new members were elected:—Messrs. S. H. White, A. Huddart, F. W. Dorman, J. S. Stuart, W. W. Kenworthy, E. Thornton, R. J. B. Proctor, F. W. Bedford, F. W. Shenton, H. Tooley, W. J. Roberts, W. B. Clarkson, E. Box, C. T. Lofts, S. P. Silcock, Hayling, P. Leeds, and E. P. Howard.—Mr. T. E. PEYCE, hon. sec., read a letter from Mr. H. E. Freeman, secretary to the Architectural Union Company, stating that the directors of that company had made a donation of 20 guineas from their surplus fund to the Association library, to be expended on books for the lending department. On the motion of Mr. Burrell, librarian, seconded by Mr. H. W. Pratt, a vote of thanks was passed to the Architectural Union Company for their liberal gift.

The PRESIDENT said he had received a letter from Mr. Banister Fletcher, Warden of the Carpenters' Company, stating that any member of the Association, properly accredited, would be welcome to the use of the reference library of books on building and carpentry lately formed by that company at their hall in London-wall, E.C., and could borrow works from the lending branch on the deposit of 5s., which sum would be returned when the book was brought back. He hoped members would largely avail themselves of this kind offer, and believed that it would be of great practical use.

A. A. CYCLING CLUB.

Mr. F. R. FARROW, hon. sec., announced that on Tuesday, the 15th inst., a meeting of the cycling members of the Architectural Association was held at 9, Conduit-street, W., when a resolution was passed to the effect that it was desirable to form a club, to be called the "A. A. Cycling Club," having for its object the combination of architecture and athletics by instituting cycle runs to places of architectural interest. It was further resolved that the subscriptions to the club be merely nominal. The following were elected as officers:—Captain, Herbert D. Appleton; committee, J. C. Agutter, J. G. W. Buss, F. R. Farrow, B. J. Fletcher, O. Fleming, W. D. Gravell, C. O. King, C. J. Shaw, W. F. White, and Chas. W. Winmill; hon. sec., Leonard V. Hunt, 35, Queen Victoria-street, E.C. The meeting was adjourned till Dec. 6th.

OUR SKETCHING-CLUB SCHEME.

Mr. HERBERT D. APPLETON, F.R.I.B.A., vice-president, read a paper explaining his scheme for assisting architectural students in their sketching tours. The method to be adopted is a system of advisers and local representatives to be called consuls and vice-consuls, the titles used for similar officials in the Cyclist Touring Club. He wished that evening to raise a discussion on the question of the desirability of the Association making the proposed club one of its recognised methods of advancing the architectural education of its members. The United Kingdom will be divided into districts, following as much as possible the county boundaries; but in the case of the larger counties, these have again to be divided. A consul will be appointed for each of these divisions, and up to the present the promoters have succeeded in filling up twenty-seven of these, leaving twenty-five divisions to be filled up. They have only succeeded in appointing ten vice-consuls up to the present, and were particularly anxious to appoint as many of these as possible, as on them will fall the chief portion of the work. The exact boundaries of the divisions cannot be defined until the appointments are made. It is not a *sine quâ non* that the consuls should reside in their divisions. The following is a list of the divisions and the appointments made, and vacancies that have to be filled up:—

I.—NORTHERN DIVISION.

1. Northumberland.
2. Cumberland.
3. Durham—C. Hodgson Fowler, M.A., F.S.A., F.R.I.B.A., the College, Durham.
4. Mid York—G. H. Fowler Jones, 8, Lendal, York.
5. East York—John Bilson, A.R.I.B.A., 23, Parliament-street, Hull.
6. West York—J. D. Webster, F.R.I.B.A., 21, Church-street, Sheffield.
7. Lancashire—R. Knill Freeman, F.R.I.B.A., Bolton-le-Moors, Lancashire.

II.—NORTHERN CENTRAL DIVISION.

8. Cheshire—T. M. Lockwood, F.R.I.B.A., Chester.
9. Derbyshire—F. J. Robinson, F.R.I.B.A., Strand-chambers, Derby.
10. Nottingham.
11. Lincoln—James Fowler, J.P., F.R.I.B.A., Louth, Lincolnshire.
12. North Northampton and Rutlandshire—J. A. Gotch, F.R.I.B.A., Kettering.
13. Staffordshire—C. Lynam, F.R.I.B.A., Stoke-on-Trent.
14. Shropshire.
15. Leicester.

III.—EASTERN DIVISION.

16. Norfolk—E. P. Willins, A.R.I.B.A., 6, Bank-place, Norwich.
17. Suffolk.
18. Cambridge—W. M. Fawcett, M.A., F.R.I.B.A., 1, Silver-street, Cambridge.
19. Essex—Fred. Chancellor, F.R.I.B.A., 20, Finsbury-circus, E.C.
20. Huntingdonshire and Bedfordshire.
21. Hertford.
22. Middlesex.

IV.—SOUTHERN CENTRAL DIVISION.

23. Warwickshire—F. B. Osborne, F.R.I.B.A., 13, Bennett's-hill, Birmingham.
24. Worcestershire—Aston Webb, F.R.I.B.A., 19, Queen Anne's-gate, S.W.
25. Herefordshire and Monmouthshire—E. Seward, A.R.I.B.A., Cardiff, South Wales.
26. South Northamptonshire—W. T. Brown, A.R.I.B.A. Wellingborough.
27. Buckinghamshire.
28. Oxfordshire—T. G. Bruton, F.S.A., F.R.I.B.A., 17, New Inn-street, Oxford.

V.—SOUTHERN DIVISION.

29. Gloucestershire.
30. West Kent—E. I. Bennett, F.R.I.B.A., 5, Hammtreet, Gravesend.
31. East Kent—H. Benstead, F.R.I.B.A., 86, Week-street, Maidstone.
32. Surrey—E. Tuke, St. Michael's House, Basinghall-street, E.C.
33. Sussex—L. W. Ridge, F.R.I.B.A., 7, Upper Woburn-place, W.C.
34. Hampshire—C. R. Pink, Castle Hill, Winchester.
36. Wiltshire—C. E. Ponting, Lookeridge, Marlborough.
37. Berkshire.
38. North Somerset.
39. South Somerset.
40. Dorsetshire.
41. North Devon.
42. South Devon—E. A. Appleton, F.R.I.B.A., Torquay, Devon.

VI.—WELSH SECTION.

43. Flint, Denbigh, Carnarvon, Anglesey—A. Baker, 14, Warwick-gardens, Kensington, W.
44. Pembroke, Cardiganshire, Carmarthenshire.—D. E. Thomas, Haverfordwest.

VII.—SCOTTISH DIVISION.

45. South-east Scotland.
46. South-west Scotland.
47. East-central Scotland.
48. West-central Scotland.
49. Northern Scotland.

VIII.—IRISH DIVISION.

50. East Ireland—J. L. Robinson, A.R.H.A., 198, Great Brunswick-street, Dublin.
51. South Ireland.
52. West Ireland.
53. North Ireland.

LIST OF VICE-CONSULS.

6. West York—G. F. Terry, Buckingham Chambers, St. James-street, Sheffield.
11. Lincoln—R. Fowler, Louth, Lincolnshire.
14. Shropshire—W. A. Webb Somerville, Wellington, Salop; J. F. Fogerty, Priors Lee Hall, near Shifnal, Shropshire.
22. Essex—J. W. Lee, North-street, Colchester; H. Saul, Dover House, Fairlod-road-Leytonstone.
29. Gloucestershire—G. W. Sadler, jun., 6, Clarence Parade, Cheltenham.
33. Sussex: Eastbourne Division—N. C. Nisbett, A.R.I.B.A., 20, Oakley-square, W.
36. Wiltshire—C. Adye, Bradford-on-Avon.
42. South Devon—H. E Mallett, 11, Burton-crescent, W.C.
44. Merioneth, &c.—Telpe Smith, Rayden, Radnorshire.
46. Carmarthenshire—H. H. Moses, 55, Lower Cathedral-road, Cardiff.

The promoters are anxious to nominate as many vice-consuls for each division as will come forward. If possible they should be resident in their respective divisions, although a vice-consul living in London who had an intimate acquaintance with some locality in the provinces could render great assistance in connection with the central register. The duties of a consul are chiefly to receive reports of the vice-consuls and check the information supplied by them, and supply information to students who intend making sketching tours in his district. After this information has been checked and corrected, one of the vice-consuls, whose duty it will be to keep the register for the division under the superintendence of the consul, will enter the matter in the register and send a duplicate to the central office in London, where copies of all the reports will be filed. The form of the report should be based on the excellent examples to be found in Mr. E. Sharpe's book on the "Architectural Excursions in Lincolnshire," and to this might be added references to books which contain descriptions or illustrations of the building, a note whether the building has been measured, and, if it has been measured and not illustrated, a reference to the place where the drawing can be seen if possible. We have specially in view, as a first step, the indexing of what has been done in the way of illustrating interesting buildings. Many of the best illustrations are in recent publications, such as our A.A. Sketch Book and other similar books. The professional press contains a wonderful collection of illustrations of old work, and the Transactions of other societies must be carefully searched for information. The work of keeping the mind posted up to date with the vast number of publications will be a great work of itself. It is to be hoped that students will endeavour to measure up work that has not been previously illustrated, and it should be a point of honour with them to supply copies of their drawings to be deposited in the central office. A small collection of measured drawings exists in the library of the Institute, and some of the drawings which obtain the Architectural Union Company's prize are also deposited in the library. We could not do better, therefore, than to add to the collection already begun, and all the measured drawings obtained through the agency of this scheme should be presented to the Institute library, unless this scheme can be further developed, and an imperial collection be formed at the Imperial Institute, when our scheme might furnish the section devoted to the United Kingdom. Already an enormous mass of information exists on the subject, and among the books that must be consulted is W. Upcott's "Bibliographical Account of the Principal Works relating to English Topography," 3 vols., London, 1818, 8vo; R. Gough's "British Topography; or, an Historical Account of what has been done for Illustrating the Topographical Antiquities of Great Britain and Ireland," 2 vols., Ined., 1780, 4to., and M. J. Anderson's "Book of British Topography," a comparatively new book, referring only to books in the British Museum. Mr. E. Sharpe's account of the churches visited in the Lincoln excursions of the Architectural Association, London, 1871, does admirably for a limited number of buildings what we wish to do for the whole of the buildings in the United Kingdom. Among other books of value are "Notes on the Churches of Kent," by the late Sir Stephen Glynne, Bart. (London, 1877, 8vo.); "Hints on the Practical Study of Ecclesiastical Architecture and Antiquities," for the use of the Cambridge Society, 4th edition, 1843; Whewell's "German Churches," 3rd edition, 1842, concerning notes as to vaulting; and the "Ecclesiastical and Architectural Topography of England," (Parkers, 1851), dealing with Oxford, Beds, Huntingdonshire, and Cambridgeshire. In addition to this, in the portfolios of architects all over the country lie innumerable drawings of interesting buildings, and the author appeals to them to send a postcard to him at 157, Wool Exchange, Coleman-street, E.C., if they are willing to place these at the disposal of the scheme. Practically speaking, he added, the great bulk of this information is utterly lost for want of proper indexing, and the question is—how can we make these dry bones live? He thought by some such organisation as he had sketched out much of the valuable work done can be made of living interest, and, in course of time, of great historical importance. Of late years there had been a tendency to substitute sketching for measured drawings; but for a register of this nature, while sketches should not be excluded, efforts should be made to obtain as many measured drawings as possible. Now, when our scheme has got to work, the student who has made up his mind which district he proposes to visit writes to his consul for that division, and receives from him a list of the buildings of architectural interest and notes of the books which refer to the particular buildings and the number of buildings that have been already illustrated. The student is thus able to judge at once of the character of the work he is about to study, and to either read up beforehand the historical or antiquarian information that he may wish to acquire to render his studies complete or to take such books with him as will assist him in his investigations. From his experience, as

secretary to the Annual Excursion of the Architectural Association, the author knows the difficulty there is in finding accurate information about the buildings in particular districts. Even when we have had the assistance of the local architects and the accumulated wisdom of the committee, it has been the custom for some years past for the secretary to go over the ground before the excursion is arranged, and report on the number of good buildings to be found in the neighbourhood of the headquarters proposed. Now, much of this information the private student is quite unable to obtain, and it is to fulfil this purpose that the scheme was mainly started. To the student properly introduced to the consul special facilities for obtaining permission to visit buildings not usually open to the public might be granted, and generally the vice-consuls would act as guide, philosopher, and friend to the tourist; such necessary information as to board and lodging would also be supplied by the vice-consuls, and, possibly, in course of time, we might arrange tariffs like our prototype the C.T.C. The reason why the former attempts to form a register of buildings in the United Kingdom have more or less been failures, seem to be chiefly on account of the want of youthful vitality in the undertakings, those who started them having, in the inevitable course of events, grown old, and passed away, leaving no successors to carry on their work; but we hope to attract to the scheme a constant accession of young blood, so that the work being done by students for students it may, like our Association, always boast of perennial youth and enthusiastic support. Mr. I'Anson, in his presidential address, remarked the most fitting work for the Imperial Institute would be the production of a thorough and complete record—perfect in all its details—of the more important architectural monuments contained in India, and the many historical sites and ruined cities to be found within the various dependencies of Great Britain and Ireland. This has already been accomplished to a slight extent by private enterprise and liberality, but there is no complete or national work of the kind. We might help in this idea by presenting to the Imperial Institute the materials for the sections devoted to the United Kingdom. This scheme is for students worked by students; but if we might be allowed to work for an Imperial scheme as well as benefit ourselves, surely it ought to give an additional impulse to the movement. If of silver and gold architects have none, all can help in placing on record for the Imperial Institute the splendid inheritance which our forefathers have left us. The collection of such a register as Mr. I'Anson foreshadowed would be almost the complete architectural history of all time, and no prouder position could the Association occupy than to do its humble part in helping forward so monumental a work. Again, the value to our colonists of a complete record of all the architectural buildings in the United Kingdom would be almost greater than to ourselves. The value of some such collection is so obvious that surely an appeal has only to be made to the Council of the Imperial Institute for it to be warmly taken up, and he would suggest that as soon as the scheme had succeeded in making some substantial progress, he should offer to place the information collected at the disposal of the Imperial Institute as a foundation for the larger scheme. I simply suggest, said Mr. Appleton in conclusion, this ambitious view of my subject, as its ultimate development for your consideration; but I hope that, should it not meet with approval, it will not prejudice the simpler scheme out of which it has grown. The value of the great index of buildings of architectural interest is hard to exaggerate, and this could be compiled without the illustrations suggested for the larger scheme; but the collection, preservation, and systematic arrangement of carefully-measured drawings of old buildings is well worthy of the consideration of the Architectural Association as affording facilities for the study of civil architecture — the leading object of the Association, as set forth in the rules — and I will conclude by proposing: "That the Sketching Club Scheme be adopted as one of the recognised methods of the Architectural Association, and that the committee be asked to appoint a sub-committee to carry on the work."

Mr. J. A. Gotch, ex-president, said he had very great pleasure in seconding the resolution with which Mr. Appleton had concluded. He approved generally of the scheme, and it was evident that a remarkable step in advance would be made if in the first place a general list could be drawn up of the buildings of architectural interest to students existing in England, although they could not expect to get a complete catalogue for some years. The system of mapping England out into consulships was a good idea, as the consuls being familiar with their own districts, would be able to advise students as to the buildings best worth examination. The compilation of a general list of illustrations of all buildings was a formidable task, and it would be necessary to indicate which were good and which indifferent illustrations. Many were only of historical interest, as showing how badly at some periods people had drawn. In the same manner many buildings would be unworthy of notice.

Mr. F. T. Baggallay moved a vote of thanks to Mr. Appleton for bringing forward his scheme, which was well devised and would supply a want much felt by students.

Mr. Elgood, in seconding the motion, suggested that this movement could be combined with the proposed cycling club.

Mr. Hampden W. Pratt suggested that consuls should forward all information to the proposed sub-committee, who could tabulate the information, and so provide students for a small fee with information as to widely-separate districts and those overlapping several consulships. Such lists should indicate whether or not private houses and other buildings could be inspected, and if so the days and hours at which students were permitted to sketch. He thought the scheme for depositing drawings with the Imperial Institute would have to wait a few years before being developed.

Mr. F. R. Farrow supported the suggestion that all information should be transmitted by consuls to the general sub-committee, and Mr. T. E. Pryce wished to see Mr. Appleton's scheme carried out in its integrity, though it would be difficult to draw the line, as almost all buildings would be of interest to the architectural student. Much of the ordinary work they would probably find had been already done by local archæological societies.

Messrs. S. F. Clarkson, W. Randolph, C. C. Winmill, W. J. H. Leverton, and others took part in the discussion, and the resolution approving of the scheme and a vote of thanks to Mr. Appleton were passed by acclamation.

DINING-ROOMS.

A PAPER on this subject formed one of the contributions to the recent Convention of Architects at Chicago. Mr. Fredericks, the author, dealt with the subject in a practical manner. Taking the dining-table as the dominant centre to which all else must subserve, the author observed that the essentials are light and colour. "The exposure of the dining-room should, where possible, be on the side, avoiding the direct sunlight (especially during summer), and if feasible, should come from only one direction—that is, from windows placed on one side of the room, and if it can be done, from a single opening made sufficiently large and proportionate to the room, either as a single, double, or even triple window to suit the circumstances. The preference for this light should be given to the narrow side of the room. If light from two sides cannot be avoided, let the openings be placed opposite to each other on the narrow sides in preference to two successive sides, but never permit the light to come from more than two sides." Speaking of the colour, the walls are suggested to be of some neutral tint, never a violent or even a light tone, nor dark or showy. Warm tints are to be preferred; blue should be avoided. Warm, reddish tints, of a sombre but rich and tolerably dark tone are recommended because they will not lose their identity in the deepest shadows nor reflect the light, and they form good backgrounds for silver and glassware. For joinery hard wood naturally finished is preferred to dark wood; oak is a favourite wood. Dining rooms should be wainscoted. A panelled wooden ceiling and a hardwood mantel are suggested. Referring to decoration, the author observes that harmony and repose are necessary, and this may be obtained in three ways—by harmony of shades, of contrasts, and of combination. The first depends on one colour, but two or more shades; the second upon two colours—the combination of complementaries; the third upon more than two colours. Regarding picture ornamentation, the class of subjects should avoid the dramatic; the cycle of seasons or months is in harmony with the dining-room—so also are agriculture, the forest, and chase, incidents of domestic life of a cheerful kind. The ideal of such decoration is to be found in the Pompeian walls, with their decorative subjects upon a simple ground. Hanging-pictures by destroying harmony are to be avoided.

ARCHITECTS' ASSISTANTS' PROVIDENT FUND.

A MEETING of architects' assistants was held in the room of the Society of Architects, St. James's Hall, Piccadilly, on Friday evening, to consider the advisability of starting a provident fund. The chair was taken by Mr. Robert Walker, of Cork.

Mr. W. A. Chambers read several letters which had been received in support of the movement from the Architects' Benevolent Society, the Surveyors' Institute, the Society of Civil and Mechanical Engineers, the Glasgow Architectural Association (which offered a yearly subscription of two guineas to the fund), the South of Ireland Society of Architects and Engineers, and others from assistants in various parts of the country, some of which contained valuable suggestions as to the lines upon which the fund should be worked. Mr. Chambers explained that there was a wide difference between the existing Architects' Benevolent Society and the proposed Provident Fund; the former being a charity, while the latter is intended to take the form of a system of insurance. He asked the meeting whether it would be better to work under the auspices of any society, or to be entirely independent, and, speaking for himself, he warmly advocated entire independence and self-support. He gave a general outline of the obligations imposed by the Friendly Societies Acts, and suggested that the proposed society should be registered under them, both for the security of the promoters, and to give assistants confidence in the scheme. After a few words of thanks to the Press for giving prominence to the notice of the meeting, and to the Building News especially, for an article of the 4th inst, he concluded by moving the following resolution:—"That this meeting of assistants considers it advisable that an Assistants' Provident Fund should be established to provide monetary assistance to members in case of sickness, and insurance at death, on the consideration of the payment of a small subscription."

This was seconded by Mr. R. W. Coventry Dick, who advocated the Provident Society being open not only to the assistants of architects, engineers, and surveyors, but to all draughtsmen. He pointed out that men of his own class were more liable to sickness from the alternate confinement in offices and exposure on buildings than were men in most callings, while the risk of accident was also considerable.

Mr. Edgar Farman, in supporting the motion, suggested that the executive should consist of gentlemen drawn from the ranks of assistants themselves, and upon them would depend the ultimate success of the project. The one great principle to observe in framing these rules should be that the association must be self-supporting; he did not mean that it would not be open to receive subscriptions, but it must be framed upon a sound financial basis, independently of any outside aid that might be afforded. The letters that had been read from the various architectural and engineering societies on the subject showed that there was a great feeling of sympathy with the movement, and no doubt directly some scheme has been formulated subscriptions would readily be given to such a deserving object. The proper course would be to appoint a committee from the assistants present at once to draft the rules and call another meeting to consider them. If the association was to be a success the executive

committee must not, in framing the rules, deal with the subject of eligibility to membership in a narrow-minded spirit, for the larger the membership the better for the association and to all its individual members. The right to become a member should be open to any draughtsman's assistant, whether he were assistant to an architect, engineer, surveyor, or any other occupation directly or indirectly akin to architecture. The whole success of the scheme depended upon it being established on a liberal basis.

Mr. L. Sargent raised the question as to where the line should be drawn for admission to membership; and Mr. Ernest Farman drew attention to the Law Clerks' Provident Society as an example of a similar institution to that now proposed to be formed.

Before putting the motion, the Chairman remarked that it would not, if adopted, limit the scope of the proposed society, but would merely establish a principle. He strongly advocated the setting aside of all such crutches as patrons would be, and advised the widening of the base to the utmost possible extent; the movement must for success be a self-supporting one. He expressed great sympathy with it, and said that he considered it a duty of principals to see that their assistants joined; as for himself, he intended to pay the subscriptions for his own assistants. He also advised a graduated scale of subscriptions according to the age and salary received by the members, with a corresponding scale of benefit. The resolution was then carried unanimously.

Other resolutions were afterwards carried appointing Messrs. Brindley, Cattermole, Chambers, Davies, Coventry, Dick, Egan, Jewitt, and Kenny as a provisional committee to draw up a set of rules for the management of the society, and to call a future meeting to consider them, and accepting the offers of Mr. G. A. T. Middleton to act as hon. secretary, and of Messrs. Morse, Hewitt, and Farman to act as hon. solicitors to the committee. Votes of thanks were passed to the Society of Architects for the use of its room, and to the chairman for presiding, the speakers (Messrs. Chambers, Lethaby, Farman, and Walsh) laying great stress on the necessity for independence, as did also Mr. Walker in his reply.

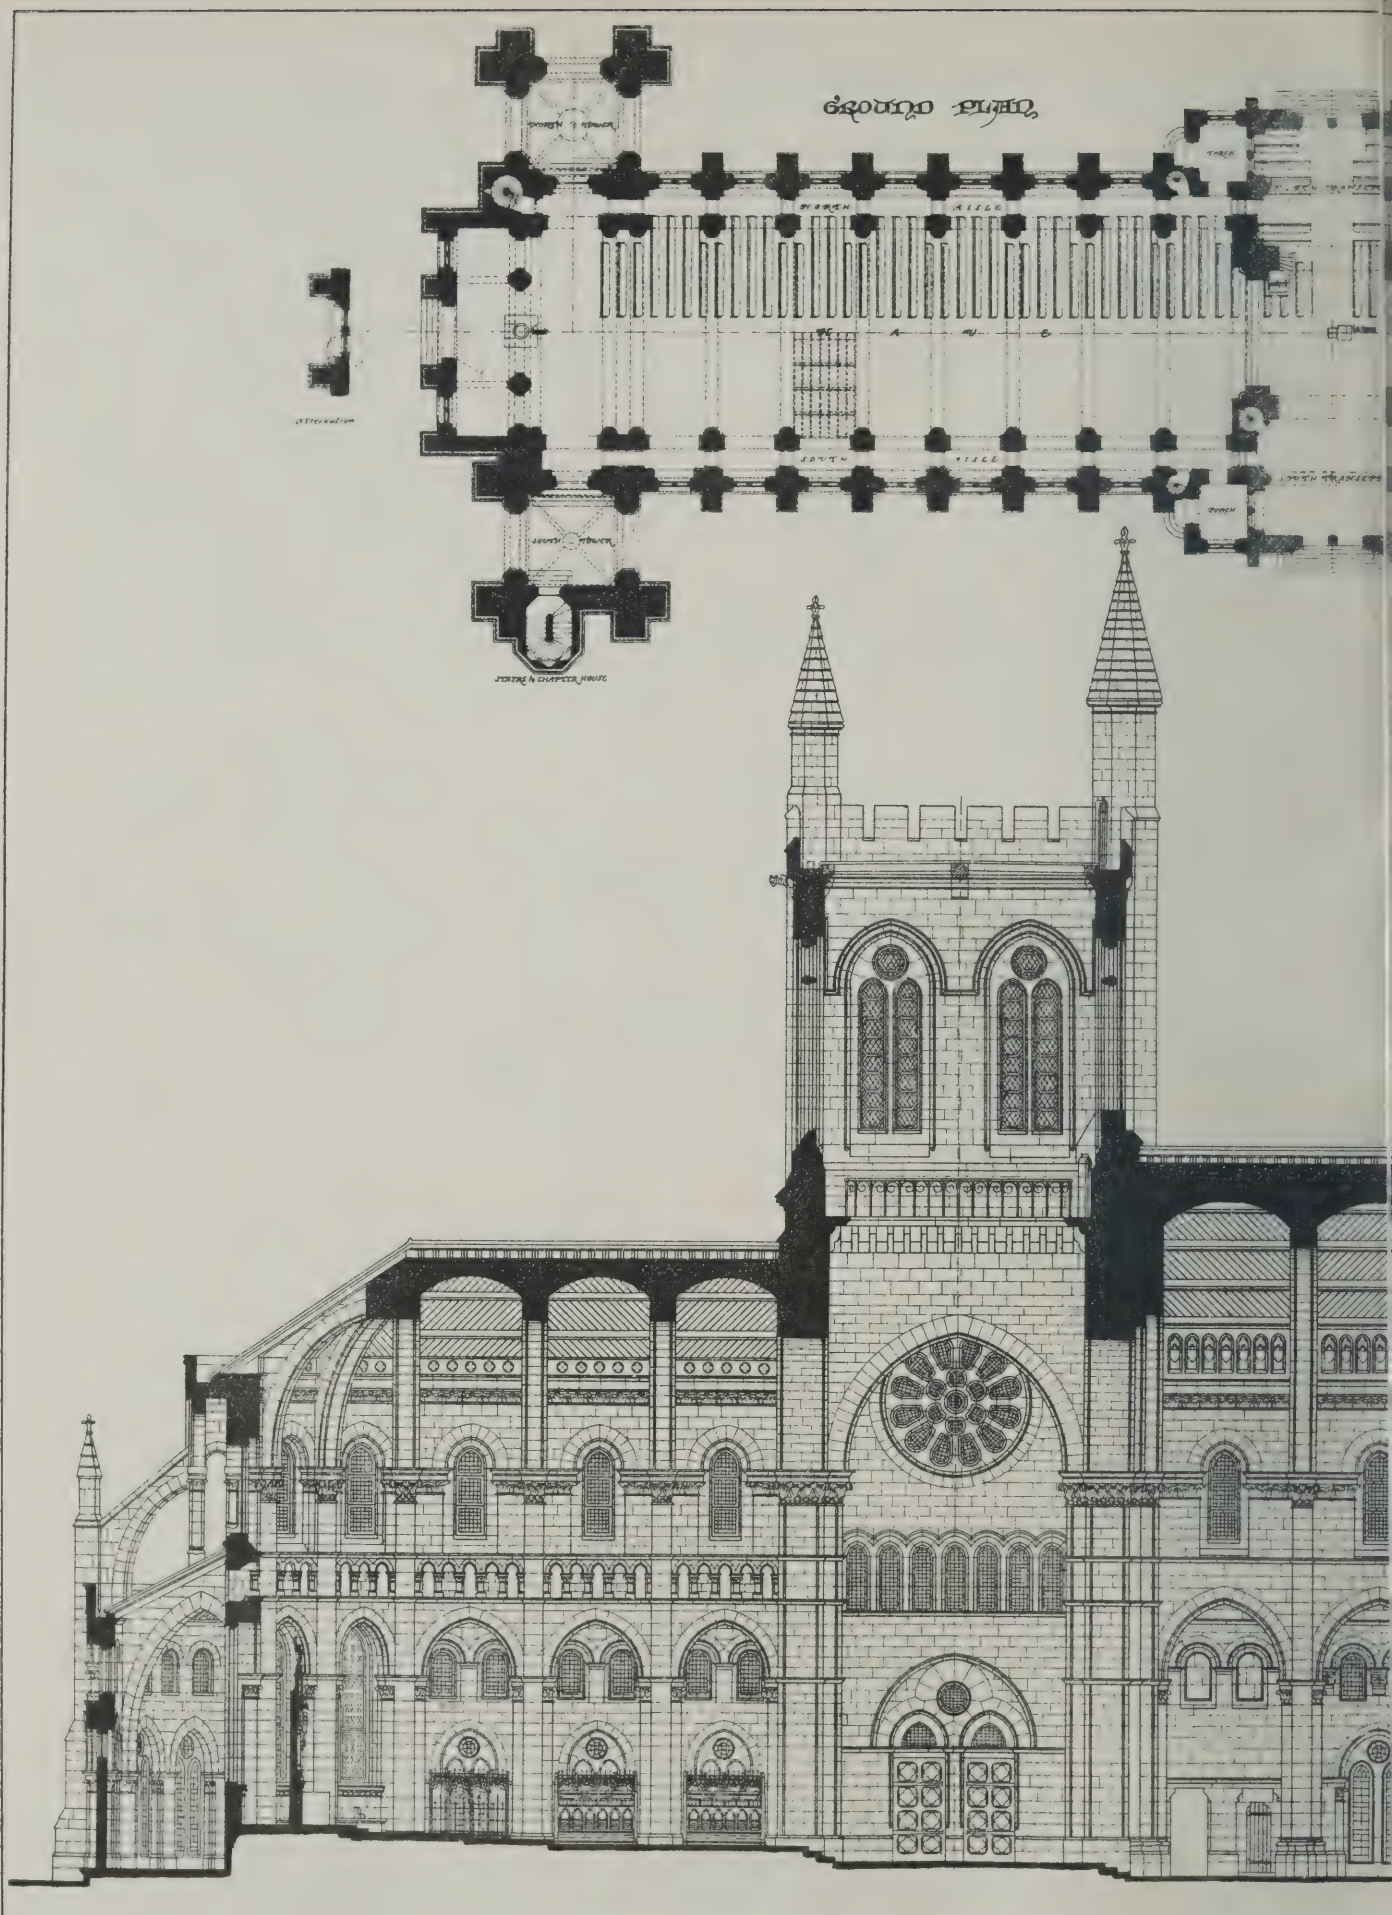
STRESSES IN BRIDGES FOR CONCENTRATED LOADS.

AN exhaustive paper on the calculation of stresses caused by active concentrated loads appears in a recent number of the *Transactions* of the American Society of Engineers. The author, Mr. George Fillmore Swain, C.E., deals with a method of calculating stresses by taking the prescribed actual loads, finding their position on the structure necessary to cause the maximum stress in any particular member. The ordinary method has been to assume a uniform load over the whole length covered by the engines and train, or such load with the concentrated loads for the engines. The leading specifications now require the use of actual loads for engines and tenders followed by a uniform train load. The author proceeds to deal with the moments at any point of a beam, the maximum shear at any point, with and without floor beams. Mr. Swain alludes to the method of finding moments and shears by graphical means, or what he terms "Lines of Influence." The method is well understood by all who have studied graphical statics. The beam is drawn to scale, and the maximum moment at any point on it is to be found for any given load. The influence lines are drawn from each extremity to a point over the beam, such that its vertical height is equal to the product of the shorter segment of beam into which the load divides it by the longer segment divided by the total length. Then at any point a vertical ordinate to the said lines will determine the moment of the load. Any position of actual loads can be thus found. The "influence" line thus enables us to find any moment due to any loading; it also shows how much of the beam must be loaded to produce maximum stress, or at what point a single load must be to produce it. These lines may be drawn not only for moments, but for the shear or for the stress on any bar.

The author proceeds to show how a system of single loads must be placed to cause a maximum moment at any point; how the principle can be applied to find moment of floor beam, for shear and for stress. Examples of maximum shears and moments are given by the aid of diagram. The same system is applied to single intersection trusses, Fink and Bollman trusses, trusses with multiple system of web, curved chord trusses, and cantilevers. Mr. Swain's paper will be read with close attention by all who desire to simplify the operation of finding stresses. The method of moments is applied to the stresses of chords, verticals, and other members. The stresses in cantilevers may be found also by using influence lines, an illustration of which is given. The wide application of the method to all kinds of structures is a well-known fact. Mr. Swain has shown by demonstration and examples the readiness with which the stresses can be determined.

ARCHITECTURAL PRACTICE IN CHICAGO.

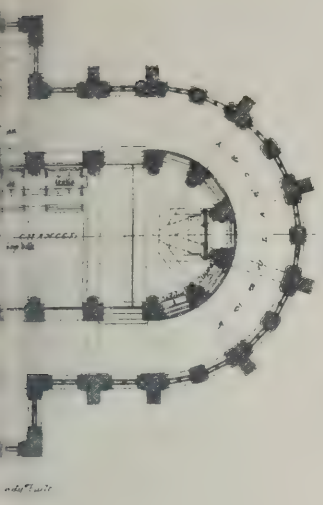
IN a paper on the "Difference between the Methods of Architectural Practice Now and Fifty Years Ago," read before the Chicago Convention of Architects by Mr. W. W. Boyington, the author said there were more architects in practice in the City of Chicago to-day than there was fifty years ago in the whole United States. Half a century ago America knew no styles except the Classic and Gothic, and very few pure examples of either were executed. The majority of buildings were planned and built by master builders, who usually made their plans on the face of the trustle-board, and shaded them with white, red, and blue chalk to designate wood, brick, and stone. Half a century ago there were no Schools of Technology, very few teachers of architecture; young men had to gain their knowledge as best they could. The studies at that time were chiefly the Orders of Classic architecture and their application to various buildings. Geometrical stair-building was at that time considered a great achievement. Fifty years ago, and less, architects were largely supported by contractors; now owners have found it to their interest to deal directly with architects. Formerly miles of street fronts were built from one pattern, as was the case in Philadelphia, but now architects' designs are adopted. English architecture has experienced the same changes. All that Mr. Boyington said with regard to architecture in the States fifty years ago may be said of the art in this country, with some slight differences. Alluding to Chicago, this gentleman said thirty-four years ago master builders drew up their own plans, but in course of time they saw the advantage of giving up designing, which took time, and induced one of their number to undertake plans, entirely guaranteeing him a compensation of two dollars a day. Making plans was ill-paid then; five dollars was considered a good sum for a set of plans for a dwelling. Since then the compensation has increased, and a percentage system adopted, which has become as general as it is in this country. There are said to be now three thousand practising architects in the States, though how many are doing legitimate business is not stated.



BOOKS RECEIVED.

Colour: An Elementary Manual for Students. By A. H. CHURCH, M.A. Oxon., F.C.S., Professor of Chemistry in the Royal Academy of Arts. New Edition (London: Cassell and Company). This little manual is a revised and extended edition of a small volume written by Prof. Church in 1871. The author, whose original researches and experiments are well known, has availed himself of the labours of Chevreul, Clerk Maxwell, Helmholtz, Rood, and others. The work is concisely expressed; thus, the definition of colour is satisfactory. "Colour is an internal sensation, and has no external and objective existence. As, however, it originates, in all the cases considered, in the impact on the optic nerve of that force or energy or 'mode of motion' which we call light, the study of some of the elementary facts of optical science may very suitably precede the consideration of the laws of colour and their application." So we have, first, a *résumé* of facts in connection with physiology and optics, the undulatory theory of light, &c. The subject is scientifically treated. The composition and analysis of light and the solar spectrum receive full attention. The history of the discovery by Sir Izaac Newton, and the experiments of Wollaston and Fraunhofer, are interesting, the author in separate paragraphs giving the results of scientific investigation in a clear manner, explaining the beautiful properties of the white light of the sun, how it can be decomposed into coloured elements, such as red, orange, yellow, green, blue, and violet; and how this white light admits of recomposition by the union of its elements. Those who take an interest in the scientific basis of colour, and all artists must do so, will find Prof. Church's remarks on tints, shades, and greys, the phenomena of colour sensations, complementary colours, simultaneous contrast, and successive contrast are instructive. Several coloured plates illustrating these properties of colours are given, and the observation on contact and separation of colours, double and triple combinations, chromatic equivalents, use of broken hues, will be found of value to artists, decorative artists, and colourists. As a textbook, Prof. Church's little treatise ought to be in the hands of every student.——*Life and Work of Joseph Firbank, J.P.D.L., Railway Contractor*, by FREDERICK MCDERMOTT, Barrister-at-Law, is an interesting sketch of the life of a man who commenced as a railway contractor 50 years ago, and who has constructed various lines in the kingdom. Amongst these contracts were the Settle and Carlisle, Bedford and Cambridge branch of the North-Western, the Bedford and London extension commenced in 1864, Tunbridge Wells and Eastbourne, and Metropolitan Extension to Harrow. He was engaged, too, on many great tunnels—the Woodhead, between Manchester and Sheffield (1841); the Oxted, on the Brighton and South-Eastern; the Belsize, on the Midland; and the Mark Beech, on the Brighton and South Coast, in which class of work his training as a miner had fitted him. Mr. McDermott's biography is of value in showing what indomitable industry and energy, combined with honesty, can do in raising a young Durham miner to a position of wealth. The chapters contain interesting records of Firbank's labours on the various railway systems. One of his latest and important contracts was the extension of the St. Pancras Goods Depot in 1883, including the screen wall surrounding the site on Somers Town adjoining the passenger station and hotel—a fine piece of red brickwork. The wood engravings are all poor, and the narrative would have been quite as well without them.——*Marion's Practical Guide to Photography* (Soho-square) is a new and enlarged edition of a very useful guide, which all amateur and professional photographers should have.

ARCADING OF STONE SCREEN BETWEEN THE NAVE AND NORTH-WEST CHAPEL, LINCOLN MINSTER.



THIS arcading is from Lincoln Minster, and is arranged upon a low screen wall separating the North-West Chapel from the nave. It is Early English in character, and was built about 1220. The arch moulding is very vigorous, and the caps, devoid of all foliage, present a bold outline.

A circus in Nicholson-street, Edinburgh, recently destroyed by fire, is about to be rebuilt from plans prepared by Mr. J. Murray Robertson, of Dundee, the aim in reconstruction being to make the building absolutely uninflammable. The roofing is to be constructed throughout of iron, the walls are of brick and cement, and the whole of the wall surface, floors, and ceilings of the exit and entrance passages will also be of concrete. The roofing of these passages where outside the main building will be of iron. The space under the seats is to be solidly filled up. The seats and stalls are to be coated with asbestos or similar paint. Large iron tanks to furnish a ready supply of water will be erected at the level of the main roof, and hydrants will be put in round the building to the satisfaction of the firemaster. The general feature inside is an amphitheatre, and no part of the audience will be over another except at the main entrance, where there is a small gallery. Altogether there will be eight wide exits from the interior of the circus. Mr. Stewart is the builder.

ST. MARY'S CHURCH, BANBURY, OXON.

SOME few years since this church was restored by Mr. A. W. Blomfield, M.A., and it has been decorated in a very elaborate fashion by Messrs. Heaton, Butler, and Bayne, of Garrick-street, London, as will be seen by the photographic illustration now printed. The chancel lends itself very happily to a mural treatment of this kind, and the dome roof is filled with a representation of Christ seated in glory surrounded by the four-and-twenty elders casting down their golden crowns, while the four emblematic beasts are shown in front of the throne, and the seven lamps burning. In the three bays beneath are represented the Twelve Apostles, richly painted on gold backgrounds, the pilasters and columns are in Pompeian red, embellished with gold ornament, the details being of an elaborate character, both cleverly designed and executed. The remainder of the church is decorated in gold and colours, the whole effect produced is harmonious, rich, and pleasing. Our plate is reproduced from a photograph taken by Mr. G. Mold, of Banbury, and exhibited by him at the recent exhibition of the Photographic Society in Pall Mall.

SKETCHES IN NORMANDY AND BRITTANY.

IN the BUILDING NEWS for October 14th last, we published a series of pencil sketches under the above title, and printed some descriptive notes by their author, Mr. Francis Massey, giving an account of his architectural trip recently made in this district. To-day we give another sheet of his studies chiefly illustrative of old work in Dinan, together with a view of Arguiel Castle, Jersey. These sketches readily explain themselves, each sheet representing a page out of Mr. Masey's sketch-book: hence the quaint arrangement of some of the "notes." Studies of this kind, though open to the charge of being fragmentary, are certainly suggestive, and often useful.

ENTRANCE LODGE, STONELANDS.

THIS lodge stands on the summit of a steep slope close to the high road, from which the drive descends into a valley, rising thence to the house on the opposite hill. The external walls are hollow, those of the lower story, including all moulded work, being of the grey sandstone quarried upon the estate, while the upper story is hung with weather tiling, and the gables are of pitch-pine, coated with Stockholm tar, and roughcast. The roof is covered with brown Broseley tiles. The builder is Mr. James Longley, of Crawley, who has also built the house, stabling, and farm buildings for the owner, Mr. Frederick Frank, from the designs of Mr. Edward W. Mountford.

CANNINGTON CHURCH, ALLAHABAD.

THIS church was commenced some 15 years ago, and was at first intended for the cathedral of the North-West Provinces, and was designed to accommodate some 300 or 400 persons, and to have an open verandah or ambulatory all round. It was, however, afterwards decided that the cathedral of the North-West Provinces should be at Lahore instead, though it is now thought probable that this will eventually form the cathedral church of a new diocese. Since first begun, Allahabad, by reason of the extension of the railway system, has increased so enormously that it is found necessary to provide for the addition to the transept and choir of a nave accommodating a much larger congregation than was dreamed of at first. The illustrations show the new nave and western towers to be added. The nave is 56ft. wide and 130ft. long, and the total length of the church will be 240ft. The choir will probably be situated eventually under the central tower. The great heat necessitates the massive construction, and the two carriage porches under the towers, as well as windows low down that can be filled during the hot weather with wet Cuscus mats. The roof is supported on arches on account of white ants, and the general simplicity of the detail is necessitated by the class of workmen obtainable in this part of India. The pulpit is an exceedingly fine piece of workmanship in alabaster, by Mr. Nicholls, of Lambeth, from Mr. Emerson's designs. The work is carried out in a cream-coloured stone, with fine red sandstone dressings, and the roof is covered with red native tiles. The site is an extremely good one, being in the centre of a large open space at the crossing of four of the principal roads, each about 100ft. wide. Our illustrations to-day comprise a longitudinal section with the principal plan, and a cross section showing the western towers and end of the nave. At an early date we hope to publish some details of the exterior.

COMPETITIONS.

LUDLOW.—The first premium of £20 for the best design for a town hall and covered market, has been awarded by the town council, acting on the advice of the assessor, Mr. F. R. Kempson, of Hereford, to the one submitted under the motto "Straight and True," which proved to be by Mr. Henry A. Cheers, of Twickenham. The estimated cost of the building is £5,000. Mr. Cheers has been definitely appointed architect.

CHIPS.

The Earl of Meath, better known by his former courtesy title of Lord Brabazon, delivered an address on "The Importance of Open Spaces," at the Parkes Museum, on Thursday night, the 17th inst. Mr. E. C. Robins, F.R.I.B.A., presided. After explaining the importance of his subject, the lecturer argued that the City Corporation had set an excellent example in buying Epping Forest, Ham Park, Burnham Beeches, and Coulsden Common.

On Tuesday a special service was held at St. Michael's Church, Tenterden, for the purpose of unveiling a window placed in the sacred building to the memory of Admiral G. T. Gordon, K.H., K.S.F., J.P., by his widow. The subject is Christ walking on the Sea, and St. Peter, as he is sinking in the waves, looking up to Him and seeking His aid. The work has been executed by Messrs. Ward and Hughes.

Mr. W. Noel Sainsbury, of the Public Record Office, editor of the "Calendar of Colonial State Papers," has been appointed Assistant Keeper of the Public Records.

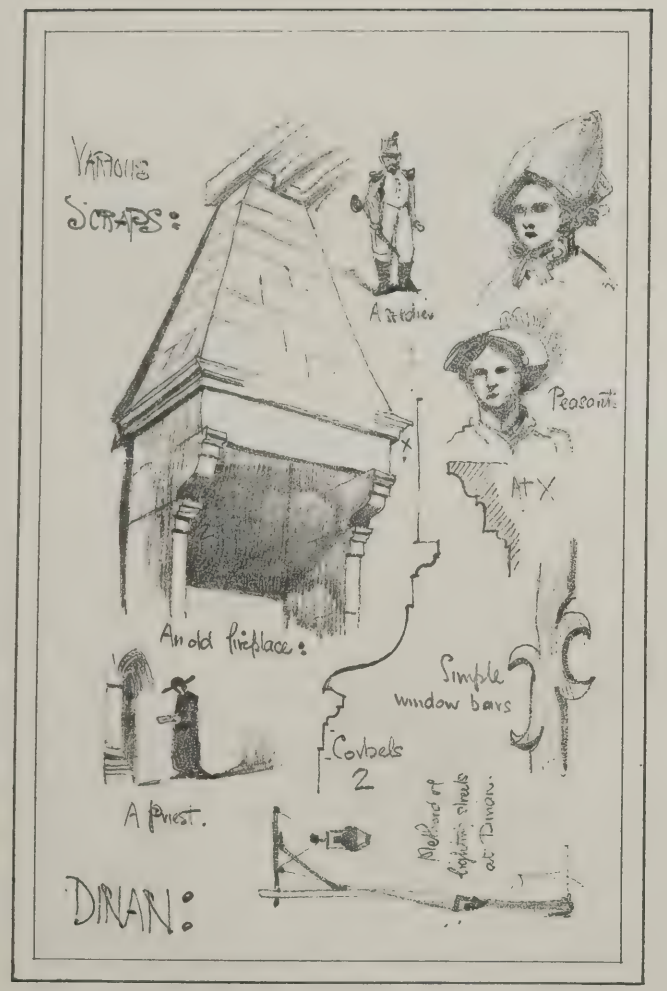
The Forster Memorial Committee have finally decided to erect a memorial statue at Bradford, and to apply the surplus of the subscriptions as a nucleus for a fine art gallery, towards which a sum of £5,000 is promised by Mr. G. Hodgson.

The City Court of Common Council have again discussed the question of the appointment of an architect, and decided at their meeting last week, by 92 to 53 votes, to refer the matter to the Officers and Clerks' Committee to consider and report forthwith as to the duties of the office.

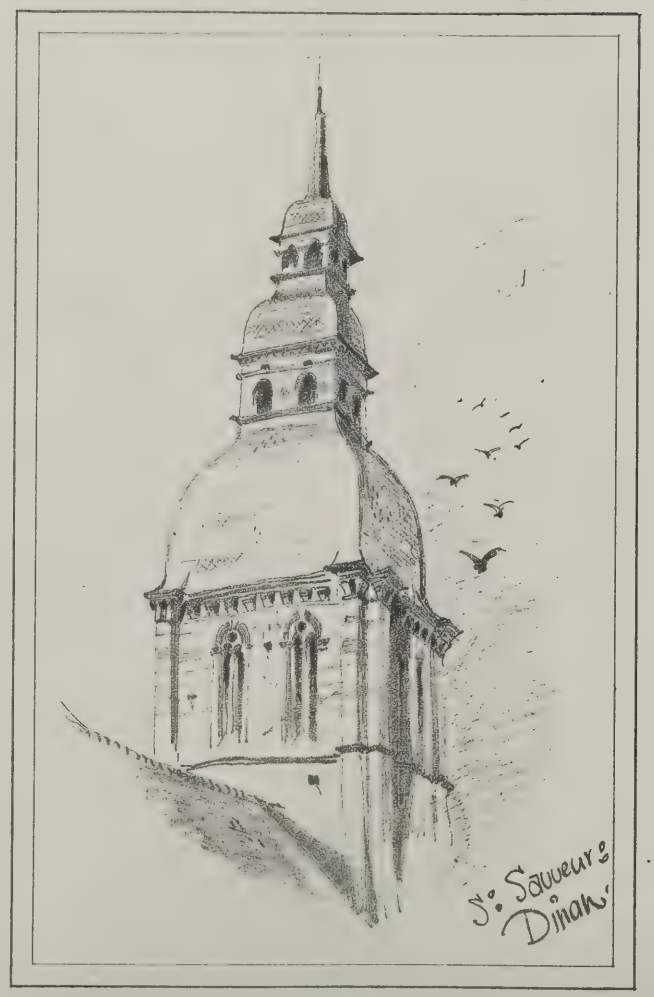
Lord Wolseley will unveil at Liverpool on Dec. 16 a statue to General Earle, who was killed in the Khartoum expedition. We illustrated the statue, of which Mr. C. B. Birch, A.R.A., is the sculptor, in the BUILDING NEWS for June, 1886.

A SHEET OF BRICK GABLES.

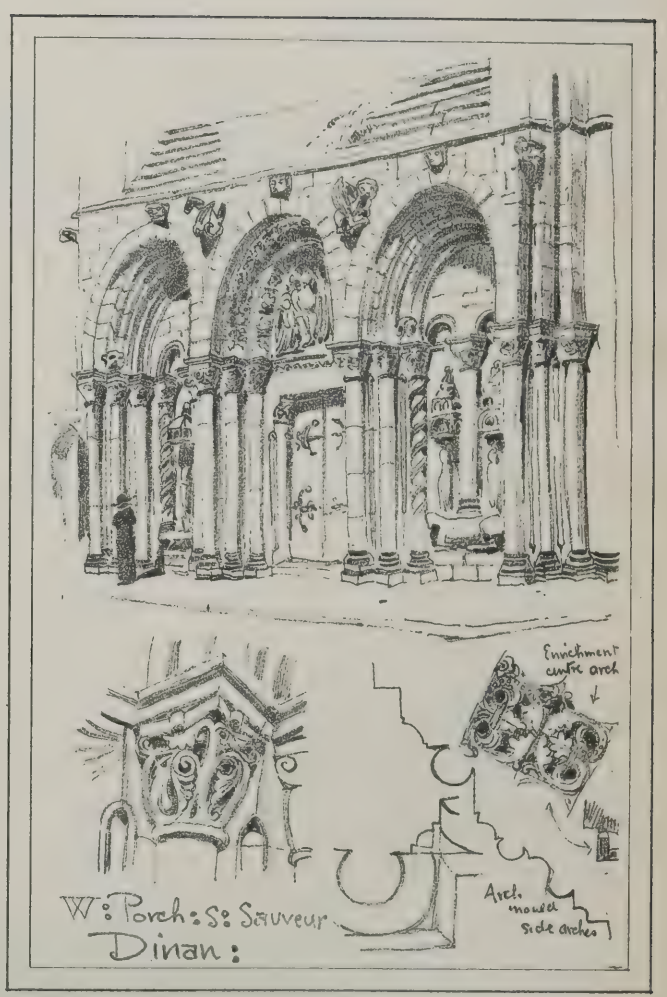
THIS page of drawings of German brickwork is taken from the portfolio of Herr von O. Spekler, Director of the Building Trades Technical School at Erhernforde, entitled "Die Bauformenlehre mit besonderer Berücksichtigung des Wohnhausbaues und der Bürgerlichen Baukunft."* The plates include elementary studies illustrative of the construction of walls, piers, arches, and vaults. Varieties of treatment with splayed and shaped bricks are elaborated with practical diagrams both in sectional drawings and perspective views, showing the bond of the work and its particular jointings. Eaves courses and oversailing cornices, composed of ordinary bricks, are evidently esteemed somewhat highly, though it must be confessed that they are at best but crude contrivances as compared with the details easily obtainable in terracotta, such as we in England are accustomed to in many of our leading public buildings, such as the New Law Courts at Birmingham, now building, or the Science Schools at Kensington and the Natural History Museum. The plate of Herr von Spekler's designs, herewith reproduced, shows a series of typical gables, for the most part constructed of the ordinary brick, and designed with ingenious variety. Figs. 3A and 4A introduce ridge and pantile terminals, and Fig. 4B gives a quaint-looking cresting, Fig. 6C being another example of more simple form. For warehouses and railway stations such a style of work has been often found more or less suitable, being a bold and comparatively cheap form of giving a finish and degree of detail to what, by the nature of things, must otherwise remain possibly a spankingly plain dead wall. To cultivated tastes, of course, a broad well-proportioned breadth of good brickwork is by no means despised or lightly esteemed; in fact, there can be no doubt that our modern designs generally fail on account of their overfussiness and want of dignified simplicity. Tastes, however, necessarily do, and will continue to, differ, so that a large class of readers connected with the arts of building will value the style of design here adapted with so much skill and knowledge of technical detail by Herr Spekler, whose book we may thus introduce on the present occasion. The diagrams on the sheet here printed are delineated to scale, and in a general way will explain themselves. The plates measure 16½in. by 11½in., and several of them are printed in washed tintings. The letterpress pamphlet, with the lithographs, is printed to a smaller size, for easy reference. For technical teachers, this portfolio will probably be found very useful.



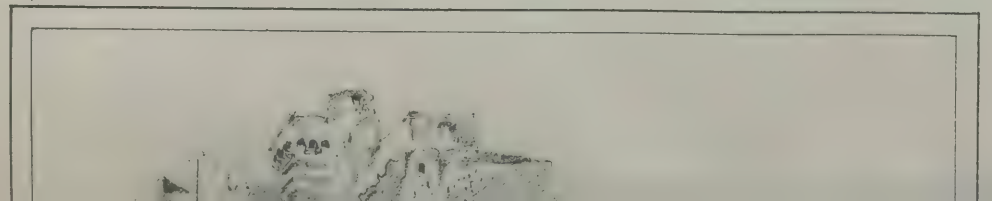
MEMORIAL OF THE LATE REV. W. J. E. BENNETT.



DURING the lifetime of the late Rev. W. J. E. Bennett, vicar of Frome, Somerset, a churchyard cross was erected by him, intended to serve as a memorial of his tenure of the living. The cross and its approaches having fallen into a bad state of repair, it was determined to perpetuate his memory by restoring it and adding an ornamental balustrade, as shown in the drawing. The churchyard being laid out in terraces, the site allows of a prominent position to the memorial, which will group effectively with the fine parish church adjacent. The steps are of red Mansfield stone and the balustrade of Doulting stone, the space inside the balustrade being laid with tile (mosaic), having Mr. Bennett's monogram introduced in the design. The carving is by Mr. H. T. Margetson, of Chelsea; Mr. F. P. Brown, of Frome, is the builder; and Mr. W. V. Gough, 24, Bridge-street, Bristol, the architect.



As a memorial of Canon Alcock's 40 years' incumbency of the parish of Ashford, East Kent, it has been decided to fill the south transept window in the church with stained glass. The committee have requested Messrs. Powell, of Whitefriars, to furnish designs and estimates.



The internal restoration of St. Stephen's Church, Bristol, is being completed under the direction of Messrs. Pope and Paul, of that city. The carving to the seats has been carried out by Mr. Harry Hems, of Exeter, and the lighting and ventilating by Messrs. Jones and Hudson.

WAYSIDE NOTES.

THE City Fathers having changed their minds in the matter of the office left vacant by the death of Sir Horace Jones, we are provided with an interesting topic, and one that affords us margin for considerable speculation. Who is to be the new architect to the Corporation? Have you noticed that Mr. So-and-So has put up for the post? Have you seen the candidates' appeals in the papers? &c.

Personally, I have seen and noted a good deal, and much has struck me as not a little curious. A comfortable berth like that of architect to the Corporation of London has called forth many candidates whose names are familiar to us, and one indeed that is a household word in the profession. Messrs. FF.R.I.B.A. will doubtless come forward in considerable force and endeavour to obtain the very desirable architect- and surveyor-ship. In these times it must appear a sort of heaven upon earth to step into the shoes—large as they were—of the late Sir Horace Jones.

It is to be supposed that merit will go before favour in this instance. We may talk about "exalted Bumbledom," but it is probable that the best man will win the day. Let us hope so, at any rate. It is true the canvasser seems to imagine that if he can show that he is a member of many and varied "worshipful" companies—be they butchers or bakers or spectacle-makers—he is at least a score of rungs of the ladder in advance of his competing fellow-professionals. Perhaps he is right, in spite of our anticipations. "Influence," quoth a rather 'cute friend once, "goes for a good deal in this world; marriage next; and the gift o' the gab is the most powerful instrument of all."

The fact that the City folk have, in the eleventh hour, repented of their former decision ought really to somewhat cheer up those who have got into a Slough of Despond over the prospects of the profession. Touching this question of "the future of the architect," I would suggest that every youngster who enters an architect's office, if he be but fitted for the calling in the first instance, and possesses the *mens sana in corpore sano*, has in his own hands the power to build up a sound reputation and solid business, be the present condition of the profession what it may. But he will not do much if he halts on the way to complain, and he will never reach his goal if he allows himself to grow faint-hearted at every difficulty. Neither as an assistant nor as a full-blown architect will he earn honour or a competency by taking a pessimist view of his own position, that of his profession, or that of affairs in general.

Life is "a soldier's battle," it has been said—a sailor's, too, for the matter of that. Those who can only swim in smooth waters must go under at the first storm they meet. At the present time, as we all know, there is a pretty considerable tempest raging, and the good ship *Architecture* has been buffeted about mercilessly by the waves. But despondency amongst her crew will only increase the danger of the company.

Moreover, the architect is not the only one who has to complain. All businesses are now under a cloud. And to be candid, it must be confessed that it has all along been my innermost thought that, should good business some day result, and some degree of prosperity once more fall upon the old country, all our talk and querulous complaint as to the condition of the profession and the shortcomings of it as a body or in detail would cease, till the years of plenty once more gave way to another period of starvation prices.

Meanwhile, therefore, let us look upon matters in the brightest possible light, and guard against the evil effects of giving way to despair. Let us also—as President Lish suggested in his recent address to the Society of Architects—endeavour to become more practical, and reserve archæology for our own pleasure and delight. There is no doubt that the public (when they think about the matter at all) judge the architect by tests much as those given by Gwilt, which, it will be remembered, are according to his ability to solve the following problems:—(1) For a given sum, as in private buildings, to erect the most convenient and suitable house for his employer; and (2), the requisites in a building being given, as in public buildings, to erect it at the smallest possible expense.

These are both purely practical questions; and, Sir, in directing attention to the necessity for a more practical education for the architect, your correspondent Mr. Woodward has done good service. But if this be so, we should surely recognise Lord Grimthorpe as one of our greatest benefactors. Last Monday there appeared in the columns of the *Times* a letter from his lordship which was not over respectful to architects in general and the R.I.B.A. in particular. Referring to the question of the compulsory examination of all architects, it suggested that *engineers* and *builders* should examine the young architect, and insinuated that architects themselves knew little or nothing of constructional matters!

In last Friday's issue of the journal referred to there was an article on St. Alban's Abbey, detailing the most recent works in connection with the "restoration" of this noble old pile. It is some time now since I was at St. Alban's—two or three years—so I suppose there is much of the building that would be unrecognisable. I remember they were then at work on the nave, and a pretty wholesale restoration it was! Any who may be anxious to "get up" the subject of St. Alban's Abbey will find the work on the history of the building by Messrs. Buckley very complete and interesting.

The chief glory of the external architecture of St. Alban's is—no, *not* the world-renowned turrets at the west end, but the fine lantern tower. There is something of the sublime in this noble mass of Roman bricks, and, in certain lights, there is much of the beautiful. The old bricks have assumed a wonderfully fine tone; and, standing under the south-east angle of the tower, it exhibits a marvellous variety of tints. I trust that it has not been interfered with in any way by the "restorations." To those of us who have not visited the building for years, it is rather a shock to read, in the article above referred to, that "The great increase in bulk from the new roof and turrets is now very striking from the Midland Railway."

It does not appear to me that there can be much gained by this increase of bulk in the roofs. The sturdy old tower will now be less dominant, which is to regretted, as, from its hoary age and noble design, it was deservingly the dominant feature of the composition. A fine object from afar is this old tower. I have seen it miles away, both from the south, where we may look out from an elevated position on the great north road, over miles of pleasant, undulating country, and see its misty outline in the blue distance, or from the road to Dunstable (of Priory renown), when it soars grandly above the trees and house-tops of the old village.

Of archæological interest, I note an illustration in the *Graphic* of a "Nestorian tablet near Li-Ngan," in North-Western China. The tablet is said to date from 780 A.D., and to be the only relic of the Nestorian Christian Church yet discovered in China. It appears from the letter of the gentleman who forwarded the photograph from which the illustration was prepared that the existence of the memorial was known before. It is an upright slab of commonplace outline, but curiously carved. Have been rather "gone" on old sepulchral monuments of late, so endeavoured to find out something about this one, but could glean nothing about it; nor, in fact, anything about Nestorian monuments in general. Fergusson merely hints at the subject.

Oh, Jubilee! What is the profession coming to? The wail is prompted by the perusal of the splendid offer of the East Grinstead Jubilee Memorial Institute Committee. That embodiment of economy proposes to put up nine hundred pounds' worth of loyalty, and offers the fortunate competitor £5 5s. "as his sole remuneration"; and does not pledge itself to employ the architect whose plan may be selected. I hope the committee will not ruin their builder as well as starve their architect—they want enough for their £900. "The building must contain spacious entrance-hall, reading-room and library, committee-room, smoking and games room, coffee bar with kitchen and scullery, lecture-hall *as large as possible*, at least two bedrooms for caretaker, lavatories, w.c.'s, and coal and wood store. The coffee-bar and kitchen will probably be best situated at the narrowest end; but this and *other details* are left to the architect's judgment." All plans must be in by Dec. 10, so the sucking Nelson of the profession has only a fortnight to earn his "honorarium of five guineas" in.

It being requisite to pay over to the Horsham Local Board the sum of ten shillings sterling, if we would become acquainted with the nature of their proposed competition, I have not considered myself justified in surrendering that amount for the privilege of viewing the conditions. Many more must feel that, small though the sum be, it is too large a price to pay for merely satisfying one's curiosity. The wisdom of this kind of "blackmailing" may be doubted. It is, of course, argued that the compelling of the payment of a fee keeps out the smaller fry (though every office-boy might get his aunt to advance ten shillings) and encourages only "genuine" competitors. But one can never tell from an advertisement whether or no it is worth our while to enter a certain competition. By demanding an "entrance fee," therefore, the inaugurators of competitions often debar themselves from the suggestions of good men, as, however wealthy these latter may be, it always goes against the grain of average humanity to part with hard cash on such conditions.

GOTH.

CHIPS.

A new wholesale and retail fish market is being built at Aberdeen Harbour concurrently with the erection of a wharf for the quay adjoining. The cost of the wharf—the piles of which are now being driven by the harbour workmen, under the superintendence of Mr. William Smith, the harbour engineer—is estimated at £4,144. The cost of the market will be about £3,000. The designers of the latter are Messrs. Smith and Kelly, the city architects.

The city council of Manchester accepted, on Wednesday, from Alderman Goldschmidt, a marble bust of the late Prince Leopold, Duke of Albany, the work of Prince Hohenlohe.

The Oriental Museum at Vienna, which during the twelve years of its existence has done much towards promoting the commercial relations between Austria-Hungary and Oriental countries, has changed its name, and is henceforth to be the Imperial and Royal Austrian Commercial Museum. The chief object of the museum, which is subsidised by the Government, will be to offer the fullest information on Austrian trade and art industry, partly by sample depots, partly by lectures and publications.

The premises and timber stacks of Mr. J. R. Roberts, builder, Barkstone-gardens, Earl's Court-road, were destroyed by fire on Monday night.

Some time since two chambers of a Roman house of the 4th century were discovered under the high altar of the church of SS. John and Paul, on the Cœlian hill, at Rome. Quite lately another large chamber has been discovered beneath the nave of the church, which seems to have been the *tabularium* of the house. Traces are visible of paintings representing wild beasts, sea-horses, and other decorations, including two pictures of unquestionably Christian character. This is the first specimen of a Roman house in which scenes of a Christian character have been found represented. Such subjects have hitherto been found only in the catacombs.

On Sunday night the Congregational School Chapel at Blackford Bridge, near Bury, was destroyed by fire. The damage is estimated at £1,300. The fire is attributed to the overheating of the warming apparatus.

The Mayor of Halifax cut on Monday the first sod of the new High-Level Railway for Halifax, which is to connect the upper part of the town with the Great Northern Railway at Holmfield, between Halifax and Bradford.

A new guardians' board-room and offices, which have been added to the workhouse buildings in Hallam-street, West Bromwich, were opened on Friday night. Mr. W. Henman, of Birmingham, is the architect, and the cost has been £11,000.

Building Intelligence.

BAGSHOT.—A hunting-box near Bagshot, Surrey, has been erected for General Hunter Thompson. It is built with red brick, with stucco dressings, &c., and is situated on the north side of the Lightwater-road. The upper windows on the south side of the house overlook what is known as the "Folley," which extends southwards for miles, and is covered with heather and pine trees, and from the upper windows of the north side between and over the foliaged trees of the well-timbered grounds can be seen peeping up almost close at hand the Surrey hills, conspicuous amongst which is "High Curly," the highest hill in Surrey. Both the stables and the hunting-box have been erected by Mr. E. Kemp, of Frimley, near Farnborough. Messrs. Burr and Meadway, MM.S.A., of 65, Chancery-lane, are the architects.

CITY OF LONDON COURT.—The foundation stone of this building was laid by the Lord Chancellor on Wednesday. The building occupies the sites of the old Court, the Land Tax offices, and the tap of the Guildhall Tavern. It will ultimately be extended over the site of No. 84, Basinghall-street, and the new building has been designed to cover the entire area. On the ground floor will be the offices for the clerks and bailiffs, on the upper floor the Judges' Court, 45ft. by 26ft., and the Registrar's Court, 36ft. by 26ft., each with a private room attached and approached by a separate stair. In the basement will be the lavatories and stores for books, papers, &c. The style is Late Gothic, similar to the style adopted for the Library and the new Council Chamber. The external moulded work will be in Portland stone, with grey granite plinths, the walling of Kentish rag; internally, the hall and staircase will be of Bath stone, the open roof of oak; the Courts will have wainscot panelled ceilings. The warming will be effected by means of hot-water coils and pipes. The amount of the contract is £13,637. The architect is Mr. Andrew Murray; the builder is Mr. James Morter, of Stratford.

COOKRIDGE, LEEDS.—A "semi-convalescent" hospital, adjoining the Convalescent Home at Cookridge, is now roofed in, and is being finished in its internal arrangements. The committee for its erection selected plans prepared by Messrs. Chorley and Connon, of Park-row, under whose superintendence the works are being carried out. Accommodation is provided for 42 patients—one-half of these men, the other women and children. All the patients will be on the ground floor. The central portion of the structure is an administrative block, with wards on either side. The closets are fitted with Doulton's isolated pans, having no inclosing woodwork. The baths are of porcelain, and are placed in the centre of the rooms, thus allowing of patients being lowered into them by means of slings. The corridors and wards are warmed by steam supplied by a boiler, which also heats water for baths and lavatories. The buildings are erected of brick, with stone dressings, the upper stories being finished in rough-cast cement and with half-timbered work.

KNOTTINGLEY.—The Archbishop of York took part in the reopening of St. Botolph's Church, Knottingley, on Friday. The interior has been completely transformed, a clean sweep having been made of the old fittings. The chancel has been enlarged, and an open-timbered roof has replaced the old plastered ceiling. The east window is to be filled with stained glass. Formerly the pews encroached into the chancel, the floor of which was level with the nave. These have now been removed, and carved oak clergy and choir stalls have been erected in place of them. The organ, which stood in the west gallery, has been placed in the chancel, the floor of which has been raised 2ft. The entire church has been re-seated with open seats in place of high-backed pews, and the galleries on the north and west side have been taken down. The carrying out of this work has necessitated the expenditure of £2,100. Mrs. Rhodes has presented a carved stone pulpit, adorned with statuettes of saints in white marble, and a font, both being the work of Messrs. Jones and Willis, London. The same lady has also given the lectern. The altar cloth has been embroidered by the East Grinstead Sisters. Messrs. John Hall Thorp and Son, Leeds, have done the joinery work.

CHIPS.

At a late hour on Monday night a fire broke out at the Ship Hotel, Greenwich, resulting in considerable damage and total destruction of the two top floors. The hotel is so well known in connection with the Ministerial Dinners held there that it is of general interest. The origin of the fire was supposed to have originated through the kitchen flue (on the top floor of hotel) becoming overheated.

Mr. William Wimble, of Queen Victoria-street, has been appointed architect and surveyor to the Vintners' Company.

The *Croydon Advertiser* is giving a series of articles on "Surrey Artists and their Houses." The subject of the first of the series is Mr. Edward Frampton, of Buckingham Palace-road and Sutton, whose design for a stained-glass window for Newcastle Cathedral was illustrated in our last issue.

The names of Francis Butler, of Edith-grove, Fulham-road, Earl's-court, architect, and of Joseph Walker Peters and Charles Alfred Stevens (trading as J. W. Peters and Co.), Red Cross-street, Southwark, artists in stained glass, appear in Friday's list of receiving orders in bankruptcy; and among the adjudications in bankruptcy in the same *Gazette* is Goodman Brown (trading as Brown and Son), Kingsland-green, High-street, Kingsland, builder, surveyor, and contractor.

St. Cuthbert's window in the south aisle of the choir at York Minster will be opened on Sunday next, after renovation at a cost of £800.

The local board of Pudsey, near Leeds, have accepted the resignation of their surveyor, Mr. Isaac Wood.

A reredos, built entirely of alabaster, has been erected in the parish church of Whitechapel by Mrs. Coope, as a memorial of her late husband, Mr. Coope, M.P., who defrayed the entire cost of erecting the church, amounting to £30,000.

Mr. Bridgeman, Lichfield, has been selected to execute statues of the Queen and the late Prince Consort for the Royal Albert Asylum, Lancaster. He has just completed some pulpit work for the church of St. Michael and All Angels, Christchurch, New Zealand.

The Metropolitan Board of Works, at its meeting on Friday, passed by 18 votes to 14, the following resolution:—"That Mr. T. J. Robertson, assistant surveyor, be removed from the Superintending Architect's Department, and that it be referred to the Works and General Purposes Committee to consider to what position he should be transferred."

The Wharf Station at Newhaven, recently built in woodwork for the Continental traffic of the London, Brighton, and South Coast Railway, was destroyed by fire on Sunday. The damage is estimated at £6,000.

Mr. Whistler has decided on a new departure in "private views." The winter exhibition of the Royal Society of British Artists will be first opened to an invited company at 9.30 this (Friday) evening, Mr. Whistler preferring to make the private view an evening event, and to show the pictures by gaslight rather than run the risk of showing them on a foggy day.

The town council of Bristol have decided to contribute £1,800 towards the restoration of the Mayor's Chapel on College-green, in accordance with the report and plans of Mr. J. L. Pearson, R.A., and on condition that another £1,800 needed to complete the work is raised by subscription.

A formal contradiction has been given on behalf of Dr. Schliemann to the report that he had expressed an intention of bequeathing his collection of antiquities to the Berlin Ethnological Society or to the German Government. Dr. Schliemann is at present engaged in excavations at the Temple of Venus, in the island of Cerigo.

The Governors of Alleyn's College of God's Gift have now opened their secondary college in Townley-road, Dulwich, for the education of some 450 students in advanced science and technical subjects. The buildings have been erected at a cost of about £12,000, by Messrs. Oliver and Leeson, architects, of Newcastle-on-Tyne, whose plans, submitted in competition, were selected on the advice of Professor T. Hayter Lewis and Mr. Charles Barry, F.R.I.B.A., the assessors appointed by the Governors.

The internal decoration of St. Anne's Church, Manchester, has just been completed by Mr. Reuben Bennett, of that city.

Engineering Notes.

BRADFORD.—On Friday last, Major-General Hutchinson, R.E, one of the inspectors of the Board of Trade, visited Bradford to inspect the tramway which the Bradford Corporation has constructed from Four Lane Ends to Allerton. The new line is constructed on Winby and Levick's system; it consists of a steel rail weighing 65lb. to the yard, and a continuous wrought-iron base plate 12in. by ⅝in. Although this system acts well enough for horse traffic, it does not seem to answer on severe gradients where heavy steam-engines have necessarily to be used. The Tramways Committee of the Bradford Corporation, acting on the advice of the borough engineer (Mr. J. H. Cox), therefore decided that any future extensions should be laid on the Gowan system. This method was adopted on the Manchester-road line, which was laid in 1884, and up to the present time, we understand, it has proved eminently satisfactory. It has also been adopted on the Allerton line. The rails are made of rolled steel of T-section, and weigh 103lb. to the yard, 7in. deep, and 7½in. bottom flange. They are fastened together with steel fish plates, and securely bolted with four 1in. bolts. The ends of the rails are laid on a wrought-iron bed plate, 12in. by 12in. by 1¼in. Wrought-iron tie rods, 1¼in. by ⅝in., with screw ends, are fixed at intervals of 15ft., thus keeping the line rigid and secure to gauge. The rails are laid on a foundation of concrete composed of 1 part of lias lime and 5 parts of broken stone and sand. A layer of pitch is run between the base of the rail and the face of the concrete, and effectually prevents any water getting under the rails, and in addition makes the rail firmer. The points and crossings are 12ft. and 8ft. long respectively, and have been made out of the rail by Messrs. Thwaites Bros., Limited, of Bradford. The gauge of the new line is the same as that of the other tramways in the borough—namely, 4ft., and the interspace between the double lines is 4ft. 3in. The length of the route from Four Lane Ends to Allerton is 2,081 yards, of which 839 yards is double line in six passing places, and 1,242 yards is single line. The tramway between the rails, and for a distance of 18in. on each side, is paved throughout with granite setts, 6in. by 3in.; where the most severe gradients occur, Dalbeattie granite setts are used, the steepest being 1 in 19½. Both at Four Lane Ends and at Allerton triangular termini have been constructed; this entirely obviates the danger which exists on steep gradients of the car running away when it is necessary to uncouple the engine and car before a return journey can be made. The Allerton line has been constructed under the supervision of the borough engineer (Mr. J. H. Cox, M.Inst.C.E.), assisted by Mr. W. H. S. Dawson. Major-General Hutchinson expressed himself as satisfied with the result of his inspection. The line was opened for public traffic on Saturday.

The Archbishop of York opened, on Friday, the new church of St. Saviour, at Ulleshelf, near York. It has been erected as a chapel of ease to Kirby Wharfe Church, and is situated in the centre of the village. The building is in the Late Gothic style, and accommodates 180 persons. It consists of nave and chancel 21ft. wide and 68ft. long. The walls are of brick, with moulded strings and stone traceried windows, and the roofs are slated. A bell turret, covered with lead, and containing a bell, marks the division between nave and chancel. The cost will be £1,000. Messrs. Demaine and Brierley, of York, are the architects.

The arts committee of the Liverpool town council have recommended for purchase by the corporation the following pictures from the current Autumn Exhibition at the Walker Art Gallery:—No. 243, "Pelagia and Philamon," £400, by Arthur Hacker; 247, "The Bow Net," £150, T. F. Goodall; 962, "The White Lady of Nuremburg," £220, Wyke Bayliss, R.B.A.; 1,117, "Peonies," £300, by C. E. Perugini. The exhibition will close at the end of next week, and a soiree and conversazione will be given on Monday, December 5. The attendance of visitors shows a falling off from previous years.

Mr. C. W. Methven has been appointed engineer to the Greenock Harbour Trust. He was for many years assistant engineer under Mr. W. R. Knipple.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

MANCHESTER ARCHITECTURAL ASSOCIATION.—The ordinary fortnightly meeting was held on the 15th inst. at the Diocesan Buildings, Mr. T. Chadwick in the chair. Mr. J. Corbett, sanitary engineer, read a paper on "House Hot-Water Fittings," which was elaborately illustrated. The development was traced from the crude "set pot" or water-box in a cooking range to the present cylinder with its necessary circulating pipes, safety valve, &c. Special appliances were described for intercepting and removing deposits of lime and mud from the boiler. Precautions against frost are necessary, and instances were quoted of collapsed cylinders, frozen pipes, damaged boilers, &c. A vote of thanks, proposed by Mr. Hodgson, seconded by Mr. Woodhouse, and supported by the chairman, was carried unanimously.

SCOTTISH ARCHÆOLOGY. — The thirty-first annual meeting of the Glasgow Archæological Society was held on Friday night in Glasgow, the Rev. Prof. Lindsay, the president, in the chair. The council's annual report congratulated the members on the growing interest in the objects of the society, and stated that the membership was now 267. Dr. R. W. Cochran-Patrick, F.S.A., then delivered the opening address of the session, his subject being "Archæology in Scotland, its Past and Future." He said that for a long period the sympathy of large classes in Scotland had been alienated from the study of archæology; but Scottish antiquaries of some generations ago had themselves to blame because they had neglected the proper scientific methods. In the present day they lived under happier conditions. The real object of archæological study was clearly recognised. They had realised that it was possible to get real knowledge out of the past otherwise than by the testimony of record only; and that the only way to do this was by a scientific method, the first step to which was the accumulation of the largest possible body of carefully-ascertained facts. Proceeding to trace the progress of Scottish archæology down to the present day, he dwelt at some length on the rise and progress of the Scottish Antiquarian Society. The credit of first employing a strictly scientific method of collecting archæological facts was due to Mr. Rhind, Mr. Petrie, and Dr. Joseph Anderson, in the investigations conducted by them in Caithness and Sutherland, which first gave the clue to the true historical position of the "brochs" in past times. Under the head of "Future Prospects of Scottish Archæology," he elaborated numerous suggestions with the view to progress, pointing out that the first and most important condition was the collection of thoroughly reliable facts. He suggested that the National Society should take the initiative in inviting the co-operation of local societies and museums towards the publication of a complete collection of Scotch antiquities. A local society should work up its own district, and the more members confined themselves in their papers to what they saw and knew, the more valuable would be their work. A record should be made of every monument of antiquity at present existing in Scotland.

The Lingen Monuments in Hereford Cathedral have just been restored, at the cost of Lord Lingen, the present head of the family, and has been set up in the Bishop's cloisters, close to Cecilia Lingen's grave. The monumental stone commemorates, as the low brass tablet which adjoins shows, two cousins, Cecilia, daughter of Sir Henry Lingen, died 1689, and Blanche, daughter of Roger Lingen, died 1721. Mr. E. H. Lingen Barker, of Hereford and London, was the architect; Mr. Robert Clarke, of Hereford, the carver, and Mr. T. J. Gawthorpe, of Long-acre, W.C., executed the brass plate.

At St. Paul's Church, Stafford, the new tower and spire were dedicated last week. The church is a cruciform structure in the Early Decorated style, and was erected in 1844 from designs by the late Mr. Ward. The new tower is on the south side of the church, and has been built from designs by Mr. Robert Griffiths, county surveyor of Staffordshire. Both the tower and spire, a broach one, are executed in Weston and Alton stone, and rise to the height of 122ft. Mr. H. Lovatt, of Wolverhampton, was the contractor.

The town council of Doncaster have decided to take steps for obtaining plans for a proposed new Free Library and School of Art, the maximum of cost being fixed at £3,300.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—J. A. and Son.—W. F.—C. S. and Co.—C. and Co.—H. A. C.—J. K. and Co.—S. and W.—M. Bros. and Co.—C. L.—R. and R.—H. and Co.—M. H. and Co.—E. and Son.—B. L. B.

THE "BUILDING NEWS" DESIGNING CLUB. (In reply to numerous inquirers, we cannot undertake to send the rules of the club by post, or to answer individual inquiries. The rules were published in the "B.N." of Nov. 4, and intending competitors must get that number.)

Correspondence.

ARCHITECTS' AND ENGINEERS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—It has been decided by the Architects' and Engineers' Registration Act Committee to appoint local honorary secretaries throughout the United Kingdom for the purpose of making known the scope and object of the proposed Act, and I should be glad if you will allow me space to bring this to the notice of your readers.

The duties, I imagine, would not be arduous; but the most important step to take would be to seek interviews with members of either House of Parliament representing the various cities and towns where the local hon. secs. are appointed. A petition in favour of the Bill praying that the Bill may pass into law has been prepared, and will be placed in the hands of the local hon. secs. for the purpose of obtaining signature.

The name of a well-known member of the House of Commons, with whom arrangements are almost complete to pilot the Bill in the House early next session, will be published almost immediately.

I shall be glad, therefore, if gentlemen interested in this important movement, willing to undertake the duties of local hon. secretaries, will at once communicate with me in order that I may submit their names to the next meeting of the committee.—I am, &c.,

EDGAR FARMAN, Hon. Sec.

39, King-street, Cheapside, E.C.

ARCHITECTS AND SPECIALISTS.

SIR,—The times of the architects have very much altered, as you have had occasion to hint of late; his lot has fallen on what he may choose to think evil days; he is no longer looked to as a designer of Greek temples or Gothic shrines, but as some one able to build with attention to a hundred little wants and details, and to give his attention to special requirements, like sanitation. This conclusion is forced upon us when we look at what the better informed among the profession think they ought to know, but which very many unhappily do not. The letters you have lately published from Mr. Wm. Woodward, Professor Corfield, M.A., M.D., Mr. Hugh Roumieu Gough, and others on "The Future of the Architect," will have convinced the most sceptical of the versatile nature of the modern architect's requirements, and of the opposite opinions entertained of his acquirements. While one with true *esprit de corps* defends the profession from the charge of ignorance in sanitary matters, the others boldly deny their attainments. The controversy has arisen from misapprehension. In the first place, it is a mistake to assume that because the principles of sanitation are simple and few, the majority of architects understand them, or because a few individuals have mastered the science others have done so. Years ago we showed the very few and simple rules upon which a perfect system of house drainage consists, and which may be summed up under the words "disconnection" and "ventilation"; yet it is by no means unusual to find the drainage of houses for which architects have been engaged based upon the erroneous system of a quarter of a century ago. How is it that at least 70 per cent. of the houses now built retain the old connected and sealed drains, the same deadly traps of lead, the same laying on of sewer gas into the house? The Acts in operation have not, at least, reached the builder of suburban dwellings. We admit there has been a great deal of unnecessary talk and fuss about house drainage by those whose business it is to introduce new inventions, and this will continue so long as the profession employ specialists and do not trouble to master the subject. Why have the sanitary engineer, the specialist, and the professor sprung into existence? Simply because architects have permitted them to do so. Specialists of whatever kind are the growth of circumstances; they could never have obtained a footing if architects and others had rendered their services unnecessary. But if there are specialists of medicine, of engineering, and other subjects, why not specialists of architectural science? At all events, the profession now is passing through a revolutionary stage of its existence. There are those within the ranks of architecture who are profoundly sensible of the shortcomings of architects, others who believe it has little need of instruction. Perhaps it will be said they are as well informed as most professional men are: but this standard will not now do. The age says, "Press onwards. You cannot learn too much; for if you are satisfied with your attainments, the specialist will overtake you."

We are quite of the opinion of Mr. Woodward when he says: "The architect should, even if he avails himself of the specialist, be his master, and not allow the positions to be reversed"; but the fact is that knowledge gives power, and the specialist who knows, let us say, iron construction better than the architect can and will take advantage of his position when any chance falls to his lot. We have known of engineers who have been called in by architects to prepare details for ironwork compete with them, and send in designs when such a building as a large winter garden or an iron and glass structure has been wanted. We know, too, that sanitary experts compete every day with the architect in reporting on the sanitary condition of houses. Other specialists, like decorative artists, do the same. Can we stop this invasion of the architect's province? In these days of free trade in art, as in commerce, there is no alternative but to convince the public that we can do better, or that by the employment of the architect the client obtains a *quid pro quo* for the money he expends. The specialist devotes himself exclusively to one thing—iron construction, sanitation, ventilation, or decoration; and as

matter of course he often is enabled to excel the architect in this particular branch, the same as the special practitioner in nervous diseases, an oculist, or aurist excels in expertness the general medical practitioner when a case of partial paralysis, the eye, or the ear is involved. And it is quite impossible for one man to become an expert in each of these cases. In architecture the art has unquestionably suffered from the division, as I have shown before—the system has tended to produce unsatisfactory design as a whole, inharmonious combination, and a lack of general unity and feeling. Yet we cannot help it. The architect of the future will have to grapple with this problem. There is only one method by which the disconnected and disjoined arts can be reorganised—namely, the wider interest and sympathy of the architect in the accessory arts, a wider knowledge of them, and, above all, co-operation with the workers.

On all sides we hear of the architect's "aloofness," of his keeping "above" the rank and file of the building industries and manufacturing interests; of his one desire to be thought a "professional man"; of his general incapacity to descend from "fine art" to the practical art worker, or to understand technical processes—aims that seem in strange contrast to all we read of the old masters of the art. No wonder Mr. Lish, in his opening address the other night at the Society of Architects, dwelt rather strongly on this professional bias and forgetfulness of those who make up the thews and sinews of art, and spoke of the importance of a more thorough acquaintance of the trades. If architects are to retain their position in the public regard they must first set their own house in order, before attacking the pretensions of those whom their own indifference has called into existence.—I am, &c.,

G. H. G.

THE FUTURE OF THE ARCHITECT AND "THE ARCHITECT OF THE FUTURE."

Sir,—It would be interesting to learn from Mr. Woodward what proportion, if any, of the "works ranging from £4,000 to £100,000 carried out by builders without the aid of architects," have been satisfactory—satisfactory from the employer's point of view that is. It is, in reality, not of very much consequence to architects whether they think well of the builders' designing or not. The important point they should consider is, it appears to me, Is there a demand for builders who can design? and if that question can be answered in the affirmative, it is utter folly in them not to supply the demand. I am afraid some of the kid-glove and "gentlemanly" architects might consider their social position lowered by being at the head of a building business; but need this be the case, and is not "chief builder," the architect's right place?—I am, &c.,

Charles F. Moxon.

THE A.A. SKETCHING CLUB.

Sir,—Will you kindly allow me to invite the assistance of all who take an interest in the proposal made in the paper on "Our Sketching Club Scheme," either by volunteering to act as vice-consuls, or if not able to undertake the regular duties to furnish us with particulars of any buildings of interest they are acquainted with? Any information forwarded to 157, Wool Exchange, Coleman-street, E.C., will be most gratefully acknowledged; it should be tabulated in the following manner:—

Subject.	Name.	Place.	County.	Date of work or style.	Architect.	Any features of particular interest.	Remarks. Especially note if illustrated or not.

We hope that the value of such a register will be sufficient to induce all who have the power to forward the movement to the utmost of their ability.—I am, &c.,

Herbert D. Appleton.

DRAUGHTSMEN'S PROVIDENT FUND.

Sir,—May I through your columns thank those gentlemen who have written to me concerning the above? I cannot write to each one separately, because I am pleased to say that now their number is too great. It is, therefore, from no want of courtesy that their letters have not been answered. Their names will not be lost sight of; when the committee, which is now formed, has drawn up rules, &c., they shall have a copy, and it is to be hoped they will all become members.—I am, &c.,

W. A. Chambers.

44, Battersea-rise, S.W., Nov. 21.

SCARBOROUGH CONSTITUTIONAL CLUB COMPETITION.

Sir,—I notice design for the above-named building in your publication for October 28th, with statement to the effect that the arrangement is almost precisely similar to the original design.

The following statements placed side by side show that such is not the case:—

DESIGN SUBMITTED IN COMPETITION.	DESIGN AS ALTERED SINCE COMPETITION.
1. Twelve offices provided in all.	1. Eight offices only in all.
2. Conveniences on north side.	2. Conveniences on south side.
3. One card room on first floor, instead of near billiard room, as stipulated.	3. This card-room is now altered and placed on ground floor, as stipulated.
4. Servery lighted from dome only in adjoining corridor.	4. Servery lighted through screen apparently; the room also is differently situated.
5. Large assembly room on the southern side.	5. Large assembly room on northern side (thereby greatly improving approach, &c., to the retiring room).
5. Main staircase on north side.	6. Main staircase on south side.
Memo.	Memo.
7. The cost stipulated in conditions was £3,200, and was to include architect's commission and all other cost in the erection of the building.	7. Lowest tender published at £3,774; add commission, say, £188; making total cost, £3,962.

With regard to the cost, the same space only (as in original plan) is covered, and as four offices are omitted, it seems that the cost should be less instead of more, the space simply being thrown into the club portion, and consequently requiring less partition walls, fittings, &c.

It would certainly be interesting to the numerous competitors to receive the assessor's explanation with regard to these discrepancies, also to see his report published on the designs received.—I am, &c.,

A Lover of Fair Play, and Competitor.

Nov. 22.

SEVILLE CATHEDRAL—GOTHIC FOLIAGE.

Sir,—Mr. Doughty speaks of having sketched his view of Seville Cathedral "in the building"; but surely it is from some gallery at least 60ft. or 70ft. above the floor, and looks rather as if through one of the outer windows, exactly level with the sill of the chief lateral one shown. I was struck by the discrepancies between this view and Fergusson's plan. According to him, all the nave severies are but five, and beyond the crossing are three of similar width to those of the nave. The view shows four on this side the crossing, and but one beyond it, or possibly the vaulting of two, a high screen shutting off all beyond the first pier. No severy of the vaulting, however, appears any narrower than the crossing or *ciborio* itself, and as the next before it, or last one of the nave, shows a lierne vault, of the exact pattern of that under the tower of Salisbury, a pattern only suiting a square, not an oblong plan, it forces on us the notion of square severies throughout; whereas Fergusson is positive as to the *ciborio* alone being square, all the clerestory severies oblong, in the ratio of $\sqrt{2}$ to 1 that he thought peculiar to this building. Neither he nor Mr. Doughty, nor any account I have read, notes the greatest peculiarity thereof: that its vaults have never been covered by any roof, but remain with their backs open to the sky. This, without going within 1,000 miles of Seville, I can certify by a photograph taken from the adjoining Giralda tower that I happen to have seen.

On the question of what plants were the chief models to the Gothic carvers, I am astonished that the frequent resemblance to celery is not remarked. Long before comparing any of their decorations therewith, I had thought that nothing else in our markets was on the whole so beautiful as celery, both for subtle gradations of curvature, colours, and richness of form. The Early English foliage proper, till about 1260, does not seem to suggest any particular plant, but rather to have developed from the illuminated manuscripts. With the Eleanor crosses, distinct botanical imitation seems to have begun, and for the next century it looks to me as if celery had afforded the designers most suggestions.—I am, &c.,

E. L. Garbett.

HOUSE DRAINAGE.

Sir,—Mr. John W. Alexander, in your paper of the 18th inst., says:

> "I consider a patentee a dangerous person to employ, as he naturally leans to his own nostrum, even though in his heart of hearts he may know it is not the best. I had some experience of this when inspecting some large house drainage works carried out by Mr. Rogers Field, C.E., when his patent trap was, in my opinion, used in season and out of season."

The facts are as follows: I have no "patent trap," nor any trap in which I am pecuniarily interested. Moreover, I do not use a multiplicity of disconnecting traps in my practice, but limit their number as much as possible, frequently using only one. I think your correspondent should, therefore, be more careful in what he says.—I am, &c.,

Rogers Field, M.Inst.C.E.

4, Westminster Chambers,
Victoria-street, S.W., Nov. 23.

SANITARY ASSOCIATIONS AND HOUSE DRAINAGE.

Sir,—I have carefully read the letter from Mr. John W. Alexander, diocesan surveyor for York (on p. 779); but so far as I can judge from it, he seems to know about as much of what constitutes the sectional system of house drainage as I do of Hebrew, and I have yet to learn its alphabet.

He considers "a patentee a dangerous person to employ," and he "carefully eschews any connection with patents." James Watt and Sir William Thomson would be persons that Mr. Alexander, from his superior elevation, would have nothing to do with; and yet, I believe, he will often avail himself of the steam-engine. Professor Fleeming Jenkin, F.R.S.E., when he started the first Sanitary Association in Edinburgh in, I think, 1878, also published that he intended to steer clear of patents; but after a few words from me before the Royal Scottish Society of Arts in Edinburgh, he found this was a mistake, and afterwards wrote:—"Mr. Buchan's (patent) trap is excellent, and largely used at the recommendation of the Sanitary Protection Association in Edinburgh." So if Mr. Alexander has been really eschewing patents, I expect that for his own credit and the benefit of his employers, he had better begin to use some of them, and see and do it properly.

Mr. Alexander says he objects to the sectional system of drainage because it prevents proper cleansing and flushing of the drains with air. He does not know what he is writing about; it does neither. Further, his own words prove his ignorance practically of the subject when he tells us that a Buchan's trap "was forced by the pressure of air." If the trap was forced, that showed want of ventilation, which Mr. Alexander should have provided for. And seeing he has confessed to this overlook or mistake, we may ask, "How many more exist?"

It is perfectly astonishing the amount of ignorance that still exists in quarters where we would not expect it—*e.g.*, an I.A. architect, several years in business in Glasgow, a few days ago wrote: "House drains are generally 9in. in diameter, soil-pipes 6in., and the clean water, rain, and waste-pipes 4½in. in diameter"! A clerk of works, again, who led me to understand that he knew how to fit in my traps with side fresh-air inlets, had all these connected with bends stuck into the *top* of the traps, so that when I came to examine how things were working I could see nothing! All the bends had to be taken out and the work done so as to ventilate without interfering with provision for examination, &c.

Mr. Alexander says he is ready to follow Mr. Honeyman. Very good; but with the drain-pipes at present in use Mr. Honeyman and I are "at one," and I carried out the drainage work of Craigton Castle and other places for Mr. Honeyman upon the sectional system. Mr. James M. Gale, C.E., the well-known engineer of the Glasgow Corporation Waterworks, had his house drainage altered by me this year upon the sectional system, and he says: "If a trap be good between the drain and the sewer, I

cannot see why it should not also be good between the house and the drain."

As to Mr. Norman Shaw fitting up water-closets without water traps, that has been condemned long ago by Mr. S. S. Hellyer and Mr. Ernest Turner, F.R.I.B.A., of London, and by myself. In doing work in this style, Mr. Shaw, in my opinion, only shows that although he may be a good artistic architect, he is a very bad sanitary plumber.

A good many people with a weak corner in their cranium do things, not in the best way, but in an odd sort of style, merely because they imagine it is odd, or novel, while it is simply an oddity.

As to Mr. Honeyman's Bolton paper, I beg to say that I have not as yet heard any sanitarian of eminence support it, while many disapprove of his proposed new pipe. It could not be fairly discussed, however, unless an illustration of the pipe were given.—I am, &c.,

W. P. BUCHAN.

Intercommunication.

QUESTIONS.

[9473.]—**Hospitals.**—Could any reader give me particulars of the latest publications upon hospital planning, sanitary arrangements, &c.? Also, what hospital is considered to be the most perfect?—STUDENT.

[9474.]—**Ordnance Maps.**—Will some reader kindly explain the meaning of the following contractions and figures occurring on a 6in. ordnance map? "Cr. 321·5," and "Snr. 323·0," preceded by a round dot enclosed in a triangle. Also "Bolt 144·1," and the letters "R. H." and "C. R," occurring at lines of fences.—P.

[9475.]—**Extras and Omissions.**—I am a surveyor for some alterations and additions to a building which was let to a firm of builders who completed the contract, upon which are some deductions, also extra works. I have asked them to please send me their priced quantities, so that I may make out a balance-sheet for extras and omissions of the work in order to pay them. But they refuse to let me have the priced quantities. What is my remedy? I do not wish my name to appear in print.—J. T. S.

[9476.]—**Symbols.**—I should be glad to know if these are the correct symbols for the Four Evangelists:—St. Matthew, the Angel; St. Luke, the Ox; St. Mark, the Lion; and St. John, the Eagle; and if not too lengthy, how they came to be applied to each? Am I right in believing they originated in Byzantine art?—WM. JONES.

[9477.]—**Moreton Old Hall, Cheshire.**—Can any reader inform me how the spaces between the framed timbers of this house (which was built about 1556), were filled in? Was it "brick nogging" or "wattle and plaster"?—MINERVA.

[9478.]—**Lime-Washed Walls.**—In last week's BUILDING NEWS the question is asked, "How to remove whitewash from outside stone walls"? I ask and should be glad to know how not to remove limewash from the inside of brick walls?—as one of my rooms has been whitewashed—lime was ordered—and a portion of the white is removed every time any article of clothing comes in contact with it. Can anything be put into the lime to prevent this?—LIMEWASH.

[9479.]—**Ecclesiastical Architecture.**—Are there any works published treating of the distinctions between the different orders of monastic establishments? Can anyone tell me the peculiarities found in Benedictine abbeys and of a few typical examples?—ALPHA.

[9480.]—**Harmonies of Contrast.**—What colours would make a harmony of contrast suitable for a dining-room? Any hint will oblige.—A SUBSCRIBER.

REPLIES.

[9459.]—**Concrete Roofs.**—I venture to offer Mr. H. Melbourne a little advice on the above. In the first place, 9in. by 2in. joists, 30in. apart, 18ft. bearings, covered with match-boards, would be far too light to carry a 3in. bed of concrete, then afterwards to be coated with asphalte and cement, ½in. thickness, to be used for stores, &c. Whoever suggested to construct a roof as given above would surely be trying on a joke. To carry such a load, the joists should not be less than 11in. by 3in., 15in. centres, with two rows of stout bridging, and covered with 1½in. boards. But why load the roof with cement concrete when the following would be equally effective at about half the cost? One and a half years ago I superintended the erection of a range of No. 14 shops for the Lancashire and Yorkshire Railway Co., in the neighbourhood of Victoria Station, Manchester. The roofs were constructed as follows:—11in. by 3in. joists, 16ft. bearing, 15ft. centres, then sloped on the top side to give a fall to gutters of 1 in 60. The gutters were on each alternate party wall, then laid with 1½in. rough-sawn boards, afterwards covered with Graves's Patent Roofing or Danish asphalte (manufactured by the Graves's Patent Roofing Company, New Ross, Ireland). The asphalte was laid on 1½in. by 1½in. wood rolls, then coated with two coats of patent mastic and dry river sand. The whole has now a very neat appearance, very hard, and forms a substantial dry roof.—CLERK OF WORKS.

[9452.]—**Norman.**—William de Carileph, Bishop of Durham, laid the foundation of the present cathedral in the year 1093; but no considerable progress had been made at the time of his death, which occurred two years afterwards. His prececessor, Ralph Flambard, carried on the work, and had nearly brought it to its completion when he died, in 1128. The aisles and transepts were finished by the monks in 1133, and the chapel of the "Nine Altars" was commenced about the year 1230. In the year 1091 Herbert de Lozinga, who came from Normandy with William Rufus, purchased the bishopric of Thetford for £1,980, and for this and other Simoniacal practises was commanded by the Pope to build certain churches and monasteries. He removed the see from Thetford to Norwich, and in the year 1096 he laid the foundation of a new cathedral. In the course of five years the cathedral was in a great state of forwardness, as well as the palace on the north and the priory on the south side, both begun at the same time. The choir, transepts, and central tower are the work of this bishop, who died in 1119. Eborard, his successor, completed the cathedral by building the nave, which, in the year 1171 was a good deal damaged by fire, and was restored by John de Oxford, who finished his work about 1197. The cathedrals of Gloucester, Norwich, and Peterborough, the chapel in the Tower of London, Tewkesbury Abbey, and the churches of Kilpeck and Mocas, in Herefordshire, East Ham in Essex, Steetly in Derbyshire, and Checkendon in Oxfordshire, still retain the Norman apse. The remains of the original churches of Brixworth and Worth also show the apsidal termination which is, I believe, of Saxon date.—A. C. W.

[9453.]—**Load on Beam.**—"G. B. N." will require the weight each beam will sustain in the middle if supported at the ends, because it is the point of greatest strain, and if the beams are strong enough to bear the weight in the centre, he may rest assured it will bear the weight if distributed as in his question. The rule is—Multiply S by four times the depth and by the area of the section in inches, and divide the product by the length between the supports in inches, and the quotient will be the greatest weight the beam will bear in pounds, and a fourth of the result will be the safe load. Value of S for pitch-pine = 1632.

Value of S. Depth of beam. Area of section.

$$1632 \times 18\text{in.} \times 4 \times (18\text{in. by } 18\text{in.}) = 158630{\cdot}4\text{lb.}$$

$$\frac{158630{\cdot}4}{\text{Length of bearing } 240\text{in.}} = 17{\cdot}7 \text{ tons}$$

$$\frac{158630{\cdot}4}{4} = 17{\cdot}7 \text{ tons}$$

so each beam 18in. by 18in. and 20ft. span will bear a load of 17·7 tons in the centre of the beam.—C. C. H.

[9460.]—**Formula.**—The value of T would be 4·28; but it would not be correct for practice unless D = 1·06, the given formula only applying to arches in which D = ·4 $\sqrt{}$R.—PHOS.

[9461.]—**Picture and Chimney.**—If the chimney breast was covered with silicate cotton (slag-wool) 1in., it would prevent the picture being injured by the heat.—C. F. DEAN.

[9464.]—**Tiles in First Floor.**—It certainly is not good construction to lay tiles on the top of flooring. If you really do wish tiles on first floor, take up your flooring, fillet joist and cut in boards 2in. below top edge, and fill up with fine concrete and bed tiles. Would recommend thin parquet flooring—warmer for the feet, and may be laid thoroughly waterproof at a cheaper cost without removing original floor.—H. D. H.

[9466.]—**Early Churches.**—Mention is made of Kempley and Adel churches in Bloxham's "Gothic Architecture," but no plans are given. I presume that "Student" wishes for instances of English churches with aisles, as of course there are a very great number of churches with aisles abroad, which were built long before the 12th century. I therefore send a list of some of the more notable. The cathedrals of Canterbury, Winchester, St. Alban's, Norwich, Lincoln, Rochester, Carlisle, and Durham, which were founded previous to the year 1100, were all planned with aisles; and the churches of Brixworth, being, perhaps, the most complete specimen of Saxon work now remaining; Wing, in Bucks; St. Michael at St. Alban's, built in 941; Repton; Worth in Sussex; Brassington in Derbyshire; Waltham Abbey; the chapel in the Tower of London, and others.—A. C. W.

[9467.]—**Stone Beams.**—Example, Temple of Pæstum.—L. H.

[9468.]—**Whitewash.**—To remove whitewash from outside stone walls use warm water with a stump brush, plenty of rubbing and rinsing. But are you sure it is whitewash? I should give an opinion it is limewhite, and in this case your only chance is to scrape.—H. D. H.

[9470.]—**Gas-Lighting for Draughtsmen.**—I have never found any gas-burner absolutely steady. I have always used the Argand as being the best. In the house I occupy at present however, there are no pipes, and I took no steps to put them in, for the gas is very dear here—4s. 6d. per 1,000. I had, therefore, to take some other course, and acting on the advice of a friend experienced in the use of petroleum oils, I adopted the "Silber" burner and Strange's A 1 crystal oil. The result is perfectly satisfactory. I fitted a brass cup or basket upon the gas-bracket to receive the vessel, and surmounted the burner with an opal reflecting-up shade. The light is a beautifully soft white light, and absolutely steady. It is quite a relief from the unsteady gas.—WILLIAM PEACHEY, Saltburn-by-the-Sea.

[9471.]—**Music Hall.**—There is an article on the regulations for the better construction of music-halls, &c. in the BUILDING NEWS. Vol. XXVI., p. 528.—A. C. W.

Mr. James Young, who was believed to be the oldest Freemason in Scotland, died at Stevenston last week. Deceased, who was a builder by trade, was initiated a member of the Stevenston Thistle and Rose Lodge, Stevenston, on the day that Queen Victoria was born, the 24th May, 1819, so that he had been a freemason for nearly 68½ years. He attained his 90th year a month ago, and two weeks ago he took part in the centenary proceedings of his mother lodge. For more than forty years he was in the employ of the late Provost Barr, of Ardrossan.

At a vestry meeting held at Lymm last week it was decided, in accordance with the report by Mr. J. S. Crowther, of Manchester, to take down and rebuild the upper 40ft. of the tower of the parish church, at an estimated outlay of £1,000.

LEGAL INTELLIGENCE.

SERIOUS CHARGE AGAINST AN ARCHITECT.—At the Winchester Assizes on Monday, before Mr. Justice Wills, Thomas Fleming, 48, architect, was charged with feloniously causing to be delivered to Ellen Clark a forged process, purporting to be a copy of a writ of summons. The prisoner formerly lived at Southsea, and married as his second wife a friend of the prosecutrix, who also lives there. Soon after the marriage she left him, and went in the first instance to the house of the prosecutrix. In January of this year he wrote to the prosecutrix threatening her with an action, and in September sent her a printed form of a writ summons, issued by the High Court of Justice, with particulars filled in, and purporting to be a copy of a writ in an action by himself against her. It was proved that no such writ had been taken out and filed at the Central Office. When charged with the offence the prisoner said that he had only meant to show the prosecutrix the sort of document he was going to serve on her through her solicitor. The jury found the prisoner guilty of serving a forged writ, with intent to intimidate, and his Lordship, taking into consideration the fact that the prisoner had been six weeks in prison awaiting his trial, ordered him to be bound over in his own recognisances to appear and receive judgement if called upon.

ACTION FOR QUANTITIES.—SCHOFIELD V. BARNADO AND ANOTHER.—(Queen's Bench Division, Nov. 21, 22, and 23.—Before the Lord Chief Justice and a Special Jury.)—In this case Mr. James Schofield, a quantity surveyor, of Bloomsbury, sued Dr. Thomas J. Barnardo and Mr. Ebenezer Gregg, an architect, to recover £123 5s. 11d., balance of an account for professional services rendered in connection with the Edinburgh Castle Mission Hall, Limehouse. The defendants denied their liability on various grounds. In June, 1883, Dr. Barnardo was contemplating building the Mission Hall in question, and employed Mr. Gregg as his architect. The plaintiff was engaged as quantity surveyor, and there was some alteration of the plans which involved extra work. The lowest tender being £11,200, in excess of the sum which Dr. Barnardo was prepared to spend, the plans were abandoned and others made in accordance with which the mission hall was erected at a decreased cost. The plaintiff's charges in regard to the quantities of the original plan amounted in all to £273 5s. 11d., and of this sum he had received £150, his claim now being for the balance. On behalf of Dr. Barnardo it was stated that he only authorised the preparation of bills of quantities which should limit the cost of the building to £5,000. As to part of the work, the defendant contended that if the architect employed the plaintiff it was on his own account, and further, it was alleged that the charges were excessive, and that the £150 paid was sufficient to satiify the plaintiff's claim. The hearing of the case occupied three days, and a large number of witnesses were called. The Lord Chief Justice, in summing up, said, while giving full credit to Dr. Barnardo for absolute truthfulness in intention, suggested to the jury that perhaps from sanguineness of temperament Dr. Barnardo had confidently expected the cost not to exceed £5,000, and so had come to think that he had actually, in conversation with Gregg, as he alleged in defence, imposed that limit. This limitation, however, was denied by Gregg. It was for the jury to say what they deemed the more probable explanation of this difference. As a rule, he ventured to state with confidence that it was the part of the builder, for whose convenience it was done, to pay the quantity-surveyor. The payment, probably in every case, eventually came out of the building proprietor's pocket, as the amount was probably in every case added by the builder to the amount of his tender; but it was another thing for the surveyor to claim, as a matter of contractual right, to recover it from the building proprietor. However, here it seemed that, by his payment of £150 to Gregg, Dr. Barnardo had deprived himself of the right to raise that defence; and the main question for the jury would be one of amount—viz., whether the payment made by Dr. Barnardo was, in fact, sufficient. The jury found for plaintiff, as against Dr. Barnardo, £68 7s. 1d., as against Gregg, £38 17s.

The timber stores and premises of Mr. Leonard Marshall, timber merchant, James-street, Old-street, E.C., were destroyed by fire on Saturday night.

Mr. J. Thornhill Harrison, C.E., Inspector for the Local Government Board, held an inquiry at Birmingham, on Friday, upon an application by the town council for sanction to borrow £78,869, for the erection of assize courts, and £6,000, for the purchase and adaptation of premises to be used as judges' lodgings. Mr. Aston Webb, F.R.I.B.A., joint architect with Mr. Ingress Bell, of the courts, produced the plans.

STAINED GLASS.

DODDINGHURST PARISH CHURCH, ESSEX.—This church, which has recently undergone complete restoration, has recently had all its windows filled with stained glass in harmony with the various periods of architecture. The east window, which is of three lancets, consists of the subject of the Te Deum, representing "All Saints," to whom the church is dedicated. The centre light contains Our Lord in glory, surrounded by a multitude of cherubs, of remarkable pieces of ruby glass, forming a special feature in the design; at His feet the earth, His footstool, and the four winged beasts, above the cherubim and seraphim, and below all St. Michael overcoming the dragon. In the side lights are groups of Apostles, Prophets, Martyrs, and Holy Church, divided by a belt of Holy Innocents, the whole surmounted by canopies of the 13th-century period. On the south side of the chancel are three single-light windows, with the scenes of "The Agony in the Garden," "The Crucifixion," and "The Entombment." On the south side of the nave is a window with stonework of 15th-century date, and filled with glass of the same period, and consisting of three lights; this is treated with the subject of "The Marriage Feast at Cana," running through the whole. Above are delicate canopies peculiar to the period, making an interesting contrast to those in the east window. On the north side are two single-light windows, the one "Our Lord in the Temple among the Doctors," and the other "His Blessing Little Children." The ornamental portions of these windows, together with those on the south side of the chancel, are varied specimens of the 14th-century period. The great west window, which is a three-light Perpendicular one, is filled with the scene of "Our Lord's Charge to St. Peter," and the treatment is remarkable for its simplicity, being devoid of all ornament. In the centre light is our Lord, in the left St. Peter, and in the right St. John; in the foreground are groups of sheep, and in the background the Lake of Gennesareth, while the figures themselves are little short of life-size. The whole work was designed and executed by Messrs. A. O. Hemming and Co., 47, Margaret-street, Cavendish-square, London, W.

CANTERBURY.—The City Council have just received a report from Dr. J. Brigstoke Sheppard as to the stained glass in the City Museum. Dr. Sheppard says the Museum windows are filled with fragments of glass evidently collected from many different buildings, but all belonging to one style of art, and almost to one century. The greater part of those pictures in anything like a complete condition consists of roundels or circular plates, many of which are accompanied by inscriptions. From these inscriptions it may be gathered that the several pictures of this class were paid for and dedicated by benefactors whose names are appended to the roundels, the date of the gift being often also given, and that the pictures once adorned the windows of chantries or side-chapels of churches in Holland or Flanders. The glass is interesting rather than valuable, having all been manufactured between the years 1550 and 1700, at the time when the art of making stained glass had greatly degenerated, and was on the point of dying out. Whilst the windows are wanting in glow of colour and rich illumination, nevertheless the scenes represented in the various pictures are mostly interesting, instructive, and even amusing, from the lively manner in which they delineate the ordinary occupations and costumes of Dutch men and women of 300 years ago, and from the quaint shapes in which their ideas of the scenes and personages of sacred history are expressed. From the inscriptions, then, and the comparatively modern date of the glass, Dr. Sheppard concludes that up to the year 1700 devout Dutchmen continued to spend a pound now and then in decorating their guild-chapel, that at the beginning of this century the armies of revolutionary France invaded what are now the kingdoms of the Netherlands and Belgium, one result of the invasion being that the Canterbury Museum has painted glass which some prudent person appropriated and exported when he had the chance. The east window of the south (Bourne Park) aisle of Bishopsbourne Church is filled with glass out of the same batch as those in the Museum. The City Council resolved that tenders be invited for wire protection to the windows.

M. Louis Gallait, the celebrated Belgian historical and portrait painter, died at Brussels on Sunday. The deceased was in his 77th year, having been born at Tournay in 1810. M. Gallait was elected in 1869 an honorary member of the British Royal Academy. His last great work was "The Plague of Tournai."

The tender of Messrs. C. Shepherd and Son, of Cardiff, has been accepted at £349, for the erection of Wesleyan Sunday schools in Roath-road, Cardiff. The architects are Messrs. Habershon and Fawckner, of London, Newport, and Cardiff.

Our Office Table.

As will be seen from our report of the meeting at the Society of Architects on Friday last elsewhere, the Draughtsmen's Provident Fund bids fair to become a reality. The thanks of all likely to be interested are due to Mr. Chambers and the other gentlemen who have laboured to bring about the formation of the association, and it is to be hoped, as soon as the rules are tabulated and the society registered, members and subscribers will hasten to enrol themselves. The assistants especially should now bestir themselves. At more or less frequent intervals during the past 20 years men among them have occupied our correspondence columns with pleas for the establishment of a Provident Fund—let them now see that the opportunity is secured.

MR. LAWRENCE HARVEY begs us to state that the President and several members of the Council of the Royal Institute of British Architects have decided to give a prize for the best working drawing and model of the vaulting at the angle of a cloister. Full particulars of the competition, which will be open to everyone, may be obtained on personal application to the secretary of the R.I.B.A., at his office, 9, Conduit-street, Hanover-square, on the 4th of June next. The working drawings and written explanations of the methods followed will have to be delivered to the secretary of the R.I.B.A. on the following Monday, June the 11th. The candidates whose drawings and papers are considered satisfactory will be invited to construct the models on which the prize will be finally awarded. The prize of ten guineas will be given to the best model presented; the other candidates selected to compete in making the models will receive honorary mentions and certificates. In view of preparing candidates for this competition, Mr. Harvey has undertaken to open a second evening class of masonry at the City and Guilds of London Central Institute, Exhibition-road, S.W. Applications to join same to be sent as early as possible to Mr. Lawrence Harvey, 10, Great Queen-street, Westminster. We are glad the Institute is moving in this important matter. If they and Mr. Harvey will accept our co-operation we shall be pleased to supplement the encouragement thus offered by adding a second prize of £5 5s., to be awarded by them on the same conditions.

APPLICATION will be made to Parliament next session for leave to bring in two Bills in connection with the proposed parks for Vauxhall and Brixton. By the Bill relating to Vauxhall Park, powers will be sought to purchase the Lawn and Carron-house, Lambeth, the lands proposed to be acquired comprising about 8½ acres. In the Bill relating to Brixton Park power will be asked authorising the purchase of Raleigh House and lands surrounding, and certain adjoining houses and gardens at the Lawn, Brixton-hill. Clauses will be inserted in both Bills authorising the preservation of the properties to be acquired as parks, gardens, or open spaces, and conferring on the Metropolitan Board of Works and the Lambeth Vestry the necessary powers of purchase. The Metropolitan Board of Works decided on Friday, on the motion of Mr. F. H. Fowler, to contribute £1,500 an acre towards the cost of purchase on condition that an equal amount is given by the Lambeth Vestry.

MR. J. C. HORSLEY, R.A., writing to a Staffordshire correspondent on Government art schools and technical education, says, referring to the South Kensington Museum, "that from the date of Redgrave's retirement the whole character of the school has become changed, and from being one in which the all-important work of design for manufactures is the chief consideration, it has drifted slowly but surely into a place of perfunctory art teaching for the delectation of shoals of female amateurs, and for the turning out of a cartload of most mediocre artists of both sexes, who flood the country and public exhibitions with worthless productions. It is doubtless owing to this action that at the Royal Academy, for instance, whereat some 15 or 20 years since from 4,000 to 5,000 works were sent for annual exhibition, that number has of late years more than doubled. I cannot, however, do more now than hint at this large and important question, which calls for the most searching investigation, and especially at the hands of the British taxpayer, for whereas in 1837 the original grant to the School of Design was £1,500 per annum, the total cost of the present establishment in 1886-7 was £410,337."

THE committee of the Palestine Exploration Fund have received a letter from Herr Schick, of Jerusalem, containing interesting particulars of new discoveries with reference to the topography of the neighbourhood of the Church of the Holy Sepulchre in that city. At the south-east corner of the block of buildings which includes the Church of the Holy Sepulchre, the Russian and Greek churches have been clearing the ground and erecting new buildings. One result of these alterations has been to sweep away the old street mentioned in "La Citey de Jherusalem" (about 1187 A.D.) as "une rue coverte à voute, par u on va el mostier del sepulcre." Many years ago the street was walled up, and until now no one suspected that it had remained almost intact to our own day. The removal of the old street led to a discovery of even greater interest—viz., that it had been built upon an ancient pavement of very large, flat stones, of great thickness, which proved to be a continuation of the pavement found some years ago in the ground to the north owned by the Russians. This pavement is, with much probability, regarded as the actual work of Constantine, part of the "space open to the sky which he paved with polished stones," or of the wide market-place at the east-end of his group of churches in honour of the place of Our Lord's Resurrection. If so, there is an end of a very important part of the controversy which has raged for so many years over the so-called Church of the Holy Sepulchre, and the theory of the late Mr. James Fergusson may be treated as having been finally disposed of, for Constantine's site is thus proved to have been that on which the present church stands.

THE first of a course of six lectures on Raphael Sanzio was delivered by Mr. T. Matesdorf at Steinway Hall, Lower Seymour-street, on Wednesday week. The lecture was illustrated by about 20 limelight reproductions of Raphael's pictures. The lecturer dwelt on the various influences by which the early work and life of Raphael were affected. He entered upon a critical examination of the art of the great master as regarded from historical and other points of view. The motives of several of Raphael's earlier masterpieces were explained, and attention was drawn to the respects in which they differed from those of his masters. The opinions of the best English and Continental critics with regard to the various phases of Raphael's art were cited in the course of the lecture. The "Sposalizio," the "Three Graces," the "Vision of a Knight," and the Madonna Ansidei were among many other of Raphael's works which were criticised and examined by the lecturer. The many changes of possession which most of Raphael's pictures have undergone, and the extraordinary prices which have at various times been paid for those highly-valued works were also touched upon.

MEETINGS FOR THE ENSUING WEEK.

MONDAY. — Royal Academy. Lecture No. 6 on "Chemistry," by Prof. A. H. Church. 8 p.m.
Society of Arts. "The Elements of Architectural Design," Cantor Lecture No. 1, by H. H. Statham. 8 p.m.
Leeds and Yorkshire Architectural Society. "The Legal Registration of Architects," by J. W. Connon.

TUESDAY.—Society of Architects. "Technical Examinations," by G. A. T. Middleton, secretary. St. James's Hall, Piccadilly. 7 p.m.
Birmingham Architectural Association. "German Romanesque," by A. Reading.
Institution of Civil Engineers. Discussion on Sir F. A. Abel's paper on "Accidents in Mines." 8 p.m.

WEDNESDAY.—Society of Arts. "Economical Illumination from Waste Oils," by J. B. Hannay. 8 p.m.

FRIDAY.—Architectural Association. "Perspective Drawing and the Apparent Form of Objects," by F. T. Baggallay. 7.30 p.m.
Institution of Civil Engineers, "Classification of Continuous Railway Brakes," by A. W. Metcalfe. 7.30 p.m.

SATURDAY.—Association of Public Sanitary Inspectors. "The Duties of Port Inspectors of Nuisances," by Dr. W. Collingridge. 6 p.m.

Architectural Association. — "Perspective Drawing," by F. T. Baggallay. 7.30 p.m. December 2.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1717.
FRIDAY, DECEMBER 2, 1887.

EMPLOYERS' LIABILITY FOR UNUSED QUANTITIES.

IS an employer responsible for the preparation of quantities for a building which exceeds in cost the sum of money he had agreed to expend? This, in brief, is the question that was raised in the case of Schofield v. Dr. Barnardo and Gregg, before Lord Coleridge and a special jury in the Queen's Bench Division the other day. It was an action by an architect and surveyor for the balance of a claim in respect of professional services as a quantity surveyor. Dr. Barnardo, well known in connection with philanthropic enterprises, engaged Mr. Ebenezer Gregg, an architect, to prepare plans for a Mission Hall at Limehouse, and in prosecution of his duties the latter employed plaintiff to take out the quantities for the new building, and also to make certain alterations in the said quantities, consequent upon certain alterations being made in the plans of the building. Mr. Gregg acted as architect and agent of Dr. Barnardo, as he said in his defence, within the plaintiff's knowledge, and did not employ him as a principal. The architect also pleaded that none of the expenses were incurred by his order. Dr. Barnardo pleaded that he had contracted alone with Mr. Gregg, and that his agreement with him was that the mission hall was limited in cost to £5,000, beyond which he was not liable. The lowest tender was £11,200, a sum much in excess of the limit Dr. Barnardo had agreed to spend. The plans were therefore abandoned and others made for a smaller building at a reduced cost, and the mission hall was built in accordance with them. The plaintiff's charge amounted to £273, of which sum the defendant paid £150, being at the rate of 1½ per cent. on the builder's tender.

It may be mentioned that the architect, Mr. Gregg, was subsequently added as one of the defendants in the suit, and that the plaintiff included him, inasmuch as some of the services rendered were said to be architect's work. To this Mr. Gregg replied that the work was done without his authority, and was quite unnecessary. He only employed the plaintiff to do the customary work of a quantity surveyor, acting as Dr. Barnardo's agent. Many leading London architects and surveyors were called, and the hearing of the case occupied three days. The jury, after deliberating, found a verdict for the plaintiff against Dr. Barnardo for £68 7s. 1d., and against Mr. Gregg for £38 17s.

The reports of the case are meagre, and do not furnish all the particulars necessary to enable us to speak with certainty of the legal aspect of the question. It is well known, however, that an architect who is retained to prepare plans and specifications has an implied authority to employ a surveyor to take out the quantities as agent of the employer. This authority has been confirmed in some instances. The celebrated case of "Moon v. Guardians of Witney Union," is known to all architects and surveyors, and up to a certain point is on "all fours" with the facts reported. The main difference is that the Union, by its own act, refused to allow the building to proceed, and objected to pay for the quantities, whereas in the present case the defendants relinquished the original design. There is, however, no question here as to liability, for the defendant paid £150 to the quantity surveyor, which was, he thought, a sufficient discharge of all liability. By this payment the defendant admitted his liability, though not to the full amount claimed.

We have here, at least, a general grievance of the building owner. He very naturally asks why he should be called upon to pay for services that have been rendered of no use to him. He employs an architect to make out plans for a building not to cost more than a certain amount, and surely he thinks he has a right to pay only on that amount for all services rendered in connection therewith. Any charge beyond has been entailed by no word or act on his part, and he very justly thinks he cannot be legally compelled to pay it. But this is one of those cases in which the architect, as agent, binds his employer. We do not know all the circumstances of the case. There might be some grounds for believing that the defendant intended to carry out the first and more costly design, and had subsequently changed his mind. We can only surmise. From the facts as published the conclusion is that an employer is liable to pay the surveyor's commission on any plans, whether they exceed the amount named or not. If we look at the decision from the surveyor's standpoint, we cannot but see the justice of the verdict. The surveyor receives plans and details of a certain building from which he has to take out his quantities, and for this labour he has a right to be paid. If the tenders are too high, the fault does not rest with him: he has done his work and expects remuneration, whether the building is executed or not. A bill of quantities is a laborious undertaking, requiring close attention and thought, and occupying a long time. This labour must be paid for. There is a farther justification. Quantities are the means by which cost can be ascertained. An employer about to build cannot obtain with any approximation the cost without them, nor can his architect, till the plans are prepared. It is unreasonable to expect an architect to tell what a building will cost within a certain percentage. The preparation of quantities may, therefore, be regarded as an essential step which the architect is authorised to take in order to obtain this information. If it sums out at much or little, it is for the owner's advantage, and has, therefore, to be paid for.

The process is a slow, tedious, and thankless preliminary, which it will be impossible to ever make a pleasant one either to the employer or the architect; but the cost must be counted before a building is commenced. At present the question of quantities is shelved till it becomes a matter of necessity. Architects do not like to hint about them, and employers imagine that they are unnecessary, and might be dispensed with, or think the architect ought to be capable of estimating without their use. The matter is one, however, that ought to be generally recognised by employers. In any way, the preparation of quantities must add to the cost of the building, whether known to the owner or not, and the fees usually paid to surveyors generally, however, by the builder ought to be as well known as the architect's own commission. This decision will materially strengthen the hands of quantity surveyors, and increase the responsibilities of the architect. It will point to the importance of preparing designs, with more reference to the cost contemplated. No surveyor can be asked to give his services for nothing, because the tender is too high, and that, therefore, reduced plans and amended quantities have to be prepared. In this instance, the lowest tender exceeded the contemplated cost by £6,000, or more than double, and the surveyor had taken out the quantites to this extent. He was afterwards required to make alterations in the said quantities, owing to the cutting down and alterations of the plans, involving considerable extra labour. To revise a bill is no easy matter; items cannot be struck out, and new ones inserted, as in an ordinary bill of merchandise; each has to be gone into *de novo* from the plans, and the calculation made. Nevertheless, as reductions are often found necessary, an arrangement as to the commission to be charged in amending or preparing a new set of quantities is one of importance. The decision of the jury ought to make architects careful how they arrange for quantities in large works, the actual execution of which seems to be doubtful, lest they be made defendants in the suits. There are facts that are wanting to make this part of the verdict clear. The duties of a quantity surveyor ought to be clearly laid down; he is not called upon to do any of the architect's work—such as finishing the drawings, making details, or tracing, though we have known instances where he has lent a helping hand in these matters, and not only taken out the quantities, but completed the design and drawings, and rendered various services. The public are beginning at last to learn that the erection of buildings entails costs that are not entirely limited to the charges of the architect.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

UNDER the inspiration and leadership that have characterised recent exhibitions of this Society, the winter exhibition opened this week gives every assurance of a continued revival. The collection of water-colours by the late F. H. Potter in the north-west room is not the least interesting portion of the exhibition. These works have been lent by various owners, and they make up a very complete collection. What can be more charming than the girl studies—and they are all of girl life—"The Palm Fan," "The Blue Jar," "Her First Companion," "The Music Lesson," "Laziness"? As studies of colour contrast, "The Palm Fan" (47), a girl in a claret-red dress, and "The Blue Jar," a red-frocked girl holding a blue vase, are admirable in their simplicity and childlike grace. "The Music Lesson"—two girls at a piano—is solidly painted in a dark tone, displaying considerable feeling and sympathetic treatment. The treatment of these water-colours is not the less remarkable for their oil depth of tone and the "stippling" resorted to, the effect of which is to give transparency and an opaline variety to the flesh tints. "Twilight" shows a lady before a fire in a darkened room, the flickering light of the fire and the sombre colour of the surroundings being treated with much poetic grace. "Reflections" is another charming study of child-like simplicity. The other water-colours contain specimens by A. Ludovici, jun., William Collins (75), James Hayllar (77, 83), A. W. Weldon (78), Horace H. Cauty (81), Jules Lessore, T. B. Hardy (82), W. Ayerst Ingram (90), and other artists. In the north-east room, a corner picture, by H. Caffieri, is worth notice. The subject, "Anxiety," represents three female figures, wives of sailors, on a prominent part of the coast anxiously looking and waiting for their relatives. One, a seated figure of a young mother with child in her arms, is weary of waiting. The picture is full of freshness, and the drawing vigorous. Nelson Dawson's "Blowing in from the Sea" (111), Carlton A. Smith's "Family Cares" (137), the fine summer sunset landscape of Stuart Lloyd (146), and S. Giampietri's "Chapel in Westminster Abbey" (152), well drawn and boldly handled in the colouring, are particularly worth mention. In the large gallery the one important picture is by Edwin Ellis, "The King and the Queen, Flamborough" (317), a grand coast scene, in which the gigantic limestone rocks, lit by the sun, rise precipitously from the deep blue sea, set off

against the dark, stormy-looking sky in the distance. The rocks have parted above, forming a great chasm; their magnitude is seen from the boat and wreckage introduced into the foreground. For technical qualities, fine colour, and powerful, solid handling, this work of Mr. Ellis is not surpassed. In singular contrast is Claude Monet's "Coast of Belle Isle, Bretagne" (212), a rock-bound coast painted with an utter disregard of aërial perspective, in every conceivable hue of the rainbow. This impressionist painter has certainly a blind infatuation for the sensational in colour, as the staring, garish landscapes in another part of the gallery attest. "The Birth of Venus" (341), by William Stott, of Oldham, is hardly the ideal visionary beauty which we read of in Greek mythology as having sprung from the foam of the sea, at least in the face; the treatment, however—a circular canvas—and the figure-drawing and colour are decorative, and in better keeping with the poetical legend, for the mythical theme has its own laws. Theodore Roussel, in "Bathers" (207), has produced a nice study of colour. Hayne King's "Resting" (210) and R. J. Leigh's "In Summer Time" are good. A very large landscape, "A Summer Holiday in the South of England," by A. F. Grace, puts one in mind of the undulating pastures or downs of Sussex. The sea in the distance, and the windmills in middle distance; but the foreground is wanting, and the canvas looks rather barren. W. Christian Symons sends a pleasing picture of a little girl with a Christmas tree; Wyke Bayliss gives a view of Evreux Cathedral from the Lady Chapel (230), and further on a more interesting interior, in all the rich play of light and colour for which this architectural painter is noted, representing a group of villagers attending a shrine in St. Madeleine, Troyes. Troyes Cathedral, with its wealth of carving and colour, presented a good field for the display of the poetic quality of Mr. Bayliss's pencil. Another contribution is a clever drawing of "Westminster Abbey from the North Aisle of Choir" (187). Alfred Hartley has a small sketch in oil of a sunny meadow, "Summer" (237), and Yeend King a charming piece of woodland, with two sisters seated at the foot of a tree, "Lessons Out of Doors" (239). We pass works by Henry J. Simpson, J. J. Shannon (a clear portrait), A. Ludovici, jun., "Kept In," a schoolroom somewhat commonplace in treatment. Peter Macnab's "Mussel-Gatherer" (262) in its colour and tone is worth notice. At the corner of room hangs a full-length portrait of "G. S. Willard, Esq." (266), by Sidney Starr, good in pose, but intensely black, with the same lugubrious background and frame. E. J. Cobbett contributes two works. "A Sandy Pathway, Surrey" (272), is natural and effective. Alfred Stevens, in his two studies of morning and evening effect, "Effet de Matin" and "Soleil Couchant" (273 and 280), has shown ability in producing sunlight effects. The latter is a red sunset. Other effects of light, like No. 283, are exhibited; but we pass on to notice Theodore Roussel's fine portrait of Dr. Howard Stewart (293), which bears traces of Whistlerian influence. The President's (J. Mc N. Whistler) contributions are few. "A Red Note—Fête on the Sands, Ostend," is an impression merely, and those who can see the poetry of faint impressions of light and shadow will find something in it, and also in the collection of etchings on the staircase. "A Grey Note" (235) is another example of Mr. Whistler's eccentric genius. Few can see much in his "Symphony of White and Red" in the south-east room (352)—a garden with two or three female figures, and one must look at it from a little distance and by itself to discover the grace of line and colour harmony. Of other pictures in the large room we note Edward R. King's "Village Street, Harting" (204); A. Ludovici's stage fairies behind the curtain in a theatre (306); E. G. Gerardot's "Here's Papa"; Charles Thorneley's "On the Scheldt" (311)—nice in tone; James E. Grace's delicately-painted piece of woodland (315); and Eliza Armstrong's "Matinée Musicale" (316)—a boy at a cottage window playing the accordion to two girls. R. J. Gordon's "Hard Hit" is clever and a trifle dramatic in its action (362)—probably it tells the tale of a betting man. The figures are at least carefully painted, and the colouring and light background well put in and effective. The south-east room is chiefly given up to studies, more or less finished, and to impressionist pictures like those of Claude Monet—one a meadow (375), with trees, representing a somewhat misty effect, the "loading" of pigment being extravagant. Light in its brightest aspects is supposed to be studied in this and the other piece, "Village of Bennecourt" (384), where one sees only a few tall stems of trees of bright rose tints, as straggling as the dark shadows they throw on the sunny meadow. J. E. Blanche has a rather crudely finished sketch of a head (345). E. Aubrey Hunt's "Gathering Seaweed" (350) has a nice harmony in grey tones, and the atmosphere and boats are effective. Another grey study is "Lisiere de Bois," by W. B. Tholen. Theodore Roussel's portrait of Mrs. Mortimer Menpes (316), a full length figure of that lady in black velvet dress on an Indian red ground—"a note in black and red," to use a Whistlerian phrase is one of the chief works. Between the grey subjects of W. B. Tholen and P. W. Steer (364) the red contrasts well. G. F. Whetherbee's "Seaward," and works by G. Demain (407), G. P. Jacomb Hood (414, 425, 426), Jas. Hayllar (429), Mark Fisher (440), Edward Holmes (431), A. W. Weedon (479), are worth notice, and also Solomon J. Solomon's capital portrait of "Prof. Gaetz" (454). E.W.Waite's coast subject, "Daddy's Boat" (441), is pleasingly painted. However sketchy and crude some of the pictures are, they are by a class of artists who are seeking to embody ideas that till lately were refused admission into picture galleries of the conventional standard, and their presence gives zest to the exhibition.

INSTITUTE OF PAINTERS IN OIL COLOURS.

THE present show of oil pictures is strong in landscape and *genre*; perhaps, on the whole, we may be inclined to think there is a little too much of the "padding" element. The council are evidently still of the opinion that the walls must be filled, and a large discount must therefore be made of the pictures of merit. In the West Gallery landscape holds a high place, and the picture of Stuart Lloyd, "Moonrise" (12), with its summer haze and sunlight passing into moonlight, the fine colour and reflection on water; Tom Lloyd's "May Morning" (18)—a delightfully-painted hillside overlooking the sea, with a tree bent in the breeze; Claude Haye's "The Hammer Ponds, Godalming" (73)—a grey-toned heath; James Webb's "Salisbury after the Floods," despite the ill-proportioned spire; and E. M. Wimperis's "Ferryman's Cottage" (119), are sufficiently important contributions to make a small gallery. Figure and incident studies are numerous; perhaps one of the cleverest is by G. G. Kilburne, jun., "Just Too Late," an incident of old days, told with his usual minuteness of detail. C. N. Kennedy (3) paints a small classically conceived picture with figure of refined colour. Stanhope A. Fisher's "He Won't Bite" is not without pathetic interest, and the grey colour and children are natural. J. J. Shannon's centre study of portraiture, "Mrs. Thornton" (69), dressed in light pink, is admirable in its technical qualities, though somewhat prim in pose. The most pretentious figure subject is the Hon. John Collier's "A Priestess of Bacchus," an ivy-crowned figure holding a rod with fir cone, standing amid rocks—a composition that is at least bold in its conception, and painted with the master's careful attention to background and detail. John R. Reid's Miss Nelly Tate as "Alice in Wonderland," is clever as a piece of brushwork and colour; but the expression is not happy. H. Fantin's "Sara la Baigneuse" (162) is not without merit as a composition, but decidedly lacking in delicacy of treatment. A small study of "Hero," by George Morton, is delicate and refined in colour; the beautiful maiden of Sestos is shown looking through a curtained doorway, her hand screening her eyes. Oscar Wilson's "Idling" is a clever piece of technique; and Arthur Severn's "Santa Maria della Salute, Venice" (201), G. G. Kilburne's "After the Ball" (196), J. MacWhirter's "Shores of Arran," Miss Rosa Jameson's "A Vanishing Sail," and works by J. T. Nettleship, and L. R. Hill (34), the humorous pictures of ducks, by J. C. Dollman; "Those the Gods Love Die Young" (136), and one by W. Dendy Sadler, in his usual vein, an incident of monastic life, may be mentioned. F. Walton's "Hill Top" (128), is exceedingly true to nature, and solidly painted.

Sir James D. Linton, the president, sends one work, a head, "Henriette," refined and scholarly as usual, but rather inanimate. It is a strict profile, Holbeinesque in style and technique, with a fine nose and mouth. The opposite wall and picture to which the accustomed visitor generally looks for the next work of the year, has F. D. Millet's "Piping Times of Peace" (454), a work of undoubted excellence, depth of tone, and finished execution—the interior of an inn, in which a merry-making musician, with broad-brimmed hat and collar, is piping to a customer and the comely-looking hostess. There is much that reminds us of the minuteness and chiaroscuro of the Dutch painter—a softness of colouring, and an accurate drawing of detail, as in the fine flat-pointed arched stone chimney-piece and the massive dark polished table. John Fulleylove shows almost as much skill with his oils as he does with the water-colour pencil; but there is a difference which does not as yet enable one to say that the master of architectural landscapes and stately garden scenes succeeds so well in oil. The delicate handling is lost in the heavier medium, and much of the architectural interest also. His "Hampton Court Palace," showing the majestic walk and statuary and the rounded foliage, is characteristic of the artist's work; and the same praise can be awarded to the view of "Blenheim Park and Palace" (477). "A Contrast," by Hugh Cameron, R.S.A. (222), is a telling incident; the atmosphere and sea in Gustave de Breanski's "Storm Clearing Off" (231), the delicate tone and sentiment in Jas. E. Grace's "Under Hanging Boughs," David Murray's clever little bit of sunlit meadow, "A Bait" (210), "Sir Roger de Coverley and the Beautiful Widow," by W. P. Frith, R.A., the fine luminous colour in Miss Hilda Montalba's "Grey Day, Venice" (268), F. Roe's "Old Sun Inn, Ipswich" (314), with its plaster ornamentation between casements, are interesting. Dexterous handling and broad effect are qualities in Alfred East's work, "The Gate of the Trossachs," and in two other works.

J. J. Shannon's studies of portraiture (178) and "Florence" (328), are examples of graceful dignity and refined colour. His portrait of Mrs. Thornton, to which we have referred, is a contrast in colour to Lady Maude Hooper in a slate-coloured satin; the former lady is extremely young and girl-like. The three portraits raise high expectations of this artist's talent as a painter. "Une Matinée Musicale," by E. Blair Leighton (337), is a scholarly work, in which the costumes and

ceremonious habits of the 18th century have been painted with dexterous minutiæ and regard to detail. Frank W. Topham's "Two's Company, Three's None" (338) is also a cleverly-told story. James Hayllar, in his young girl, seated on a couch, attired in lace dress and silk stockings, aptly illustrates the lines—

"Ribbons and laces, and sweet pretty faces,
And that's what young ladies are made of."

"The Fortune Teller," by G. Hare, is weird, but not pleasant. Ernest Bucknall's landscape, "Autumn Days" (367), is broad and well painted; after which we come to W. Dendy Sadler's "The Private Secretary" (383), in which the painter has depicted an incident with great skill and with much of the comedy element about it. Equally successful is "In Summer Time" (403)—two jovial priests dining together under a verandah. John White has three subjects in his usual pathetic mood, and warmth of colour. "Home," a cottage scene, with its glow of evening sun on the faces of the three figures at the doorsteps, is full of pathos.

The East Gallery is generally one of the strongest. The first picture to strike us is the bright green seascape of Edwd. F. Brewtnall (529); the curling wave, as it is coming in, with the receding water is cleverly painted, and the lights and reflected lights are well managed. Humorous and clever is Arthur Dodd's "An Idle Threat," a magpie seated on a tub amongst a lot of dogs, threateningly holding a whip in his beak. Clegg Wilkinson's "Spring—Piccadilly" (538) is a large grey picture, powerful in its pathetic interest, though very simple in its elements. Henry J. Stock's "Satan Dead at the Foot of the Cross (557) is a bold conception, if we cannot say the painter has done the best in its presentment. T. B. Kennington is less happy in his "Pleasure and Pain" (571), a rather commonplace composition—a lady in ball-dress attire in her drawing-room, listening to the sad tale of a sister in woe, who sits beside her in deep black, weeping. "A Modern Sibyl" (707) is clear in its light and shadow. The chief work in this gallery is, without doubt, Solomon J. Solomon's "Remorse," a very powerful picture representing (if we may surmise from the type of Eastern beauty who leans back upon a leopard's skin with a half-scowling look on her well-chiselled features) Delilah, and intended as a companion picture to Mr. Solomon's great work of "Samson" in last year's Academy. Here, at least, we find similar accompaniments—a glistening robe, long black tresses of hair, restless penetrating eyes, and surroundings that bear the same idea. The painting is tragical in the extreme, and its qualities of depth of tone and harmony of colouring and technical resources considerable. J. Haynes Williams' fine study, "The King's Page," is a delightful contrast to the last picture—a sleek-looking young man, satin-shoed with striped satin tucked-in tunic, carrying a flagon on a silver waiter. John R. Reid's strange study of "Old Batten's Farm," a harmony in reds, in which the trees, cottage, and faces are glowing in warm colour, hangs in a prominent place. More pleasant and natural in colour is Keeley Halswelle's "Autumn" (650)—a sequestered brook shaded by woods in autumnal shades, a little out of this painter's beaten track. We look in vain for another Halswelle this year. Owen Dalziel's "The Sands"—a crowd of holiday-makers on the beach, full of bright colour and life; and Arthur Hacker's "Returning from the Cockle Grounds" (630)—a grey-toned picture—are both noteworthy as opposite ideals of seaside life—one pleasure-seeking, the other of hard labour. Cyrus Johnson's "Catechism" is a clever piece of church detail, the carved pulpit and bench ends are of more interest than the subject proper; the portrait of Mrs. Cuthbert Williams is light and graceful, by Miss F. White. Ernest Parton's "Autumn's Sunshine"; R. Gallon's "Rising Mists" (687); E. M. Wimperis's fine landscape in the New Forest (709); Adam E. Procter's "Tide Waiter"; Edwin Haye's large and fresh "South-West Wind and Ebb Tide" (718), admirable in colour and atmosphere; G. Chester's vigorous "River Farm" (722); Edward Hargitt's large landscape, "Parkstone, Dorset" (750); H. R. Steers's "Indecision and Interest" are works of decided merit, to say nothing of many lesser works of *genre* and interest which adorn the walls.

THE SOCIETY OF ARCHITECTS.

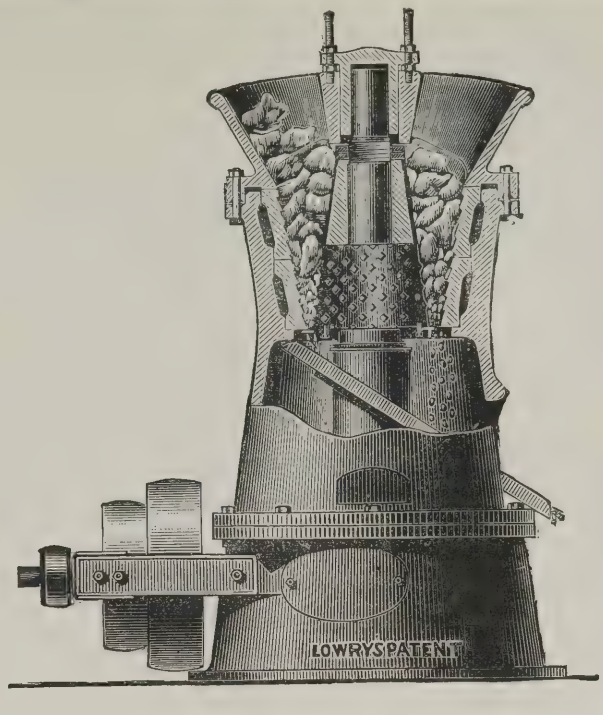
THE second meeting for the present session was held on Tuesday evening at the Society's rooms, St. James's Hall, Piccadilly, S.W., Mr. C. H. Searle occupying the chair. The following thirty-nine gentlemen were elected as members:—Thomas Henry Baker, Walbrook House, Clacton-on-Sea; Alfred Joseph Beesley, 9, Buckingham-street, Adelphi, W.C.; John Brockbank, City Architect, Norwich; Joseph Cardona, jun., Gibraltar; William Crozier, jun., Old Elvet, Durham; Adolphus Curry, "The Retreat," and 21, Halkett-place, Jersey; John Richard Davison, Elmdale, Frances-road, Windsor; William Drew, 22, Victoria-street, Swindon; Owen Edwards, Alpha Villa, Rhyll, and Llewelly Chambers, Llandudno; Frederic Foster, Euston-place, Leamington Spa; Edwin James Hamilton, 70, Ship-street, and 13, Wellington-road, Brighton; Jacob Emlyn Harvey, 15, Clifton-hill, Exeter; Charles Joseph Higgins, 9, Buckingham-street, Adelphi, W.C.; Frederick Henry Holdsworth, Florence-road Chambers, New Cross, S.E.; Percy Holland, Fairstead Cottage, Newmarket; John Jackson, Woodland-place, Long-row West, Nottingham; Richard Thomas Johnson, 129, Darlington-street East, Wigan; Sydney Herbert Meyers, The Lindens, Brentford, Middlesex, and 83, Queen-street, Cheapside, E.C.; Frederick Morley, Commercial-buildings, Dublin; John Philip Mumford, Llanrug, Carnarvon; Philip Munro, 2, St. Stephen's Chambers, Baldwin-street, Bristol; William John Musgrove, 6, Flora-place, Union-street, Plymouth; William Bayne Parnell, Chalton Cottage, Arundel-place, Landport; Henry Walter Phillips, 10, Thomas-street, Horsely-down, S.E.; Sydney Kelway Pope, 1, High-street, Lymington, Hants; Henry Goodall Quartermain, The Oriels, Kingston-road, Merton; John Rhind, Inverness; William Rickwood, 243, Burrage-road, Plumstead; John Murray Robertson, 33, Albert-square, Dundee; Thomas Frederick Shaw, 1, Fortune Gate-terrace, Harlesden, N.W.; John Simpson, 8, The Quadrant, Buxton; Douglas Stewart, Dunkeld, Dean Park, Bournemouth; John Walden Stroud, Elm Grove, Southsea; Benjamin Turner, 10, Pitt-street, Barnsley; Robert Walker, Windermere; Joseph Frederick Walsh, Waterhouse Chambers, Crossley-street, Halifax; Walter Albert Williams, 51, High-street, Bromley, Kent, and Budge-row, E.C.; William Williamson, 3, Low-pavement, Nottingham; and Joseph Yeardye, 108, High-street, Ilfracombe.

TECHNICAL EXAMINATIONS.

The following paper was read by Mr. G. A. T. Middleton, A.R.I.B.A., secretary:—All examinations divide themselves naturally into two groups—those in which a certain proportion of the total number of marks has to be obtained in order to secure a "pass," and those in which a certain position among the candidates (first, second, third, or fourth, as the case may be) has to be reached in order to secure a "post." We have examples of both these classes in the examinations relating to architecture. On the one hand, we find those of the Science and Art Department, the Associates' Examination of the R.I.B.A., those to qualify for district and local surveyorships conducted by the same body, the entrance examinations of the Surveyors' Institution, those for local surveyors and inspectors of nuisances held by the Sanitary Institute, and those for municipal surveyorships held by the Association of Municipal and Sanitary Engineers and Surveyors; while, on the other hand, are all the examinations of a technical nature which are conducted by the Civil Service Commissioners. When commencing his studies an aspirant who intends to become an architect cannot do better than join the classes which are held throughout the country under the Science and Art Department. Before entering the office of an architect at all he would do well to become sufficiently accustomed to the use of his pencil to be able to pass the second grade examinations in freehand and model drawing, geometry and perspective. The first two of these subjects can be easily taken up by a boy who has been at school under a good drawing master before he is 17 years of age. The geometry is also very simple; but it is to be doubted whether the system of perspective drawing taught under the Science and Art Department is the best. To understand it properly, a very considerable knowledge of solid geometry is required, while all architects know that for practical purposes it is much easier to do a perspective by projecting from the plans than according to the theoretical rules. During his first year of articles a pupil should, and generally does, attend elementary classes in building construction and solid geometry, and these are followed up later on by passing in the advanced and honours stages. By these means a really sound knowledge, both of ordinary construction and of the materials used upon building works, can be obtained, for, in order to pass, it is not only necessary that the candidate should read books bearing upon the subject, but he must have visited works in progress, and must have become a neat and accurate draughtsman. For the honours stage in building construction, it is also necessary that a small design should be got out, together with a specification of estimate. Here, however, there is a decided flaw in the syllabus, for the design is allowed to be done at home, and consequently, while one candidate is able to spend the whole three weeks which are allowed upon the drawing, another would only be able to give to it one or two hours each evening. The result naturally is that the best man does not always succeed the best; while most of the candidates being employed in the daytime have to hurry their work, and the specification, at least, is generally sent in in a very rough form. Would it not be better to hold a second exam. in design for this, to pass in which some simple building would have to be pencilled out in the course of the four hours that would be allowed? It is not wise for an architectural student to remain in the art classes for the 3rd grade exams. The work done there is generally of too precise and mechanical a type for anyone who has real artistic ability, and the time is very much better spent in gradually preparing for the Associates' exam. for the R.I.B.A. This should be taken as soon as possible after the expiring of the articles, as before the student has entered the office of an architect as a paid assistant he has generally more time for study than afterwards. The amount of study required is considerable, and the exam. is, in some subjects at least, severe. The idea of attempting probationary drawing before the candidate is admitted to the exam. is a very good one. Here, above all other places, is the opportunity to test a candidate's ability as a designer and draughtsman. The papers upon Architectural History and Ornament are generally difficult to answer; still, they should not be beyond the capacity of anyone who really means to make architecture his profession. Ths subject set for the design is usually too large and complex to be worked out in the six hours that are allowed for its execution. In the Civil Service examinations it is a common thing to allow four hours for some such subject as a small stable, or a cottage hospital, of which the plans and elevations are required in pencil; but this is much more easy of accomplishment in the time, difficult as it is, than is the planning of a large board school to accommodate 300 children in six hours. The papers upon Material and Construction are simple, and should be easily answered by any who have previously gone through the advanced stage of the South Kensington Building Construction examination; in fact, no more is asked for than it is absolutely necessary that every architect should know. The same may be said of the Specification paper, and the questions upon Professional Practice; but those

set upon Strains are, to use a mild expression, absolutely valueless. It would be much better to leave the subject alone altogether than to set questions which any boy of 14 years of age, with the smallest knowledge of algebra, could answer. The examiners seem to have an idea that the subject is merely one of formulæ, which architects can find by looking up in their hand-books, instead of its being a branch of statical science, founded upon the closest mathematical reasoning combined with a knowledge of the strength of the different materials to be employed. It may be said generally that the R.I.B.A. examination is one which all architects should be able to pass whether or not they be naturally artists. It is, however, certain that the artist stands a much better chance of success than the purely practical man. No one, in fact, should be allowed to practise unless he pass. A great deal of credit must be given to those who inaugurated the exam., both for the lines upon which it was originally drawn, and for the great improvements which have taken place in it during the last few years. As a general rule the failures amount to about 25 per cent. of the candidates, a proportion which sufficiently shows the amount of work which the junior members of our profession voluntarily go through in order to qualify themselves for the examinations which are held by the R.I.B.A. For the examinations to prove the qualifications of candidates for district and local surveyorships, two very different sets of particulars are issued. One of these consists of some four or five heads and is issued to candidates on application, while the other consists of twenty heads, and is published in the R.I.B.A. Kalendar. This is a great mistake, for candidates hardly know what to read. As a matter of fact, the exam. is of a most miscellaneous character. The different Acts of Parliament relating to surveyors' duties in London and in the provinces supply the greatest number of questions; but beyond this, a knowledge of almost every branch of a house surveyor's business is requisite, while architecture is very properly not touched upon at all. These may well be considered the most severe qualifying examinations that are held, especially when we consider that the number of failures ure very far indeed in excess of the number of passes. The Surveyors' Institution has a very complete scheme of entrance examinations in three sub-divisions, so that candidates may enter by either passing in Land Agency, Valuation, or Building. There is also a preliminary examination for the admission of students; but this is not of a technical nature, and it is not necessary to go through it before entering the class of Professional Associates. The examination throughout is of a very practical and searching character. Land surveying and book-keeping have to be taken up in all three sections; but beyond this they vary very much, those taking up land agency being expected to be proficient in the law of landlord and tenant, in agriculture, in the construction of farm buildings, land drainage, and geology; those who take up valuation, in the law of landlord and tenant, and several legal subjects; and those who take up building, in construction, quantity surveying, measuring, working drawings, and the law of fixtures, dilapidations, and easements. A large number of candidates enter for this examination annually; but the proportion of passes is by no means great, while very few proceed further for admission into the class of Fellows, for which there is another examination of a considerably severer character, upon much the same lines. In every way these examinations reflect the greatest possible credit upon those who manage them, and no better qualifying examination for gentlemen entering the surveying profession could possibly be found. The examinations held by the Sanitary Institute for local surveyors and inspectors of nuisances draw but a small number of candidates. In all probability it is because small value is attached to the diploma gained by the members of local boards, consisting of non-professional men, who have the eventual filling of these posts, rather than to the character of the examination, although the latter is too short to properly test a candidate's qualifications. A great deal of study has to be done, however, before candidates can pass, as the field covered is a large one; but, still, it is not possible to test a man's knowledge of a large subject by giving him one question thereon, and this, if not absolutely the fact, is something like what is done by the Sanitary Institute. A similar examination, held by the Association of Municipal and Sanitary Engineers, is drawn up on much better lines. The subjects are: (1) Engineering as applied to municipal work, including land surveying and levelling, hydraulics, drainage, and sewerage, water supply, and road making; (2) Building Construction and Strength of Materials, including a knowledge of materials, the construction of public and private buildings, and of building by-laws; (3) Sanitary Science, as applied to towns and buildings, including ventilation, sewerage, and house drainage; and (4) Public Health Acts and the Rivers Pollution Acts. This examination has not been established for many years, nor has it been very widely advertised, and, therefore, is not so well known or appreciated as it deserves to be. It is held in the rooms of the Institute of Civil Engineers, and to this fact is most likely due the erroneous idea that examinations are held for admission into that Institute. This is an entire mistake, for there is at the present time no examination whatever, of a qualifying character, by which young engineers can test their qualifications, and in preparing for which they can find incentives to study, such as young architects have in the R.I.B.A. examination. The second great class of examinations appeal to a much smaller circle than those of which we have been speaking. Posts in the Civil Service are only sought by gentlemen who cannot succeed well as architects or surveyors, or who have not the means to start a practice. A certain competency and very passable social position is to be gained in the Civil Service with a fair income for life; but against this is to be set the "red tapeism" to which anyone of an independent spirit would not submit. When clever and naturally independent men enter the Civil Service, as they sometimes do from the easy life which it appears can be led in the Civil Service as compared with the hard work of making a living in the outside world, they soon either throw it up in disgust or else become mere machines like those around them. There are exceptions, of course, but they are rare. One great distinction between the Civil Service examinations and those instituted by professional bodies, besides it being not only necessary to pass, but to be sufficiently high amongst those who pass to obtain a vacancy, is the fact of there being a preliminary examination to go through. Although this is limited to such subjects as elementary arithmetic, handwriting, dictation, and composition, yet by the time that candidates have obtained a sufficient technical knowledge to enable them to compete, they have forgotten so much of their general education that it is quite a common thing for 50 per cent. of the candidates to fail, and it is also noticeable that the best and most artistic men are found to be the least successful. Several instances can be cited of gentlemen failing in their Civil Service Prelim. who have done well and gained high honours in their profession. The most popular examinations are those for Assistant Surveyorships in the Royal Engineers. Before entering for this examination it is necessary that candidates should have spent at least three years in the office of an architect, civil engineer, or builder, and some similar qualification is generally required in all the other departments. The subjects include (1) either architectural drawing, engineering drawing, or builders' details, at the option of the candidate; (2) theory of construction; (3) knowledge of materials, description of workmanship, tools, and plant; (4) quantities; (5) analysis of prices; together with algebra, Euclid, trigonometry, geometry, freehand, and chemistry of building materials, which it is in the candidate's option to take up or leave alone. As at the last examination, there were but three marks between the 8th man, who obtained a place, and the 9th, who did not, so that it is very evident that all the subjects should be taken, if possible. It will be remarked that a great deal more attention is paid to quantities and to mathematical matters than to anything directly connected with architecture, and it is usual to find that the best places are taken by men of a mathematical turn of mind. Next in popularity to the above are the examinations for assistant surveyors in the Office of Works, and for draughtsmen in the Admiralty. A strange injustice in this examination has just been brought forward. The limits of age in the Admiralty are 24 to 30; those for assistant surveyors in the Office of Works 21 to 30. The subjects of examination are identical; but the Admiralty posts are considerably more valuable than those in the Office of Works. It is, therefore, quite possible, and, in fact, it has happened, that a man whose age is between 21 and 24 has come out high in the list, when examinations have been held for vacancies in both departments at the same time, but on account of his being too young for the Admiralty he is obliged to put up with a post in the Office of Works, those who have done worse than himself in the examination thus obtaining better posts. The examination differs from that of the R. E. in the architectural and engineering drawing and builders' details being compulsory, together with specification writing and sanitation; but the mathematical subjects are not so severe. To the voluntary subjects are added a knowledge of surveying instruments, and one modern language. Vacancies in other branches besides these are both few and very far between; but junior examiners of builders' accounts are occasionally wanted in the Office of Works, for which post the examination is by no means a difficult one, though its very ease draws a very large number of candidates together, and the result is a most severe competition. Occasional vacancies also occur in some Irish offices, and an examination will be held shortly for one of the best appointments ever offered in public competition—viz., that for a surveyor of buildings in the Public Works Office, Ireland, commencing at £400 a year. The age limit is high (30 to 35), and it is necessary that candidates should have been engaged seven years in some profession connected with building operations—five of which must have been served in the office of an architect of acknowledged reputation, and three of these have been passed in Ireland. The examination itself is of a most satisfactory nature, so far as can be judged by the syllabus issued, comprising as it does design, construction, strains, quantities, specifications, sanitation, geometry, algebra, mechanics, surveying, and a modern language. Of course, it is not necessary that a candidate should qualify in all these, but he must do so in the majority of them. There are some other valuable appointments, and among the best are the county surveyorships in Ireland. The age limit is from 26 to 40; the subjects of examination are so exceptionally severe that none save first-rate mathematicians should enter. They include the construction of heavy engineering works, both on land and by the sea, with a thorough knowledge of mathematics, including the integral and differential calculus, and of physics generally. In all these Civil Service examinations it is to be noticed that the work to be done in the office by the successful candidate is of a most elementary description, compared with the work he has had to do in making himself efficient. Good men are certainly secured to the Government by the system; but it is much to be doubted whether before they are called upon in comparatively old age to take a responsible position or important work upon their shoulders they have not forgotten all they learnt in earlier years, which would have enabled them to have undertaken it. It may be considered a general maxim that while the pass examinations held by professional bodies tend to a healthy and gradually acquired knowledge, the various competitive examinations of the Civil Service Commissioners lead to over-strain, and a system of rapid cramming which is a disadvantage both to the candidate's mental growth and to the service which he eventually enters, especially if he does not think of entering until the post is advertised. Of course, those who wisely enter upon a long course of study stand a much better chance of success than those who attempt to crowd into a few weeks as much reading as should properly occupy a year, and then enter the examination with a feeling of confidence in their knowledge to which the others are perfect strangers, besides having laid up for themselves, even in the event of failure, a mass of information which is certain to prove of the utmost benefit to them in after life.

The Chairman urged that in an architectural examination far more importance should be



given to construction than to design. The system of training architects' pupils adopted a quarter of a century since of sending them for two or three years into a builder's workshop had great practical advantages, but there was no time to spare for such a course in the present day.

Mr. Alexander Pilbeam proposed a vote of thanks to Mr. Middleton, and added that if a pupil could get a year or two in a builder's workshop it would be most beneficial. For a youth who contemplated an all-round practice the joiner's bench would be the best department, while one who intended to do church work should go as a mason's banker.

Mr. G. H. Guillaume seconded the motion, and observed that the chief benefit of workshop training was that it gave the future architect a practical acquaintance with tools and methods of working, and a power to detect whether work was well or ill done and where a fault had been committed.

Mr. Middleton briefly replied, observing that it was to be regretted that in the R.I.B.A. examinations candidates were expected to answer every question, and not as at South Kensington, directed to answer only a certain proportion of those set. By the latter plan a candidate concentrated his attention on those in which he was most proficient. This system could not in fairness be adopted in competitive examinations, as it favoured the specialist rather than the all-round student, but he thought as a test of qualification it was the better plan. It was to be regretted that at the R.I.B.A. examination the artistic side was severe, while the constructional, and especially the mathematical, questions were so easy that hardly anyone could avoid passing. He held that it was better for an architect's pupil to remain in the office and visit works in progress as often as possible, than to spend some years in one branch of a builder's workshop.

LOWRY'S CONTINUOUS GYRATORY-ACTION STONE BREAKER.

We feel quite sure that Lowry's continuous gyratory-action stone breaker, of which we give an illustration, will entirely supersede the ordinary jaw-crusher machines now in use, whether the efficiency of the machine, the power required to drive it, the cost of labour to work it, or the cost of repairs are considered. These machines have extraordinary crushing power, and are simple in construction; and although neither ponderous nor unsightly, are very substantial in appearance, and possess every mechanical feature to render them both powerful and durable. They are not subject to the strains of crushers with flat crushing faces, as their circular form causes the stone or other material to bear on its outside edges, leaving a hollow behind when the impact or blow is given, thus realising a proper distribution and consequent reduction of strain. The shaft does not revolve or vibrate, but gyrates; and by means of this gyratory motion and the circular form of the crusher surfaces, the principal feature—i.e., the cracking action of the machine—is obtained, and the stone is broken without the tendency to split or flake as in all classes of jaw crushers; and a far better quality of production is the necessary result. Although the wearing parts are few, and the framework strong, the machine is designed with all due consideration to future repairs, and every part is easily accessible, and can be readily duplicated or renewed as time and circumstances may require. The machine while in motion may be adjusted to break larger or smaller stones as required. In comparing the gyratory crusher with the older types of machines it is evident that the efficiency or output of the machine will depend upon the quantity of material which can be operated upon in any period of time, and as it is evident the machine will be the most efficient which brings into action the largest effective crushing surface in that time, it is necessary to compare the two systems in this respect. A No. 4 Lowry breaker (size 10in. by 20in.), having a circular crushing head with an external surface of 1,303sq.in., and corresponding annular crusher block with an internal surface of 1,971sq.in., has a total of crushing surface of 3,274sq. in., and making 120 gyrations per minute, will bring into contact an actual crushing surface of 392,880sq.in. per minute. A jaw-crusher taking same sized stone with square-head 16in. by 18in. and a corresponding square crusher block of 16in. by 18in. has a total crushing surface of 576in., and making 250 strokes per minute, will bring into contact an actual crushing surface of 144,000 per minute, thus leaving a proportion (of nearly) 3 to 1 of continuous effective crushing surface in favour of the Lowry gyratory machine. Next as regards the power required to drive the machine. In the Lowry gyratory machine the moving parts are continually going forward in one direction, and by doing work all the time no power is wasted. In a jaw crusher, the motion being intermittent, a large amount of power is absorbed in overcoming the inertia and friction in bringing back and restarting the head for the succeeding stroke; and a machine of this description with a head weighing 15cwt., and making 250 strokes a minute, will necessitate the moving of 187½ tons per minute, or 11,250 tons per hour, the length of the stroke, which is an enormous waste of power. With respect to the cost of labour to work the machine, in the Lowry gyratory machine the material can be tipped into the hopper from the waggon or cart up to several tons; but the jaw crusher requires feeding by hand or spade, which makes a great difference in the cost of working. With the new elevator and screen a cart can be loaded in 4½ minutes without manual labour. And last, but by no means least, we must consider the cost of repairs. This will be greatest when the inherent construction of the machine tends to its own destruction, or the number of parts is so large as to make the same costly; the Lowry gyratory machine not only has the advantage of less than one-half the number of parts of the jaw crusher, but is altogether free from the incessant pounding which is common to these machines, and is essentially destructive to them and their surroundings.

Clerks and surveyors of local authorities are, of course, especially interested in stone-breaking machines, and they are apparently fast adopting the Lowry. At a recent inspection by the members of the Worsbro' Local Board and others at the Old Foundry, Barnsley, the breaking of dross from ironstone furnaces was proceeded with, and it was found that 27cwt. 1qr. were broken in eleven minutes with 3cwt. 3qr. 8lb. of small; while 26cwt. 2qr. 14lb. went through a similar process in thirteen minutes. The results of the experiments were generally considered satisfactory. At another trial, conducted before the Streets Committee of the Barnsley Town Council, hard dross from the works of Messrs. Newton, Chambers, and Company was used, and whilst the first ton was broken in eight minutes, the second ton only occupied five minutes in breakage. This was with hand feeding, and as the machine, in permanent use, is fed in bulk, it is easy to see how a much larger quantity than even 12 tons an hour may be broken.

We recommend all users of stone-crushing machines to send for prices and particulars to the makers, Messrs. James Farrar and Co., Old Foundry, Barnsley.

CHIPS.

A new organ was opened on Sunday which has been placed in St. Mary's Church, Stratford-le-Bow, in memory of the late Mr. William Bangs, builder, of Bow. This is the gift of his widow, and has been erected by Messrs. Walker and Sons, of Tottenham Court-road, London, under the supervision of Mr. Henry Poston, of 39, Lombard-street, who for many years was connected with the late Mr. Bangs in many large and important contracts.

Mr. Waddell, the contractor for the execution of the Mersey Tunnel Railway, has accepted an estimate from Mr. T. W. Helliwell, to do the whole of the glazing and zinc roofing required on Park Station, Birkenhead. Mr. Helliwell did the whole of the glazing on Green-lane, Borough-road, and Shore-road stations, when this railway was opened two years ago.

Mr. Alfred Gilbert, A.R.A., is now at work at the model of the Shaftesbury memorial fountain for Shaftesbury-avenue.

The Kent county magistrates have given Mr. James Hill the order for 450 special locks with master key arrangements for the Barming Heath Lunatic Asylum.

At the weekly meeting of the Metropolitan Board of Works a long discussion arose concerning the Works Committee's recommendation that Mr. Edward Bazalgette be assistant engineer to superintend the works of the Blackwall Tunnel. In reply to the charge of favouritism raised, it was explained that Mr. Bazalgette had prepared the tunnel scheme, and that the present assistant-engineers of the Board were men over 60 years of age, who could not be expected to spend their time in the foul atmosphere of a tunnel. The recommendation was adopted by 30 to 2.

A Bill will be introduced to Parliament next session authorising the pulling down and the sale of the materials, fittings, &c., of St. John's Church, Epping, and the erection of a new church on an enlarged site adjoining.

The marble statue of the seventh Earl of Shaftesbury for Westminster Abbey is now well advanced, and will, Mr. Boehm thinks, be ready for placing in the Abbey some time in January. The likeness is said to be a very striking one, and will be recognised by many as he appeared at the Guildhall on his 80th birthday or a little earlier. Mr. Boehm is now arranging with Mr. Pearson, R.A., the architect to the Abbey, about the foundation for the statue.

A massive drinking fountain and horse-trough, in polished grey granite, has just been erected as a memorial to the late David Kidd, opposite the cab rank at the east end of St. Clement Danes' Church.

OUR LITHOGRAPHIC ILLUSTRATIONS.

CITY CHURCHES.

To-day we give illustrations of four of the more interesting of the City churches—viz., All Hallows, Lombard-street; St. Olave, Hart-street; St. Bartholomew the Great, Smithfield; and All Hallows' Church, Barking. These views are from a very fine series of photographs taken by Mr. S. H. R. Salmon, architectural photographer, of Regent-street, showing all the churches in the City, and forming together a valuable record of these historic buildings. All Hallows, Lombard-street, has been called "the Invisible Church," so completely is it concealed by buildings, and, so far as its exterior is concerned, this is but little loss. The tower, which rises 85ft. and measures 21ft. at the base, is exceedingly plain, and is thin and weak in design, though in composition, it is but fair to add, the structure is better than some other of Wren's buildings. The church was erected in 1694. Its exquisitely carved white marble font, which we illustrate, is well worthy of note, and the church contains some rich woodwork, carved figures of Time and Death, besides a carved curtain, which seems to hide foliage behind it. The stall work is partly seen in the accompanying view. St. Olave, Hart-street, escaped the Great Fire, and comprises work of Norman, Early English, Decorated, and Perpendicular periods. The interior, consequently, is very interesting, with an arcade of pointed arches and clustered columns. Pepys, who lived in Seething-lane in a house belonging to the Navy Office, he being Naval Secretary (temp. Charles II. and James II.), and subsequently resided in Hart-street, makes several mentions of it as "our owne church." He was buried here at nine at night "by ye Communion Table," June 4, 1703, "just under my mother's pew"; and there is a monument to his beautiful but troublesome wife in the chancel. There are also several figure tombs and brasses, and a marble figure of Sir Andrew Riccard (d. 1672), who bequeathed the advowson of the living to the parish. John Orgone and Ellyne his wife have a monumental brass, with the quaint verse—

> "As I was so be ye,
> As I am you shall be;
> That I gave that I have,
> That I spent that I had.
> Thus I ende all my cost,
> That I left that I loste."—1584.

St. Olave's was repaired in 1863, and Sir G. G. Scott, R.A., erected a poorly-designed Caen stone reredos with panels of alabaster. There are six bells in the tower, which date from 1662 and 1694. The dedication is to a Norwegian, who came to England and fought on behalf of Etheldred II. against the Danes. Being himself afterwards made King of Norway, he became a Christian, which irritated his subjects, who invited Canute to supplant him, by whom he was defeated and slain in 1028. Several churches are dedicated to him in England, and three in London, on account of the assistance he had given to the Saxons against the Danes. The view here given shows the new altar rail, above which to the left of the holy table is the curious monument of Andrew Bayninge, 1610, and Paul Bayninge, 1616, aldermen, with an epitaph, which tells how—

> "The happy summe and end of their affaires,
> Provided well both for their soules and heires."

The gateway leading to the church looks out upon Seething-lane, and is surmounted by a singular chevaux-de-frise of ancient ironwork. It is often called the "Gate of the Dead." St. Bartholomew the Great, Smithfield, is too well known to need description. The founder's tomb (Rahere, the first Prior) is seen in our photograph, with its beautifully-groined canopy. At the foot of his sleeping figure stands a crowned angel, and on either side kneels a monk with a Bible open at Isaiah li., and the words "The Lord shall comfort Zion: He will comfort all her waste places: and He will make her wilderness like Eden, and her desert like the garden of the Lord; joy and gladness shall be found therein, thanksgiving and the voice of melody." The structure is of 15th-century date. All Hallows, Barking, at the east end of Great Tower-street, is so called from having belonged to the abbot and convent of Barking, in Essex. The church contains a curiously-carved altar, font-cover by Gibbons, and screen, with altar wreaths, and some fine brasses of early date, among the best in London. Much of the building, which escaped the fire, is Perpendicular in date, with earlier re-insertions; but the church was founded by the nuns of Barking Abbey before the reign of Richard I., who added a chantry in honour of the Blessed Virgin north of the chancel aisle, and called "Berking Chapel." The celebrated sword-rests of three Lord Mayors, the last 1727, fixed over the Corporation pew, are seen in our view, and so is the pulpit. The tombs of this church are of special interest.

ST. GILES, WREXHAM.

The church, dedicated, according to some authorities, to St. Giles, but according to others to St. Silin, was rebuilt, with the exception of the tower, in the reign of Edward IV., and again restored in the year 1867. Of the earlier edifice, its style and character, little is known, but that it stood on the site of the present one and terminated where the chancel arch proves, by the remains of its ancient tracery, the old east window to have been. "In some old accounts I have seen of this town in the Welsh chronicles," writes Brown Willis, "the steeple is said to have been cast down on Nov. 25, 1330, and the market day changed next year, anno 1331, from Sunday to Thursday, as it now continues, and that the town was burnt anno 1463." Other authorities state the church to have been burnt down in 1457, and in order to promote the rebuilding of it an indulgence of forty days for five years was granted by the Pope. The family of Llwyn Onn, whose chapel, with its altar, shrines, and piscina, stood at the south-east angle, are said to have been the first to respond to the call, and their teams to have carried the first loads of stone. It is most likely that the chancel was thrown out, and the work finished about 1480; but the beautiful tower, the gem of the whole building, and one of the seven enumerated wonders of Wales, was not completed until 1506. Further improvements are said to have been made in the time of Bishop Birkhead, 1513-18, who is stated by Edwards, the editor of Brown Willis, and a former curate of this parish, to have been a great promoter of it. A subsequent bishop, Parfew (or Wharton), resided much of his time here, and endeavoured to procure "a licence for to remove his see or cathedral church" to this place, of which Leland wrote about this same time, that "Wrexham hath a goodlie church collegiate, as one of the fairest of all North Wales, but there longeth no prebends to it." In Queen Elizabeth's reign the church was enlarged by the addition of the south aisle, the roof run along the north side. During the Commonwealth it was desecrated into a prison according to Brown Willis, and into a stable according to others. A peal of ten bells, by Rudhall, of Gloucester, was set up in 1726, their total cost being £450 17s. 8d. In 1779 an organ, by Green, of London, was purchased for £360, and was reckoned the finest at that time in the diocese, with the exception of that in the cathedral. In 1789-90 the pavement was levelled, the pews made more regular, and a new pulpit and desk inserted. In 1820-21 two large galleries were erected, running the whole length of the north and south aisles. In 1853 the organ at the west end was reconstructed, so as to expose the fine west window through the tower, and, finally, in 1867, the whole church was thoroughly and effectively restored from the plans of the late Mr. B. Ferry, F.S.A. On this occasion the north and south galleries were removed, the old pews and floors replaced by open seats of oak, and encaustic tiles in the aisles and chancel, the latter being of rich design, the wall cleaned, the stonework repaired, and a beautiful new pulpit presented by the mayor, Mr. Peter Walker, at a cost of two hundred guineas; a handsome reading desk of carved oak was added by a subsequent mayor, Mr. John Beale. The cost of the restoration was £4,345, which was defrayed by subscriptions, and the church was reopened for Divine worship on the 16th October, 1867. After this summary of the past history, there will naturally follow some account of it as it is, and the first place must still be given to its fine handsome tower, which Churchyard so quaintly describes:—

> "The steeple there in forme is full foure square
> Yet every way, five pinnacles appeere;
> Trim pictures fayre in stone on outside are
> Made all like waxe, as stone were nothing deere.
> The height so great, the breadth so bigge withall,
> No peece thereof is likely long to fall;
> A worke that stands to stayne a number more
> In any age that hath been buylt before."

By these "five pinnackles" must evidently be understood, not the hexagonal turrets which crown the angles (for of these there are only four); but the finials which top the buttresses, whilst the "trim pictures fayre" point to the numerous statues of the kings, bishops, and saints which ornamented its canopied shrines. Above the door of the porch at the west end of the north aisle there is also still standing an image of the Virgin and Child, and inside the porch two memorials of the long past—a monumental effigy of a mailed knight, whose shield is distinguished by a lion rampant, with a legend, "Hic Jacet Keneverike ap Hovel," and a portion of an early mural painting illustrative of the Crucifixion, whilst another has been brought to light over the chancel arch of similar character; but depicting the Last Judgment. The tower, which is 135ft. in height, is of six stories, divided by bands of ornamental panelling, and surmounted by pinnacled battlements and hexagonal turrets. The walls of the nave and aisles are likewise battlemented, and set off with pinnacles. Mr. Wm. Sydney Jones is the author of our illustration.

WILLS' NEW FACTORY, BRISTOL.

This new factory with its frontage of 300ft. has been erected for the great Bristol firm of tobacco manufacturers, from the designs of Mr. Frank Wills, of Bristol. Mr. A. J. Beaven, of Bedminster, was the builder. The St. Pancras Iron Company supplied the staircases. Mr. E. Sheppard executed the carving. The wood-block flooring throughout is Hawksley's.

CORNISH BENCH ENDS.

The accompanying sketches are a few examples of the rich store of interesting emblematical designs which are to be found carved on the ancient bench ends of the Cornish churches. The labour expended on this particular point of church decoration is very remarkable in the West Country, and although time and vandalism have made havoc of much, there are still many specimens remaining which bear witness to the devotion of the workmen of Catholic days. In the churches of Alternon and Laneast, from which most of these designs are taken, will be seen emblems of our Lord's passion, treated with almost endless variety of inventiveness. Here we have an angel bearing the sudarium of St. Veronica, a shield with dice, lance, and instrument for breaking the legs of those crucified, besides such representations as the Cross, the Crown of Thorns, the Pillar of Scourging, the Rope, &c. What these oft-recurring heads were intended for, whether, as some say, for Druids, or Pontius Pilate, or Judas, who can tell? The antiquarian will find further scope for his speculation in conjecturing the meaning attached to the curious stiff sheep, sword dances, and other almost incomprehensible subjects depicted on the bench end of Alternon. N.B.—The two end examples on the top line are from Sandford, near Crediton, Devon. The drawings given are by Mr. Arthur G. Langdon.

THE PADDOCKS, LEOPARDSTOWN PARK.

In reply to the usual request for information made to the author of this design, we have received no particulars.

HOUSE, TOTLAND BAY, ISLE OF WIGHT.

Totland Bay is a rapidly-developing watering-place situated between Yarmouth and Alum Bay, Isle of Wight. The climate is very equable—mild in winter, bracing in summer. There is a good and copious water supply derived from the singular geological formation known as "Headon Hill." The railway communication to London (*viâ* Lymington) is good, and will be improved when the new line to Bournemouth is opened. A new local railway is approaching completion, connecting Totland Bay and Freshwater with Newport, I.W. (the capital and chief market town), and by it rapid access will be obtained to all parts of the island. There is an excellent hotel with well-appointed stable, and the sea-bathing and boating facilities are unusually satisfactory. Several good villas have been built, and one now in course of erection from the design of Mr. Ernest Turner we illustrate in our present number.

ST. PETER PORT CHURCH, GUERNSEY.

ON June 10 we gave a sheet of furniture from the above church, and we supplement it to-day by other sketches of the same work, all of which has been designed by Mr. John Trollope, and made by Mr. Harry Hems. The choir-stall, intended to seat six choirmen, is well designed for such a purpose. The Litany-desk is French in character. The misereres embody incidents in St. Peter's life, with few exceptions, one of which is herewith given, commemorative of Jubilee year. The oak panel next it illustrates the scene in St. Peter's life where he denies Our Lord; and the soldier roughly gripping the Apostle, and the maid with a ewer on her shoulder, form an effective background.

SECOND MANCHESTER RIFLE VOLUNTEERS—THE NEW HEADQUARTERS.

THE drill hall is situate at the rear, and is lighted from the roof. It is approached from Ardwick Green through an archway of 12ft. in width, and also through an ordinary doorway from the side passage. The front portion of the building, which serves as a screen to the drill hall, is as follows: The basement contains store cellars for camp equipments, coals, warming apparatus, &c. On the ground-floor are the men's room, the sergeants' room, the bar, the main entrance, the staff-sergeant's office, the staircase leading to the upper rooms, and the armoury, the latter having no cellar underneath it; the commanding officer's room, adjutant's room, officers' room, committee room, clothing store, lavatory, &c., are on the first-floor; and over them are the large shooting gallery, a band-room, and a store room in connection with it. The staff-sergeant's residential quarters are situate in the upper part of the great tower. The drill hall is paved with wooden blocks, and some of the other floors are formed of concrete on iron joists; the front of the building is faced with Yorkshire parpoints, and has freestone dressings. The style of architecture is Gothic, beginning with Norman, boldly treated as a ground-work, and finishing with castellated parapets; there are open fireplaces in all the rooms, in addition to a system of warming by hot water. Mr. Lawrence Booth, F.R.I.B.A., of Manchester, designed the building and superintended its erection; and Messrs. Robert Neill and Sons, of Manchester, were the contractors for the principal works.

The Manchester City Art Gallery Committee have purchased, for their permanent collection, from the art treasures of the late Royal Jubilee Exhibition at Old Trafford, "Glen Muich, Aberdeenshire," by the late J. W. Oakes, A.R.A.

In the course of the excavations now in progress in the Dean's Field, at the back of the North Wall, Chester, with the object of laying bare the wall for further inspection by the British Archæological Association, a number of other interesting Roman sepulchral and sculptured stones have been discovered.

COMPETITIONS.

West Ham.—The committee for promoting the erection of a hospital at West Ham, E., in reply to an advertisement inviting competition designs, have received twenty-two sets of plans. Mr. Lewis Angell, a member of the committee, was requested to report on the merits of such plans, but declined, and the reference was made to Prof. Roger Smith, surveyor to the Carpenters' Company, who made a report upon the merits of the various plans submitted, and, in the result, the committee, on Friday last, adopted the design with the motto "Hygeia." Upon opening the sealed letter it was found that Messrs. Houston, of 28, Essex-street, Strand, were the authors, and the premium of £50 was awarded accordingly.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—The second ordinary meeting of the current session was held at Queen's College on Tuesday evening last, Mr. W. Doubleday, vice-president, in the chair. The following gentlemen were elected members of the Association:—Messrs. S. Harris, J. Goode, G. Cox, B. Walker, H. Wigley, C. Lea, G. Ward, H. Bewlay, John Ward, A. Harrison, and T. Keys. A paper on "German Romanesque" was read by Mr. A. Reading, and at the close a vote of thanks, proposed by Mr. H. H. McConnal, and supported by Messrs. Newton and Victor Scruton (hon. sec.), was unanimously accorded the author.

Civil and Mechanical Engineers' Society.—The opening meeting for the present session will take place on Wednesday next at the Town Hall, Westminster, when an address will be given at 7 p.m. by the President, Mr. R. E. Middleton, M.I.C.E., M.I.M.E. The following is the syllabus for the ensuing session, when the meetings will be held at the Town Hall, Westminster, on Wednesday evenings:—

December 21.—Paper on "The Roof of the National Agricultural Hall, Kensington." A. T. Walmisley, A.K.C., M.I.C.E.
January 4, 1888.—General Meeting for the Presentation of Accounts.
January 4.—Paper on "Salmon Passes." A. Fairlie Bruce, A.M.I.C.E.
January 18.—Paper on "Steel Sleepers," H. T. Munday, A.M.I.C.E.
February 1.—Paper on "The Use of Ammonia as a Refrigerating Agent." T. B. Lightfoot, M.I.C.E., M.I.M.E.
February 15.—Paper on "Sea Water for Street Watering." S. Harding Terry, A.M.I.C.E., M.I.M.E.
February 29.—Paper on "Our National Defences." William C. Street, A.R.I.B.A.
March 14.—Paper on "The Construction and Use of the Hopper Dredger. A. C. Schonberg, A.M.I.C.E.
March 28.—Paper on "The Development of Machinery in Relation to Hand Labour." Ambrose A. Myall, A.M.I.C.E.
April 11.—Paper on "Theatres and other Public Buildings." Walter Emden.
April 25.—Paper on "Railways for Rural and Undeveloped Districts." James B. Walton, M.I.C.E.
May 9.—General Meeting for the Presentation of Report, Election of Council, &c., &c.
May 23.—Annual Dinner at Holborn Restaurant.

Edinburgh Architectural Association.—The usual fortnightly meeting of the Association was held on Thursday, the 24th inst., in the Architectural Hall, 42, George-street, Mr. Hippolyte J. Blanc, president, in the chair. Mr. David MacGibbon, architect, read a paper entitled "The Architecture of the South of France—Gothic Period." After referring to the characteristics of the Early Romanesque architecture of Provence, it was pointed out how these were superseded in the 14th century by the introduction of Gothic details from the North, which were gradually ingrafted on the native style; while in many cases designs in Northern Gothic were imported wholesale. These changes were illustrated with sketches from most of the towns of Southern France. Attention was then drawn to the important specimens of Mediæval military architecture still preserved in the towns of Carcassonne and Aigues Mortes, the walls and gates of which remained unchanged from the thirteenth century. The peculiar keep towers of the Rivièra, similar in many respects to those of our own country, were explained and illustrated. The lecture concluded with a description of the island and fortified monastery of St. Honorat in the Bay of Cannes, a place of great interest from its containing examples of every period of Provençal Art.

Glasgow Architectural Association.—Thethird of a series of lectures was delivered on Tuesday week by Mr. G. Washington Browne, architect, Edinburgh, his subject being "The Monastic Orders and Buildings in Scotland"—the honorary president, Mr. T. L. Watson, occupying the chair. The importance to the architectural student of a knowledge of the origin and development of the monastic system was not, the lecturer feared, sufficiently recognised. That in studying its architecture, the interest of knowing what causes, social and religious, led to the results everyone admires might be deepened, a brief history was given of the rise and of the various orders, their spread over Europe—and in Scotland specially—the routine life of the monks, and the canonical rules they professed, particularly as these affected either the arrangements or decorations of their religious house. By a comparison of numerous examples of the abbeys and priories of the different orders in Scotland it was shown that considerable latitude was taken in their interpretation of these rules. Thus Melrose, a Cistercian foundation, violates the prohibition against figure sculpture. This and other variations were caused by artistic feelings and practical exigencies, resulting in a character peculiar to Scotch monastic buildings. Numerous illustrative drawings were referred to in the course of the lecture, at the close of which a hearty vote of thanks was awarded to Mr. Browne.

Proposed Yorkshire Association of Sanitary Inspectors.—On Saturday afternoon a general meeting of Sanitary Inspectors was held in the Leeds Town Hall, when it was resolved unanimously to form a Yorkshire Association of Sanitary Inspectors. The objects of the association are—(*a*) The promotion and interchange among its members of knowledge and information bearing upon the various duties of sanitary inspectors. (*b*) The general promotion of the objects of sanitary science in connection therewith. Mr. T. Pridgin Teale, M.A., was unanimously elected president of the association, Mr. John Newhouse chairman of council, and Mr. Joseph Lindley hon. sec. A code of rules was framed and the inaugural meeting arranged. The following Yorkshire towns and places were represented at the meeting:—Altofts, Bradford, Darton, Keighley, Leeds, Otley, Pontefract, Pudsey, Rothwell, Thornhill, Tadcaster, Wharfedale, and York City.

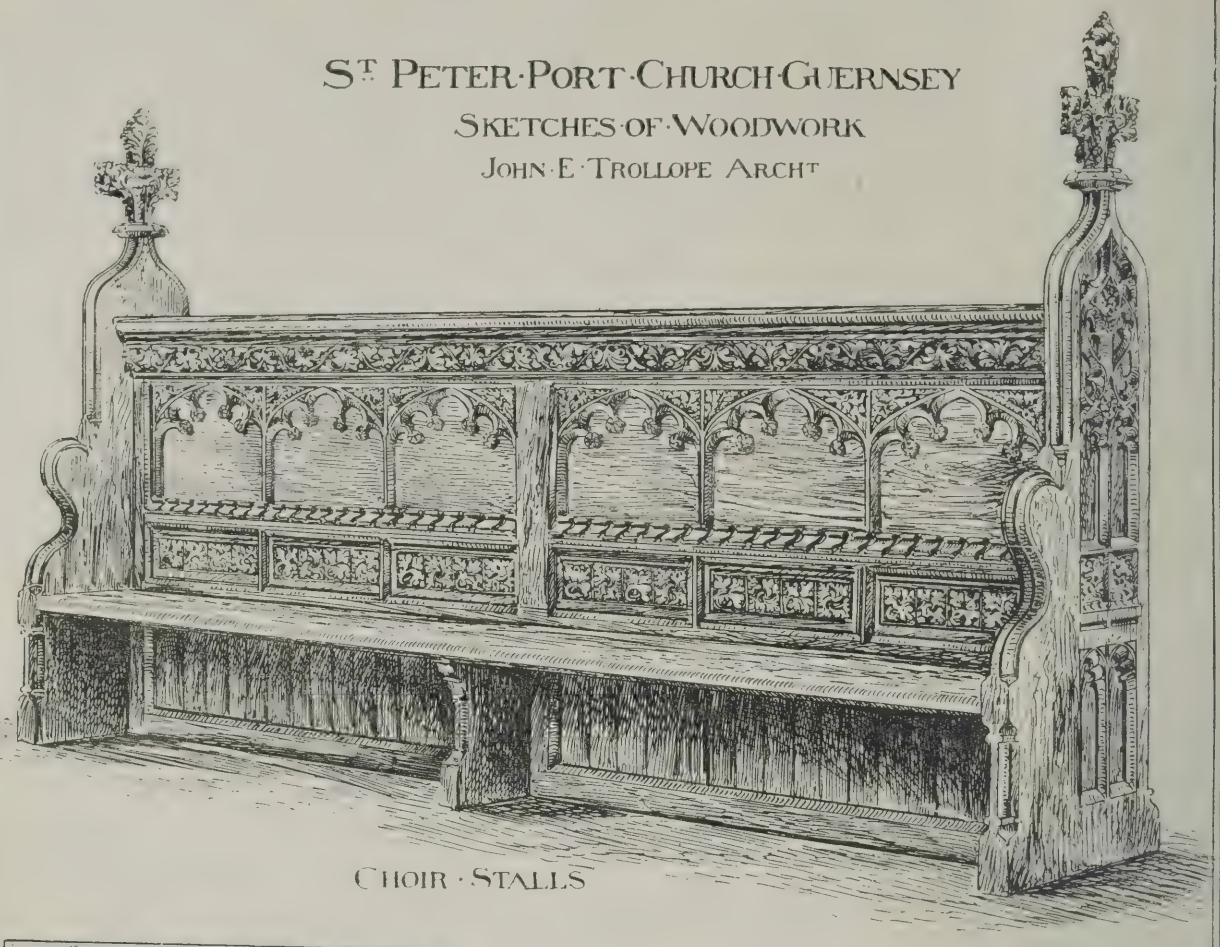
CHIPS.

The recently opened college at Denstone, near Uttoxeter, built from the designs of Messrs. Carpenter and Ingelow, was damaged to the extent of £2,000 by a fire which broke out in the north wing on Saturday.

A memorial altar has just been completed in the Young chantry of St. Mary's R.C. Church, Great Grimsby. The reredos contains five almost life-size figures of saints represented with their traditional emblems, and standing in niches with canopies and pinnacles. The altar was erected by Messrs. Boulton, of Cheltenham, in Bath and Caen stone, with Devonshire marble shafts and panels, from the designs of Messrs. Pugin and Pugin.

In excavating the foundations of the public library at Edinburgh, now in course of erection from Mr. G. Washington Browne's designs, the workmen came upon a carved segment of tracery from a Gothic window, which is believed to be a relic of the town-house of the Monks of Cambuskenneth, which before the Reformation stood on a site a little up the hill.

New Wesleyan Sunday schools are in course of erection at Villa Cross, near Birmingham, from designs by Mr. J. G. Bland, of Temple-street, Birmingham. The public stone-laying took place last week.



Foundation-stones of a new Wesleyan chapel were laid at Little Budworth, Cheshire, last week. The chapel is of red brick, and will seat 150 persons. Mr. Richard Beckett, of Hartford, is the builder.

The Glasgow exhibition of next year will contain ten galleries for the section of fine art, the largest being assigned to the loan collection of British pictures. Other galleries will be devoted to water-colours, photographs, Scottish art, the Continental schools, and English art. The plan adopted at Manchester of separating the galleries by fireproof doors on Chubb's principle will also be availed of, and the electric light used.

WAYSIDE NOTES.

LORD SALISBURY, in a recent speech at Oxford, touched upon a subject which, while of great moment to all, is of especial interest to the architect. Referring to the question of land taxation, and the many other proposals for throwing burdens upon the landowner, he very strongly urged upon his audience the nature of the evil that would assuredly result from the passing of such measures as have been advocated by many short-sighted, if well-intentioned, persons. Said his Lordship:—"If you want to increase the number of small owners in the land you must not bully the landlords. The more you increase the burdens on land, the more you treat it as a kind of parish investment, the more you inflict upon it, as many of our legislators are prepared to do, every kind of exceptional disability and inconvenience, the more do you drive it into the hands of the rich men. Land, in proportion as land is an advantageous investment favoured by the State, or not injured by the State, will find its way according to economical laws into the hands of small owners; but directly you affix to it any disability, directly you attach to it any laws or disability peculiar to it, then it becomes a thing in which only those can indulge who have surplus money to throw away, and, therefore, in that direction you diminish the chance of what we all profess to desire, the increase of the occupiers who are the owners of their own land . . . and if you wish—as I hope you wish, and I most earnestly wish—to multiply the owners of land, you must resist to the utmost any proposition to treat land in any more unfavourable manner than any other investment."

It is to be presumed that most architects will be of opinion that it would not be to the advantage of the profession to have land become "a thing in which only those can indulge who have surplus money to throw away." A gentleman member of the building trade, whom I believe I have before mentioned, would, however, be glad enough, as houses must be built, and if fewer are erected by private persons, the more must be built by him and his *co-frères*. Lord Salisbury's arguments refer, directly, to the farming interests and agriculture; but they apply with equal force to the relations between the building public and building-land, as it would be affected by that taxation of ground-rents which is threatened in certain quarters. The policy of every architect with regard to the land question should be towards simplification of transfer, the keeping of land free from all obligations that would discourage its purchase, and towards all such measures as would encourage the public to invest freely in real estate.

Affairs in Ireland remain about as cheerful as ever. How far the unsettled, turbulent state of the country affects the building trade I neither know nor pretend to; but it would seem to me that with the wholesale want of confidence that must be felt on the other side of St. George's Channel, there can be but a poor spirit amongst those who find the wherewithal to build. The land question, and all the gush about confiscation and other theories of revolutionary agitators, are harmful enough here, and drive capital into every other source but that which would benefit the architect; but in Ireland there is the question of Home Rule ever hanging, like the sword of Damocles, above the heads of the Loyalists, and it cannot but inevitably quench many of the contemplated speculations of the capitalist. Besides, by reason of the destruction of trade, by the ruin of the country gentleman, and by the slackness of business in general, there can be but little call for mansion-house-building from our friend the Hibernian architect.

It is curious to reflect upon the proceedings of many of the besieged "no-renters" in Irish provinces. If the war between the tenant and the bailiff is to continue a feature in the land, we may see the Irish homestead develop into a peculiar sort of fortress and stronghold! How useful would a besieged Land Leaguer find the machicolated principle of wall-building! He might then pour down hot tar, boiling metal, or what-not, in the most comfortable manner conceivable. Or perhaps he might revert to the old custom of constructing "murthering holes," which, as I believe, were breaches, constructed for purposes of offence, in the vaulting of the inner porches of old Irish towers.

The *battering-ram* is to become quite a fashionable implement at evictions! Last Monday evening a force of police arrived at New Ross to assist the Sheriff in taking possession of the second holding of one David Foley, of Ballykerogue. This gentleman was evicted from his first holding at the end of October. Upon this occasion, we read, the Sheriff hoped "to be able to keep his men out of danger from boiling water by using a battering-ram—a pole 25ft. long, tipped with iron, and suspended by a chain from a triangle. The men working it will be able at a safe distance to swing the ram against doors and windows and effect a breach with comparative ease." Well, history certainly does repeat itself!

On the Wednesday following we learned what happened. After preliminaries, "the emergency-men began vigorously to work the *battering-ram*, which in about five minutes had brought down nearly the whole end of the house." The besieged replied with hot water and *stones*. But "the Sheriff's men were protected by *wicker shields* covered with canvas." Excepting for the employment of a fire-engine, this little episode quite reads like a piece of old history.

The last paper read at the Institute appears to have been an interesting one. We most of us only wish we could get our clients to indulge in porphyry to some extent. £5 per centum upon a material costing £8 per foot cube would be paying work, not to mention the "com." on the labour. Porphyry is an exceedingly beautiful substance, and, as Mr. Waterhouse said, a gem amongst building materials. The student will, doubtless, find specimens of it at the Jermyn-street museum, besides the practical applications referred to by the lecturer at Conduit-street. In the recently-erected monument to M. A. Thiers, at Paris, there is a tablet of green porphyry bearing in gold letters the legend "*Patriam dilexit veritatem coluit.*" Let us hope that Mr. Brindley will be successful in selling porphyry at £3 per foot cube, though even that is no small price to pay for a building material.

Best and hearty wishes for the success of the A. A. Cyling Club and the sketching scheme. But, to be candid, I must confess to feeling a sort of regret at the idea of all our old national architecture being thus sketched and measured. To think that every dear little, out-of-the-way nook and cranny, every ivy-covered church and ruined chapel, and every thing of archæological interest, "from the pre-historic boat discovered at Brigg, down even to post-Reformation work," should be tabulated by the London A.A., and that we should have chapter and verse for every moulding, cap, or boss in the kingdom, goes decidedly against the grain in this secluded corner of the globe. And, if I mistake not, there are very many more who, like myself, find joy unspeakable when they think they have discovered some piece of old architecture—some hidden-away remnant of the past which they believe has not been measured to a joint, or otherwise hackneyed. How much of the pleasure of travelling through our country towns and villages would be destroyed were every old building therein as familiar to us from illustrations as the houses and shops in the Strand or Cheapside.

Touching the cycling part of the scheme, I trust that it will be a great success, since nothing is more enjoyable than running about the country on the "wheel" in search of old architecture, as I can testify from experience. And under Mr. Appleton's energetic captainship it will doubtless be successful. I would suggest that the club affiliate with the C.T.C., who now number some 20,000 members.

What next? A builder advertises a competition amongst "architects and others." A "£25 prize will be given for the best plan, elevation, &c., for erection of hotel and boarding-house in Broadway, Douglas, Isle of Man." Full particulars, it is said, will be supplied by a builder of Douglas. Mark the to "architects *and others*." It is to be expected that the "others" will win the day, as it is unlikely that any genuine architect will answer such an advertisement.

"If," said the *Echo* at the beginning of the week, "Alderman Saunders, who was elected for Coleman-street Ward on Saturday, succeeds to the Mayoralty, he will be the first architect that has filled the office of Lord Mayor of London."

I note that there will be shortly completed a building in England in the French Flamboyant style. As things go it will be rather a novelty. Many English architects borrow hints as to detail from the Flamboyant architecture of France, and, with commendable zeal, endeavour to fit it into our own Perpendicular style. But few boldly produce a purely Flamboyant design. Not that the building referred to—the Mausoleum at Farnborough, erected by the Empress Eugenie for the reception of the remains of Napoleon III. and the Prince Imperial—has been designed by an Englishman. The architect is reported to be M. Destelleiur, President of the Society of Architects of Paris, who appears to have adopted a rather fashionable plan in his work—viz., the provision of a crypt in the 12th-century style.

Your correspondent's, Mr. E. L. Garbett, suggestion as to the likeness between celery and Early Gothic foliage, reminds me that a certain variety of *endive* bears a most striking resemblance to Flamboyant carving. I remember last August being served in the *salle-à-manger* of a certain quaint old Norman hotel with some of this vegetable, which ridiculously resembled, in line and form, much of the carving in the cathedral hard by. At the time I had the pleasure of meeting, and sojourning with, an English architect, and I remember how we joked about our devouring the prototype of Flamboyant foliage. So, if the carving of this period of French architecture resemble the endive plant, there may be likewise a resemblance between celery and our Old English work. Personally, I have never noticed the latter likeness; but, possibly, this is through want of observation, so I intend to make a critical examination of the celery plant; while, for the present, I hold to my original theory.

I am glad you and the Institute and Mr Lawrence Harvey are moving in the matter of the prizes for masonry. I am sure this is a step in the right direction—not so much as regards the particular subject Mr. Harvey teaches, but because it is the first real attempt at *bonâ fide* "technical instruction" as far as architecture is concerned. More power and much perseverance to Mr. Harvey! May scores more imitate him, and may classes for artisans in all branches of the trades be formed for the benefit not only of architects but of artisans.

GOTH.

Mr. James Ebenezer Saunders, J.P., F.S.A, F.R.I.B.A., of 9, Finsbury-circus, was elected an Alderman of the City of London on Saturday. Mr. Saunders, who is 55 years of age, has, it was mentioned by the seconder of the proposal, represented the ward in the Court of Common Council since 1856 and had been deputy alderman since 1875; he has served during the last 30 years on nearly all the committees of the Corporation, and has been chairman of many of them, and he has also represented the City of London on the Metropolitan Board of Works for a great many years. He is in politics a Liberal, and he unsuccessfully contested the Dartford Division of Kent against Sir W. Hart Dyke at the last two elections. For many years he was a member of the London School Board. He is a Congregationalist. In the ordinary course of succession by rota, Alderman Saunders will probably be Lord Mayor in 1895-6.

The ceremony of turning on the new water supply to the burghs of East and West Anstruther was performed last week. The scheme consists of the old works used by Pittenweem, extended and improved to a great extent. The new reservoir holds 3,000,000 gallons, while the two filters are 39ft. long, 42ft. broad, and 8ft. deep, and are capable of passing 150,000 gallons per day. The clear-water well is 30ft. diameter and 9ft. deep. The engineer of the works was Mr. Buchanan, C.E., Edinburgh, and the contractors were Messrs. Mackay and Son, Broughty Ferry. The total cost was £4,500.

* Mr. Buggins.

PUBLIC WORKS EXAMINATIONS.

TABLE showing result of an open competitive examination held on the 11th and following days of October, in year 1887, of candidates for one situation as Assistant Surveyor of Buildings, Public Works Office, Ireland :—

		Arithmetic.	Orthography.	Handwriting.	English Composition.	Geometrical Drawing.	Freehand sketching in outline.	Knowledge of Materials.	Designing simple buildings, &c	Taking out quantities from plans, &c.	Surveying, levelling, and valuing lands.	Totals.

NOTES ON THE PSYCHOLOGICAL BASIS OF FINE ART.*

THOUGH a work of fine art is appreciated by nearly every person in whom the perceptive faculties are developed, very few persons care to inquire how, or in what manner, the sense of pleasure in contemplating it is awakened. These are inquiries left for theorists and philosophers, like Lessing, Alison, Dugald Stewart, and Mr. Herbert Spencer. It is well and proper that the artist should know something of the conditions upon which the pleasure derived from works of art depends. Mr. Frank Stephen Granger, M.A., the author of a work under the above title, has done service in throwing his philosophical reading and reflection into shape in these "Notes." They are, as he says, rather fragmentary, and have been put together at intervals ; but they fairly sum up the abstract principles which underlie the fine arts. Mr. Granger is clearly a deep reader and student of Mr. Herbert Spencer, whose principles of psychology and essays on the fine arts can very largely be traced. Chapter I. deals with the nature of the pleasure received from works of art. We have here, in distinct sections, an attempt to enunciate the kind of feelings which are called æsthetic, and their bearing upon art. Lessing's definition that "pleasure is the end to which fine arts are directed, and that the law of beauty is the law of all noble art" is accepted. We cannot here refer to any of the propositions laid down, though the author seems to have satisfactorily deduced them from the primal conditions. It will be generally allowed that works of art very much depend for their pleasure-giving effect on the associations aroused by them. It is true, as Mr. Granger says, that as Scott's novels supplied the memories with which the Gothic revival in architecture was associated, the works of Thackeray and Dickens paved the way for the Queen Anne revival. So it is indisputable that there is a connection between beauty with pleasant associations and feelings and between ugliness with the opposite class of impressions.

In Chapter II. the author enters into the results of the inquiry. He defines the terms used in relation to art, such as "idealism," "realism," "caricature," and gives numerous examples from literature, painting, and sculpture. Thus the value of the unseen or *indefinite* in works of the imagination is dwelt on. Practically, there must be a certain want of finish in the picture to raise it to this frame of mind. Too great accuracy in painting hampers the imagination by leaving the infinite out of the question. In this distinction lies the immeasurable superiority of the painting over the photograph : the latter is an accurate impression of but one instant of time, it does not give the idea of shifting lights and shadows. The painter, on the other hand, merely seeks to suggest, leaving the imagination to fill up ideas and voids ; so also the poet selects words which conjure up ideas and sentiments of the soul. A scientific terminology is out of place.

In the last chapter Mr. Granger applies the principles enunciated to the fine arts. Foremost he places religious worship and the æsthetic emotions they awaken. He instances the deep emotions aroused at the sacrifice of the Mass, when accompanied by gorgeous vestments, fine architecture, and the strains of music. But these accessorial arts should be used for what they suggest, not for what they are. As the author says, it was the inability of Rome to pierce through its symbols that caused the Protestant revolt. Yet there are some who will always need the symbol to grasp religious truths.

There is little application made to architecture, which stands in the same relation to painting and sculpture as music does to poetry. This last chapter is worth reading, and the author has at least succeeded in bringing into something like a comprehensible connection the relations of the arts. We should have liked to have seen architecture treated more fully than it is ; but of course this would have been impossible in a work dealing only with principles and abstract ideas. Mr. Granger's little book ought, however, to be read.

* Notes on the Psychological Basis of Fine Art. By FRANK STEPHEN GRANGER, M.A., &c. Nottingham : James Bell

THE LATE MR. EDMUND WOODTHORPE.

BY the sudden death, early on Saturday morning, of Mr. Edmund Woodthorpe, F.R.I.B.A., of Coleman-street-buildings, E.C., the district surveyors of London have lost their senior member, and a widely known and much respected architect and surveyor, enjoying an extensive City practice, has passed away. Mr. Woodthorpe had been in his usual health, and was at his office throughout the week until Friday afternoon, when, with Mrs. Woodthorpe, he visited some friends at Hornsey. During the night he was seized with illness, and died at half-past 1 a.m. from heart disease, within a few days of completing his 75th year.

Mr. Woodthorpe bore a name long honoured in the City, insomuch as his grandfather, father, and brother held, in direct succession, the office of Town Clerk of London. He was the son of the late Mr. Henry Woodthorpe, LL.D., and a pupil of the late Philip Hardwick, R.A., whom he assisted in the erection of Goldsmiths' Hall. After the termination of his articles, Mr. Woodthorpe commenced practice in the City, his chief work consisting of mercantile premises and warehouses, and in later years, the planning of industrial and artisans' dwellings. He also erected many schools, rectories, and country residences, and carried out several church restorations, including those of St. Giles, Cripplegate, St. Mary, Aldermanbury, and St. Swithin, Cannon-street, and designed the new English Presbyterian Church at Hammersmith. Where not restricted, as in workmen's dwellings, to the minimum of cost for the required accommodation, or in works of restoration, his work was generally based on some phase of the Renaissance, the Italian development of that style having the preference. Among Mr. Woodthorpe's works may be mentioned the following :—The market, museum, and mansions, Wellesley-terrace, Dover ; Messrs. Courtauld's crape warehouse, Aldermanbury ; Messrs. Rendell's tea warehouse, Eastcheap ; Messrs. Borwick's warehouses, Bunhill-row ; the Lodge, Kegworth, Leicestershire ; additions to the mansion of Stoke Pogis, Berks ; the Knoll, Kingston, Surrey ; the completion of, and decorations to, mansion, Angley Park, Cranbrook ; new drawing-room, kitchen, clerk's offices, and quadrangle at the Girdlers' Hall, Basinghall-street ; Cornhill Chambers ; Messrs. Webster Bros.'s premises, Lombard-street ; new bullion vaults and fittings, Bank of London ; Messrs. Harmer and Pearson's distillery, Red Cross-street, E.C. ; workhouse for the Hartley Whitney Union, Hants ; Beeston's and also Palyn's almshouses, Peckham ; Sir William Staines' almshouses, Tottenham ; schools at Lambeth (St. Andrew's national), Witley, Red Hill, Binstead, Odiham (endowed grammar), Hants ; Red Cross-street, E.C., Lady Holle's (endowed), and Mare-street, Hackney (middle class girls). He laid out and developed large estates at Hammersmith, Richmond, Brook Green, and Stoke Newington, and was largely engaged in valuations of City property during the formation of the Metropolitan Railway system. The following, among other important works, have been carried out in conjunction with Mr. Frederic Hammond, A.R.I.B.A., his

partner and former pupil — viz., Bleyton's industrial dwellings (£50,000), Nile-street, Hoxton, opened by the Prince and Princess of Wales in 1886; large blocks of industrial dwellings, East-street, Walworth (£65,000); the St. John's gymnasium, Upper Holloway; the St. John's Institute, Holloway; St. John's Mission Church, Highgate; very extensive works in erecting magazines, mills, engine house, corning houses, and other buildings for the Chilworth Gunpowder Company, Limited, Surrey; warehouses, Fore-street, City, for Mr. W. Brass; the restoration of the south side of St. Giles's Church, Cripplegate; and the erection of the Jubilee Memorial drinking fountain in Criplegate churchyard.

In 1839 he joined the Royal Institute as an Associate, and in the same year was appointed by the Middlesex magistrates district surveyor for St. Anne, Limehouse; St. John, Wapping; the precinct of St. Katherine; and the Hamlet of Ratcliff; and in 1853 he also received from the Court of Aldermen the appointment of the Northern Division of the City of London, both of which posts he retained until his death. He recently served as President of the Association of District Surveyors. He was also architect to the Girdlers' Company and surveyor to the parish and joint trustees of Cripplegate. He became a Fellow of the Institute in 1846, and some years since served on the Council. Mr. Woodthorpe was one of the most constant attendants at the Institute meetings, and indeed, was present at the meeting of Monday in last week; he was a reformer and a supporter of the examination movement, and his tersely expressed and vigorous ejaculations from the corner seat of the front bench to the President's right hand, often enlivened the dull decorum of an evening at Conduit-street. He was also a Fellow of the Surveyors' Institute, having been elected in March, 1875, and an active member of the London and Middlesex Archæological Society, to which latter body he occasionally contributed papers. He lived at Grayshott, near Liphook, Hants, and leaves a widow, one son (Mr. Edmund Woodthorpe, M.A., A.R.I.B.A.), and a daughter. The funeral took place in the village churchyard of Headley, Hants, on Wednesday, when many members of the profession were present.

CHIPS.

Drapers' Gardens, London Wall, E.C., is about to be thrown open to the public.

The town council of Edinburgh have selected as the site for the statue to Dr. William Chambers the centre of Chambers-street, opposite the entrance to the Industrial Museum.

The Wolverhampton council have raised the salary of their borough surveyor, Mr. R. E. W. Berrington, from £220 to £300 a year.

Workmen are being employed this week in removing the stones of Temple Bar from the open space in Farringdon-street, where they have lain since the demolition of the ancient gateway. The stones are being taken to Theobald's Park, Cheshunt, the residence of Sir Henry Meux, who will re-erect the gateway at his own cost, the materials, which weigh some 400 tons, having been given him by the City Corporation.

Mr. W. St. Chad Boscawen will deliver, at the British Museum, a special series of lectures on the history and civilisation of Babylonia, on Wednesday afternoons, at half-past two. The subject of the present course of four lectures will be "The History and Civilisation of the Early Babylonian Empire," dealing with the period from B.C. 4000 until the consolidation of the Empire in B.C. 2200. The lectures will be specially illustrated by the discoveries made by M. de Sarze in Chaldea and Mr. Rassam at Sippara.

St. Mary's parish church, Nonington, Kent, was reopened yesterday (Thursday), after restoration from plans by Mr. Ewan Christian, at a cost of £2,000. A new roof of deal has been placed over the nave, the north aisle roof has been repaired, a south porch of flint, stone, and oak erected, and the west door opened out. The windows have been restored, and the nave and north aisle reseated in oak, while the base of the tower has been fitted up as a vestry.

Lieut.-Gen. Alexander, late Bengal Staff Corps, and for many years superintending engineer in the Department of Public Works at Hyderabad, and secretary to the Resident in the same Department, died on Friday, aged 64 years.

Building Intelligence.

LEEDS.—The building inspector of the Leeds Corporation (Mr. D. Hainsworth) has made a report of the work done by his department during the year ending August 31st last. The number of plans of houses approved was 323, upon which were shown 1,847 houses, including 18 villas, 16 semi-detached villas, 693 through houses, and 1,120 back-to-back houses. Plans were also passed for one church, two chapels, four mission-rooms, six schools, one arcade, the Museum and Fine Art Gallery, and additions to one chapel and four schools. The total number of buildings approved was 4,289, and plans for 573 were rejected. During the year 1,208 houses were completed, and certified for occupation, including ten villas, two semi-detached villas, 413 through houses, and 783 back-to-back houses, while 672 miscellaneous buildings and 621 ashpits, &c., were completed and certified.

PENTNEY, NORFOLK.—On the 17th ult. the Bishop of Norwich reopened this church, which has been closed for restoration. The works consist of taking up the old flooring and relaying a solid deal wood block floor by Mr. Roger Lowe, of Farnworth, near Bolton; setting back the chancel to its original line and raising it one step above the nave floor; reseating with pitch pine the whole of the nave and chancel, and putting a screen across the west end to form a vestry in the same position as the old deal one. The organ, formerly at the west end, has been placed in the chancel on the north side. The pulpit, reading-desk, and lectern are in oak, and with the entire fittings of the church, have been designed in the characteristic Perpendicular style prevalent in this part of Norfolk. The fabric of the church has not been touched in any way beyond making it watertight. The carving to the pulpit was done by Mr. J. E. Knox, of Doris-street, Lambeth. The works have been executed by Mr. W. H. Brown, the builder, of King's Lynn, from the designs and under the superintendence of Mr. E. Guy Dawber, architect, of 36, South-street, Park-lane, W.

Engineering Notes.

ABERDEEN.—THE CHEMICAL ACTION OF SEAWATER ON CONCRETE.—A meeting of the special committee appointed by the Aberdeen Harbour Board to consider the question of the condition of the graving dock was held on Saturday. Mr. Messent, engineer to the Tyne Commissioners, who was requested to make a special survey of the work, presented a long report in draft form, which bears out the conclusions of Dr. Brazier, Professor of Chemistry in Aberdeen University, and Mr. Smith, the harbour engineer, regarding the chemical action of the seawater on the concrete used in the construction of the dock. It was discovered by the harbour engineer some time ago that the Portland cement concrete walls had expanded 2¾in. on the height of the walls, their surfaces had cracked and bulged, and the joints of the caisson quoin stones had opened up, causing considerable leakage. Discussion on the expert's report was deferred for a few days.

HYDRAULIC PASSENGER LIFTS.—A lecture was delivered on Friday night before the Midland Scientific Society, Birmingham, by Mr. G. C. Marks, C.E., on "Hydraulic Lifts for Passenger Service." The lecturer reviewed the various systems of "elevating" passengers, by describing in detail the rack and pinion, the multiple chain, the direct-acting ram, the hydraulic-balanced ram, and the suspended or standard type of the American Elevator Company. The many dangers and pitfalls that intending hoist-owners make for themselves by considering the cheapness of the machine, rather than its safety, efficiency, and economy of maintenance, were pointed out, and it was mentioned that out of eleven recently reported hoist accidents, only two were unprovided with so-called safety catches. The use of cheap single-chain hoists was condemned, the users of such were cautioned against the evil day sooner or later to meet them. The American standard elevator or Otis hoists in the city of New York alone, numbering, goods and passengers together, some sixteen hundred, carry daily over 400,000 passengers and 10,000 tons of merchandise, or far more than the underground railways of London. It was mentioned that speeds varying from 350 to 500ft. per minute were quite common in America, while the recent lifts erected at the Mersey Tunnel were considered quite fast enough at 120ft. per minute. The system of safety catches employed in this description of hoist was described, and the possibility of all four ropes breaking shown to be a contingency, though utterly impossible, yet of no cause for alarm, seeing that the wedges would instantly prevent the cage falling.

CHIPS.

The committee for the erection of the East Memorial window in St. Andrew's Church, Newcastle-on-Tyne, adopted on Friday a design and estimate by Mr. W. H. Atkinson, of that city.

Dancill church, near Uckfield, Sussex, caught fire from the over-heating of a stove on Monday week, the result being that the nave was gutted, its roof destroyed, and the tower greatly injured.

The committee for the erection of a technical school at Dewsbury having received £5,000, have purchased a site near the vicarage grounds, now the district infirmary, for £1,000, and have decided to institute a competition for plans for the building, which will cover 5,400sq.ft. of ground, to be limited to architects practising within the limits of the municipal borough.

Mr. Selwyn Image will deliver four lectures on "Art," at Willis's Rooms, the first on Saturday in next week, the 10th inst., being on "Literature in Connection with the Pictorial and Plastic Arts" and on "Literary Art Criticism."

At the Central Criminal Court on Monday, Henry George Muggeridge, 50, described as a builder, was sentenced to 15 months' hard labour for forging and uttering receipts for the sums of £5 12s. 10d. and £3 1s. with intent to defraud. The prisoner had made the acquaintance of persons in financial difficulties, and had offered to arrange with their creditors. In two cases he represented that upon paying 4s. in the pound the creditors would release the debtors; but in each case the prisoner forged the receipts of the creditors and himself appropriated the money.

The annual dinner of the Institute of Painters in Oil took place last evening, Sir James Linton, the president, in the chair. After the usual loyal toasts, Mr. Hamilton Macallum proposed the toast of "The Institute," to which Sir James Linton responded. The president proposed "The Honorary Officers," to which Mr. Greville Chester replied. Mr. Orrock then gave the toast of "The Guests," which was responded to by Sir Edward Sieveking, Mr. Frederick Wedmore, Mr. John Pettie, R.A., and Mr. William Agnew.

The mausoleum at Farnborough, erected by the Empress Eugenie for the reception of the remains of Napoleon III. and the Prince Imperial, will be completed in a few weeks, and the re-interment, which it is expected will be attended by some members of the Royal Family, will then take place. The church, which is close to the Empress's residence at Farnborough, is built in the Famboyant style of French architecture, while the crypt is of the 12th-century style. The floor of the crypt is laid in solid marble, and the two sarcophagi are of red granite, supplied by Messrs. Fraser and Co., Aberdeen. That for the reception of the late Emperor's remains was presented by the Queen. The tombs are placed on either side of the crypt, and there is a white stone altar at the head of the sepulchre. Adjoining the church is the Priory, which has just been completed. The architect was M. Destelleiur, President of the Society of Architects of Paris.

At the meeting of Convocation of Oxford University on Tuesday, grants of £730 were made for extension of accommodation at the Bodleian Library; £250 for transfer of the Arundel Marbles to the University Galleries, where they will be under the care of the Professor of Classical Archæology; and £500 for building a lodge for the caretaker of the Clarendon Laboratory. A proposal to grant £1,200 for continuing the arrangement and cataloguing of the Pitt-Rivers collection was recommended by the President of Corpus, on the ground that the catalogue would be of the highest educational value, and that without it the collection would be useless, and the University would have expended £9,000 on the gift to no purpose. The vote was carried by 47 to 10.

A receiving order in bankruptcy has been granted in the case of Philip Harrison Dawes, of Great George-street, Westminster, and King's Lynn, builder and contractor.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., and XII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—S. and Co.—T. H. B.—B. and P.—F. and B.—St. P. I. Co.—J. L.—F. M. and Co.—D. E. S.—J. S.—H. T. and Co.—C. S. and Co.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED FOR SUBJECTS A AND B.

"HERMANI," "Dutch Clinker," "Sapphire," "Huz," "Lancashire Lad," "Exonia," "Compta," "Leodiensis," "A Student," "Pupil," "Gilbert," "Design," "Aidan," "W. H. L." in circle," "Frost," "Mancunium," "Use," "Mumps," "Power," "Samivel," "Rusticus," "Celt," "Lawton," "Janitor," "Henery," "Arry," "Veritas," "Veritas Vincit."

F. M. R. (Yes, the name and address of the author must be written on the back of each drawing.)—SIDNEY BARRY. (The sections and elevations should be drawn one way on the sheet. If the space is too limited, make the perspective sketch smaller.)—GEORGE GODWIN. (Read the rules and follow them. The scale in each case should be drawn on the sheet.)

SECOND LIST OF SUBJECTS.

C.—A village smithy, with a coachhouse for four carriages or carts by the side, a little office, and a small store for nails and other smith's stock in trade; all contrived under one roof, with a grindle-stone under pent roof at one end. The smithery to have two forges, and running at right angles with it a wheelwright's shop, 20ft. wide by 30ft. long, is to be placed, having a frontage along the return road, the building standing on an angle site. Style suitable for stone and timber. Scale, 8ft. to the inch. View, elevation, section, and plans.

D.—A china cabinet in walnut, 4ft. wide and 6ft. high, with glazed fronted cupboards suitable for the display of art objects, and fitted with shelves. Style, Old English, end of 18th century. Elevation, section, plans, and sketch, inch scale.

TO PRACTICAL MASONS.—The President and several members of the council of the Royal Institute of British Architects and the proprietors of the BUILDING NEWS offer prizes of Ten Guineas, Five Guineas, and Certificates for the best models of vaulting at the angle of a cloister. For lessons, inquire Class of Masonry, Guilds Institute, South Kensington, Monday evening, between 8 and 9 o'clock.

Correspondence.

ARCHITECTS' AND ENGINEERS' REGISTRATION ACT.

To the Editor of the BUILDING NEWS.

SIR,—The negotiations that have been carried on for some time past with reference to the presentation of the above Bill to the House of Commons have been now concluded by the Architects' and Engineers' Registration Act Committee.

I shall be obliged, therefore, if you will allow me to make it known through your columns that the Bill will be presented early next session by Colonel Duncan, R.A., C.B., M.P., who met a deputation of the committee at St. James's Hall last week, and has kindly undertaken the care of the Bill, supported by leading members of the House.

It is hoped that a ready response will be given to the appeal now being made for subscriptions to carry out the object in view, and I would call the attention of all interested in this movement to the advertisement on the subject appearing in another part of this Journal.—I am, &c.,

EDGAR FARMAN, Hon. Sec.

39, King-street, Cheapside, E.C., Nov. 30.

SIR,—It is a pleasure to many of your readers to notice that the Registration Bill Committee has come to life again, and intends to carry the work, which it has so well commenced, to its logical conclusion at an early opportunity. The appeal which has been made for volunteers to act as local hon. secs. should be well responded to, for none know so well as provincial men how necessary to the future of architecture the Bill has become. A little vigour shown just at this crisis will be of immense service to the profession.

Many will have been amused by the way in which the matter has been treated in the *Journal of Proceedings* of the R.I.B.A., and by the presidents of various provincial societies who are led by the nose by that august body. Having woke up at last to the importance and necessity of compulsory registration, they enter upon a long and tedious discussion as to the method of bringing it about, the majority being in favour of obtaining Parliamentary powers (some few going so far as to declare that without them registration would be a dead letter; but by no means all), and a small minority stating that the Institute already possesses sufficient power to accomplish the object in view. All the time the Registration Bill is in existence, and its provisions are known to all—provisions which secure Registration by the best and the only possible way.—I am, &c. A.R.I.B.A.

SIR, —A remark in a letter by the late Mr. Viollet-le-Duc, which I happened to meet with to-day, and which related to the question of a government diploma for architects, struck me that one point in connection with the proposed Registration Bill has not been canvassed.

Will the Registration Bill compel the public to employ none but qualified practitioners? If it does, the public will undoubtedly have a good case against the Government in the event of any mistake or any want of capacity on the part of the architect in any branch of his profession.

While in favour of the Bill, I should like to know to what extent the architect's responsibility will be increased.—I am, &c.,

EDWARD W. JENNINGS.

Swansea, Nov. 29.

[What case has the public against the Government in the cases of incompetent or dishonest lawyers or physicians?—ED. "B. N."]

"DRAUGHTSMEN'S PROVIDENT FUND."

SIR,—Permit me to suggest through your columns that all draughtsmen in the architectural, surveying, and engineering professions who have read or heard of this movement, should make a point of speaking of it to their friends and acquaintances in any of the above-referred-to professions, in case it has not been noticed or heard of by them, and let their friends in their turn spread the news to others; also that all should make a point of consulting the columns of the BUILDING NEWS carefully every week for any notices, &c., that may appear from time to time, or for the notice of the next public meeting that will be held, when the rules, &c., are completed. Furthermore, let all who are in favour of the movement write to the hon. secretary, Mr. G. A. T. Middleton, St. James's Hall, Piccadilly, intimating the same. By the above suggestion assistants will help greatly to lighten the labours of the committee. Will assistants kindly note this? If they wish to become known to the committee, they must communicate with them, as there are no known means of finding them out—their names do not find any place in directories. In conclusion, I trust that every draughtsman engaged in any of the above professions, without exception, and without regard to the state of the atmosphere or condition of the weather, will attend the next public meeting. I inclose my card, and beg to subscribe myself a believer in "a long pull, a strong pull, and a pull altogether."—I am, &c., R. W. C. D.

SIR,—As you remarked in your "Office Table" notes last week, there have been several efforts to start a Draughtsmen's Provident Fund of recent years; but, like most things taken up by either architects or their assistants until recently, they have been entered upon in only a half-hearted spirit, and have borne within them the seeds of failure, from being confined to architectural draughtsmen only. This mistake is not likely to be repeated, and all who heard Mr. Chambers at St. James' Hall must have been satisfied that a leader has appeared at last with energy and ability to carry the matter to a successful conclusion. There was one slight error in your report of his opening speech, however, which I trust you will allow me to correct. The letter which he read from the secretary to the Architects' Benevolent Society merely stated his inability to be present at the meeting, and gave no opinion about the Society, whether favourable or otherwise.—I am, &c.,

ONE WHO WAS PRESENT.

SCARBOROUGH CONSTITUTIONAL CLUB COMPETITION.

SIR,—My attention has been called to a letter in your last issue signed "A Lover of Fair Play and Competitor," which, in justice to Mr. Cheers, requires a brief reply.

Although certain modifications have been made in the original plan, yet the author's main conception remains unaltered.

After the premiums had been awarded, the directors were pressed to provide a reading-room on the first floor front. To effect this the architect was compelled to omit three of the offices shown in his first design, while to gain access to the room it became necessary to reverse the position of the principal staircase, and of several rooms from the north of the building to the south; other minor alterations were also unavoidable.

With regard to cost, the directors have considerably amplified and elaborated the original plan. Notwithstanding your correspondent's assertion, the area of the buildings has been extended and the height raised from 2ft. to 5ft. throughout. A handsome oriel window has been introduced, whilst a large proportion of the increased cost is owing to certain items of furniture having been included in the tenders. —I am, &c., S. W. FISHER, Hon. Sec.

Scarborough Constitutional Club Company, Limited, Scarborough, Nov. 28.

SIR,—As the letter *re* the above in your last issue is most unfair and misleading, I must beg in self-vindication to correct the assertions therein contained, merely premising that when one architect attacks another in print, he should give his name, and not hide his identity behind such a worn-out *nom de plume* as a "Lover of Fair Play."

The competition and working drawings for the Club are nearly identical save in size of rooms, though the plan has been reversed from north to south, the principal rooms facing the latter point as an afterthought simply for the sake of quiet and retirement from the noise of the printing-offices on the north side, and not from any fancied improved approach, as your correspondent imagines. Again, more ground *is* covered than originally shown, despite his assertion to the contrary. The assembly-room, a large and lofty apartment, is now 60ft. by 30ft. in place of 52ft. by 30ft. as formerly—a substantial difference in cubing a building. The entire front has been raised 5ft., and the ground-floor story over the whole site made 2ft. higher. Increased accommodation has been given the caretaker on top floor, and much more extended basement; likewise a large oriel window projected out from reading-room, which was not shown in the perspective view published.

These alterations, additions, and improvements, made at the committee's suggestion, more than account for the difference in the original estimate and the accepted tender, and I fairly warned the committee before making the alterations of the increased cost entailed thereby, and since they are satisfied I do not see why an unsuccessful competitor should make so great an outcry, reminding one so much of the old fable of the Fox and Grapes. Perhaps another time he will be more careful in compiling his statements. Your correspondent seems to imagine that a competition set of drawings must be carried out line for line: otherwise, he evidently thinks gross injustice will be done to unsuccessful competitors. Fortunately, committees have not such narrow views, and I trust he will learn more wisdom with further practice.—I am, &c.,

Henry A. Cheers.

Sir,—Referring to your correspondent's remarks on the Scarborough Club Competition, perhaps I may be allowed, as one of the competitors, to relate my experience in the matter. Finding from my preliminary rough sketches that the building could not be carried out for the money to which architects were limited, I wrote to the secretary stating that it was quite impossible to provide all the accommodation desired for that sum. He advised me, notwithstanding this, to submit my designs and state the amount for which they could be executed. I did so; but I infer from your correspondent's letter that the same amount of liberty was not accorded to other competitors.

I fear it is too much the practice for building committees to name haphazard sums as their limit of expenditure, trusting that architects may be able to conjure buildings into existence by some occult faculty they are supposed to possess.

Other things being equal, certain classes of buildings, such as churches and hospitals, *may* have limits of outlay assigned them beforehand; but this is not the case with buildings like the Scarborough Club, and my point is this: that competing architects, on finding at the outset of their labours that they cannot carry out their scheme for the money, should frankly tell the committee so.—I am, &c.,

A. S. G.

ARBROATH ABBEY.

Sir,—I observe in last week's issue of one of your contemporaries a view of the south transept of Arbroath Abbey. The accompanying letterpress, which describes it as the Chapel of St. Catherine, is, however, in error. Even if it had been the practice—which it was not—to place chapels in the transepts, they could not in that position have had their "orientation" carried out.

In the instance of Arbroath, the mistake about the dedication of the south transept to St. Catherine is a popular one, perpetuated by the worthy keeper of the ancient fabric in his description to visitors.

In Arbroath Abbey there were six chapels with their altars, in addition to the high altar in the presbytery. These chapels were in the aisles of the presbytery and transepts. The only one which can be localised is that of St. Mary, which was in the south aisle of the presbytery.

Any of your readers interested in the valuable ruin will find a plan of it in one of the back volumes of the Building News (1885) reproduced from my work on "Three Scottish Abbeys."—I am, &c.,

Tooting, Nov. 28th. G. S. Aitken.

ARCHITECTURAL POLITICS.

Sir,—Your correspondent, "G. H. G.," has made a series of statements in his communication of last week which, with but few exceptions, are more or less inaccurate, some absolutely; and as two or three of these apply to and affect the subject of my letter upon "Professors of Sanitation," I cannot possibly allow them to pass unchallenged.

In his opening remarks we are informed that there is something *special* about sanitation. We object to such a statement. Drainage, like water supply, ventilation, warming, &c., is part and parcel of the building, and the architect who has designed every inch of and erected the building is *par excellence the* man competent by virtue of the position, above all others, to superintend it. To this we adhere, and certainly pay no attention to the financially interested argument of the "sanitary *expert*," which latter term, applied to house drainage or sanitation, is equally absurd as that of *professor*.

The following statements, "that, among other correspondents, one has defended the profession from the charge of ignorance in sanitary matters; that another has *boldly* denied their attainments; that this controversy has risen from misapprehension; that it has been assumed that architects are acquainted with sanitary principles because few and simple; and lastly, that because a few individuals have mastered the science others must not be assumed by us to have done so," are all misapprehensions proceeding from one person only—your correspondent, "G. H. G." We do not defend the profession from the charge stated, but *do*, and have, defended it from the remarks of Mr. Hugh Roumieu Gough, whose arguments by no means *hold* respecting "so-called architects," which in principle is simply to state that incompetent men are not competent men; that "quacks" are not qualified doctors; we thank him for the information—colloquially worded and sufficiently equivocal to afford a loophole of escape—leaving the damaging impression upon the public mind that architects as a body are utterly ignorant of sanitary science. It is simply absurd. We have not remained, and *shall not* remain, passive while Grimthorpean hands are being laid upon the profession. In all of this we cannot but discover a lamentable absence of that *professional etiquette* which is found so efficacious in maintaining public confidence in other professions. The assumption following this was never made; nor were we so illogical as to generalise from our own attainments in sanitary science to other members of the profession.

The Public Health Act is in active operation where in large towns sanitary science is of importance to the community, and within such area 100 per cent. (!) of the houses now erected are in perfect sanitary condition, for no vestry will allow any house-drain to be laid down without being properly disconnected and ventilated. Therefore, I regard the statement "of 70 per cent. at least (!) of the houses now built being as regards sanitation in a fever-breeding condition—that is, the laying on of sewer gas," a pure mental fabrication, which, to support your correspondent, has made a totally irrelevant allusion to the exploits of the suburban "jerry-builder." What has *that* to do with the sanitary knowledge of architects?

We do not consider the profession as going through anything, or anything approaching thereto, of a revolutionary character. On the contrary, a steady progressive development. Nor can civil engineers who have assisted architects in iron construction—but who will assist them much less in future, if not altogether be dispensed with—be considered as "specialists," for from this point of view an architect is also a specialist.

With the last paragraph of "G. H. G.'s" letter I wholly concur.

Lord Grimthorpe's suggestion in the *Times* is as ridiculous as usual. I have served articles to one of the largest builders in London, and therefore do not speak empirically.

I think, Mr. Editor, that something practical should be the upshot of this controversy. I suggest, therefore, that a class be formed at the Association for the study of Sanitary Science, including the ventilation and warming of buildings, water supply and sanitary appliances, which are of more importance than stereotomy, colour decoration, and graphic statics combined.—I am, &c.,

Chas. R. Guy Hall.

15, High-street, Kensington.

ASSISTANT SURVEYORS R.E. DEPARTMENT EXAMINATIONS.

Sir,—I find in the list of subjects set for examination of candidates for the situation of Assistant Surveyors R.E.D., there is not a single subject on surveying, save quantities. Now, probably, the first duty that a surveyor on entering service may have to perform, is that of making a survey of some land, or of a rifle range. To do this it is absolutely necessary, therefore, that an acquaintance should be possessed by the surveyors, while in dealing with work connected with a rifle range, it is imperative they should have a sound knowledge of levelling. Instead of this, a surveyor may enter the service and be totally ignorant of what a theodolite is, or even a Gunter's chain.

What I would suggest is that subjects on the "Use of Surveying Instruments," and "Modern Sanitation" be added, and either trigonometry or Euclid could well be dispensed with. This change would greatly benefit the surveyors, and they could then enter with confidence on their duties. Prospero.

Intercommunication.

QUESTIONS.

[9481.]—**Geometry.**—Which is the best and simplest treatise on geometry in order to get up for an examination (architectural) comprising elementary, plane, and solid geometry? I have been accustomed to architectural drawings, &c., for some time, but have no knowledge of the terms or regular problems.—F. R.

[9482.]—**Products of Gas Combustion.**—Carbonic acid = $C . O^2$ = carbon dioxide. I think that is right, but am not quite certain. Carbonic oxide = C . O. Is that correct? Which of the two is the result of combustion by the atmospheric or "Bunsen" flame, and which the result of the ordinary illuminating flame? Which is the most poisonous by inhalation?—W.

[9483.]—**Cast-Iron Columns.**—Is there any simple formula for calculating the strength of these? Barlow, on the "Strength of Materials," 1867, says, "The only experiments that have been made upon cast-iron columns are those by Mr. Hodgkinson," and afterwards gives the formula, which is complicated. A simple method would be a boon to architects, including—A. Bearer.

[9484.]—**Chesterfield Churches.**—In a journey from London recently on the Midland Railway I noticed this remarkable spire seems to be more twisted than ever. What is the primary reason for the ugly warping of its timbers?—G. C.

[9485.]—**Old Irish Fonts.**—Where can good examples be seen?—G. C.

[9486.]—**Earl Strongbow.**—Is the tomb of this celebrated warrior still preserved in Christ Church Cathedral, Dublin? It was there before the late Mr. Street's restoration some ten years ago.—G. C.

[9487.]—**Mounting Water-Colour Sketches.**—Will some reader kindly inform me of the best method and description of material to use in mounting water-colour sketches on cardboard mounts so as to prevent the colours from running if the backs are wetted in the process, and for them and the mount to remain perfectly flat when finished? Also the mode of strengthening sketches for fixing to the backs of mounts having an opening for the subject.—Art.

[9488.]—**Gate and Right of Way.**—A man has a gate opening upon a right of way. I should be pleased to know if he can remove the gate to a different position in the same wall.—G. Wyborn.

[9489.]—**Billiard-Room Light.**—Wanted one for oil, which will give less trouble than an ordinary six-armed one, and not cast any shadow? Have heard of a room lamp in use in America in the form of a gasalier, the oil container being in centre and the oil conducted along arms to wicks as gas to burners. Has this principle been applied to above?—J. M. H.

[9490.]—**Measurement of Shafts.**—Will some experienced reader kindly give an opinion as to the following query? In the erection of a large building of the warehouse type, a chimney-shaft 5ft. 5in. square and 60ft. high, and having a circular flue, is built on the side of the said factory. In the architect's quantities the brickwork of shaft is not separated from that of the main building, but included in the bulk, and one price is allowed by the contractor for the whole. The only extra in quantities is as follows: "Wire-cut bricks in gauged mortar lining to flue of shafts." On completion of contract the brickwork is measured, and the architect deducts the flue of shaft (diameter of which is 2ft. 6in.) from the bulk of brickwork. The contractor argues that this ought not to be, as nothing is allowed in quantities for extra labour in erecting shaft. Ought the flue to be deducted? If so, should not an extra price per rod be allowed for erection of shaft?—Q.

[9491.]—**Valuation.**—The value of house and ground rent being assumed to be correct, should the ground rent be deducted from the valuation—in valuing for mortgagee, or not, in case of leasehold? I put a hypothetical case. Thus, a house cost, and is worth, say, £2,300. Standing on land ground-rented at £35 per annum, with option of purchase of freehold, at 25 years = £875, will the value for mortgagee be £2,300, or less the capitalised ground-rent—viz., £1,425? Clearly, if it were freehold, the value is £2,300 × £875 = £3,175; or, if the house is let at, say, £150, should the ground-rent of £35 be deducted? Thus, £150 − £35 = £115 × 14½ years' purchase, to pay 7 per cent. = value £1,639. Or should the rent £150 be × 14½ = value £2,137 10s. 4d.—Mortgagee.

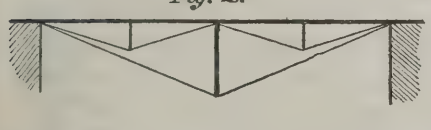
[9492.]—**Architectural Perspective.**—Will any of my professional brethren kindly inform me if a knowledge of second-grade linear perspective of the Science and Art department is sufficient for architectural drawing? Or, if not, are any handbooks published that are useful to architectural draughtsmen, and if London assistants are expected, as a rule, to know the subject?—Station Point.

REPLIES.

[9450.]—**Masonry and Stonecutting.**—Referring to the respective methods (see p. 643, Figs. 3 and 7), I invite the readers of the Building News to test them. Cut a templet similar to the section of the prism, and taking two rough pieces of suitable material, proceed to

"dress" them to the required form, following respectively each method. Both agreeing as to first dressing, setting bed, then one of the ends of prism; cut these on both models. With No. 1 model proceed by marking templet on the squared end, and working in rotation from the setting bed each of the sides of prism by repeatedly squaring and "taking out of twist" the drafts at the rough end, completing the model by "measuring off" the required length and "squaring up" the rough end. With Model No. 2 (already partially dressed) continue by "measuring off" and "squaring up" the rough end, applying the templet to both ends similarly; mark off, or rather cut in each angular corner, completing model by bringing each surface in rotation to a plane, using only the straight-edge. The value of the latter method—always adopted for mouldings, &c.—is obvious; while the rough end of the former method in practice depends on (1) the extreme accuracy of long-bladed and too-often ill-used squares; (2) their just application; and (3) a series of accurate twistings; but these operations, unneeded by second method, involve a loss of time, sometimes a loss of material, or worse, bad work. I was pleased to learn that the latter method (see Lesson II. p. 751) is the one Mr. Harvey adopts. I may remark it is general in practice, and that I taught it in '82, before the subject was added to the City and Guilds list. Mr. Harvey states, "archstone applies only to arches." Read article on "Metropolitan Railway Bridges," p. 774, and discriminate between vault and arch in principle. Mr. Roger Smith, in his work on "Gothic and Renaissance," defines "vault" as "an arched ceiling," &c.; Newland as "a continued arch or an arched roof." Dobson (in the work referred to by Mr. Harvey), under "Vaulting," states:—"Arched vaults being found amongst the ruins of Nineveh," &c. Alluding to the principle of dome vaulting that it was "evaded by making the beds horizontal throughout," and, again, "the introduction of the arch as a leading principle in composition," Mr. Harvey states, "Voussoir applies to the stones which form the surface of any vault, whatever its shape may be." I submit the soffit is no criterion. The soffit of an archstone is not necessarily a rectangle; and, further, I am not aware of any stone to which the term "voussoir" applies, whose right section in the plane of the "line of resistance" is not of the arch or wedge form. Mr. Harvey rightly stated (see page 642) "the intrados, but more commonly the soffit." He might have continued, "the extrados or back" (see back on oblique arches), and following in the same wake "Voussoir," but more commonly "springer" or "archstone," for the former in each of these instances are rare indeed in the workshop, "bank," or building; and while Mr. Harvey is not responsible, except for sustenance, I submit there was no necessity for the importation. In conclusion, while thanking Mr. Harvey for the kind manner he has accepted my criticisms, I trust my object is apparent, that now the City and Guilds and other munificent bodies are using their exertions to open the doors of technology to all, we shall not find the architects have designed the steps of the main staircase; that all are invited, nay, urged to ascend 11in. risers and 24in. treads; for while I admit there are those to whom "strictures" should not be necessary, there are others who, if such terms must first be mastered before they can apply themselves to a study of principles, will be doubly handicapped. — JOHN POWELL.

[9466.]—**Early Churches.**—I am obliged for "H. D. W.'s" reply. My question had reference to parish churches rather than to cathedrals. The latter churches named by "H. D. W.," especially Wing, Bucks, St. Michael, St. Alban's, Repton, and Brassington, are unknown to me, and I should like to know if they have been published.—STUDENT.



[9469.]—**Fink and Bollman Trusses.**—A Fink truss is one in which the diagonals or tension-bars are inverted, forming a series of inverted trusses below a compressive horizontal member or chord. In the Bollman truss the same arrangement of tension members exist, the diagonals proceeding from each end of the chord becoming longer and longer till the farthest vertical is reached. The stress in the upper chord is constant in this case. For finding stresses consult Bold's work, or Rankine's manual.—G. H. G.

[9469.]—**Fink and Bollman Trusses.**—Sketches show the forms of these trusses. Fig. 1, Bollman; Fig. 2,

Fig. 1.

Fig. 2.

Fink. It would require too much space to explain methods of finding stresses. Better consult Trautwine's "Pocket Book" (J. Wiley and Sons, New York, 21s.) and Graham's "Graphic and Analytic Statics" (Crosby Lockwood and Co., 16s.)—PHOS.

[9474.]—**Ordnance Maps.**—The undermentioned book, published at the Ordnance Survey Office, Southampton, will give "P." the information he requires—"Descriptions of Scales, Characters of Writing, and Boundary Symbols, Abbreviations, &c., used on the Ordnance Survey Plans of $\frac{1}{500}$, $\frac{1}{2,500}$, and 6in. to 1 Mile, Past and Present."—C. W. GREY.

[9470.]—**Gas-Lighting for Draughtsmen.**—Use the "Welsbach" light made by the Incandescent Light Company, 15, Leadenhall-street, E.C., which gives a white and steady light, and saves smoke and dirt—very essential conditions to all who have to draw on white paper. Indeed, I do not know any steadier or more economical light for night work.—G. H. G.

[9476.]—**Symbols.**—If Mr. W. Jones will expend a few shillings in a useful little well-known book called "The Calendar of the Prayer-Book," by Parker, he will have at his finger's end a good deal of information relative to Saints and their Symbols. The emblems of the Four Evangelists, as quoted by him, were used from an early age, and are derived from the visions of Ezekiel and St. John, recorded in Holy Writ as follows:—"As for the likeness of their faces, they four had the face of a man, and the face of a lion on the right side; and they four had the face of an ox on the left side; they four also had the face of an eagle." "In the midst of the throne, and round about the throne, were four beasts, full of eyes before and behind. And the first beast was like a lion, and the second beast like a calf, and the third beast had a face as a man, and the fourth beast was like a flying eagle." "The Calendar of the Prayer-Book" says the significations generally applied to them are as follows:—"The Angel, or human form, to St. Matthew, because his Gospel seems to dwell most particularly upon the human nature of Our Lord, and commences with His human generation and descent; The Lion to St. Mark, because he is termed the historian of the Resurrection, of which doctrine the Lion was considered the emblem, from the legend that it was always born dead, and after some days licked into life by its parents; The Ox or Calf to St. Luke, because, being the emblem of sacrifice, it is the sign of a priest or victim; and St. Luke especially dwells upon the priestly character of Our Blessed Lord; The Eagle to St. John because, as the eagle soars highest amongst birds, and looks undimmed at the sun, so St. John soared upwards beyond all the other inspired writers in setting forth the divine nature of Our Lord, and contemplating the glory of His godhead; and for this reason St. John is often represented soaring upwards mounted on the back of an eagle." Mr. Jones will find much more information upon the same subject in the book just quoted from; but the matter is so generally known that I forbear to reproduce it in extenso. In Mrs. Jameson's "Sacred and Legendary Art," Vol. I., he will find exactly fifty pages devoted to the subject. Therein the gifted authoress says the earliest type under which the Four Evangelists are figured is simply by four scrolls placed in the four angles of a Greek cross. The second type chosen was the four rivers which had their source in Paradise. Representations of this kind, in which the Saviour, as a lamb holding a cross, stands on an eminence, from which gush four rivers, are to be met with in the Catacombs, and in some old 2nd to 5th century churches. The Jewish doctors originally interpreted the creatures Ezekiel saw as the four archangels—Michael, Raphael, Gabriel, and Uriel; and afterwards as the Prophets—Isaiah, Jeremiah, Ezekiel, and Daniel. At what precise period the quartette of mysterious emblems were first adopted as significant symbols of the Four Evangelists, Mrs. Jameson does not venture an opinion. It was certainly as early as the 5th century.—HARRY HEMS.

[9476.]—**Symbols.**—The four living creatures mentioned in Ezek. i. 10, x. 14, and Rev. iv. 7, have been applied to the Four Evangelists from very early times, though I believe representations of them are not found earlier than the 5th century. Their symbolism is variously explained by different writers. SS. Jerome and Augustine refer the Man (the man is drawn with wings, hence it is sometimes called an angel) to St. Matthew, because his Gospel commences with the human genealogy; the Lion to St. Mark, in reference to his opening with the cry in the wilderness; the Ox to St. Luke, from his beginning with the sacrifice of Zacharias; and the Eagle to St. John, whose first words were, "In the beginning was the Word." Others have attributed the Man to St. Matthew, because he treats of the humanity of Christ; the Ox to St. Luke, because he dwells on the priesthood and passion of Our Lord; the Lion to St. Mark on account of the rapid and abrupt style in which his Gospel is written; and the Eagle to St. John from his lofty and far-reaching flight of inspired thought. The symbols are all drawn with the nimbus or "glory," and they are often represented as holding books of the Gospels. No precise rule or order of arrangement is observed, and their design and application is constantly varied. They are frequently placed at the ends of the cross, where they are intended to bear witness to the Godhead and humanity of Christ.—A. C. W.

[9477.]—**Lime-Washed Walls.**—In answer to the query by "Limewash," I send the following recipe:—To every 25 or 30 gallons of run lime, add one gallon of boiled or linseed oil and one pound of Russian tallow, the whole to be thoroughly incorporated, and must be applied while hot.—R. W. C. D.

A special meeting of the Margate town council was held on Tuesday, when it was decided to adopt a new system of drainage for the borough, and that the work should be carried out with all possible despatch. It was stated by the borough surveyor that if a system of drainage by gravitation was adopted, the work of draining the low levels of the town could be completed before the commencement of next season. A committee was appointed to visit Eastbourne, Henley-on-Thames, and Southampton to inspect the Shone system, as well as other towns where other drainage schemes have been satisfactorily adopted.

The mason-work of the model dwellings in course of erection for the Glasgow Corporation in Saltmarket was completed by the contractors, Messrs. Webster, Walker, and Webster, on Saturday.

A south transept has just been added to the Chapel of Ipswich Grammar School, at a cost of £400. It is built, in keeping with the chapel, of red brick with stone dressings, the style being Late Perpendicular. Mr. Brightwen Binyon, F.S.A., of Ipswich, was the architect; and Mr. F. Bennett, of the same town, the builder.

STAINED GLASS.

ECCLESTON.—Two single-light memorial windows have just been placed in Christ Church, Eccleston, near Prescot, Lancs, by Mr. Douglas Herman, of St. Ann's, St. Helen's, in memory of his father and mother. Each window consists mainly of a full-length figure, the lower portions being occupied by groups illustrating incidents in the lives of the personages depicted above. The subject of the western window is "Dorcas," represented as a young woman. At the base is shown the distribution of garments to the widows, and at the head is a group typifying Charity. The subject treated in the second window is St. Luke, represented as the Evangelist, with pen and inkhorn, and below as an artist painting a picture of the Virgin with the Infant Saviour. The subject of St. Luke is peculiarly appropriate in a memorial of the late Mr. R. W. Herman, who from early manhood took an active interest in the movement for developing art training in Great Britain, having been instrumental, in company with a few other earnest students in the Government School of Design, Somerset House, in securing some very necessary reforms in the mode of training, which resulted in his being placed on the staff when the school, by gracious permission of Her Majesty, was established at Marlborough House in 1852. On the removal of the National Art Training School to South Kensington Mr. Herman was appointed deputy head master and lecturer on the principles of ornamental construction. Subsequently, as registrar, he took an active part in organising the vast establishment at South Kensington. The windows are from the studio of Mr. A. W. Hunt (Shrigley and Hunt, Lancaster and London), who was himself a student at South Kensington during the later period of Mr. R. W. Herman's connection therewith.

CHIPS.

According to the *Staffordshire Advertiser*, the school board for West Cannock, having considered the overcrowding at the West Hill Schools, it was resolved that the present infant school be added to the girls' department, and a new infant school to accommodate 300 children be built, the cost not to exceed £4 per head. Mr. F. W. Evans, architect, of Birmingham, was engaged to carry out this scheme for £26 5s., "with an additional £10 if the work is done to the satisfaction of the board."

A new town hall is approaching completion at Maybole, N.B. It is Scottish Baronial in style, and will cost £3,000. The chief apartments are the council council, 38ft. by 16ft., and the concert-room, 70ft. by 33ft. and 33ft. in height.

The construction of a marine promenade at Bridlington Quay has just been commenced. Since the tender of Messrs. Whitaker Bros., of Horsford, was accepted about a month ago, the work has been carried on night and day, and there is every probability of it being completed by June next. The wall forms a connecting link with the existing promenades on either side of it, and will be joined to the Alexandra Sea-wall, thus forming one continuous marine walk of nearly three-quarters of a mile in length, the greater portion of which will have a carriage drive 40ft. wide.

The International Exhibition at Melbourne is arranged to be opened on August 1st, 1888.

An addition to the churchyard of Stoke Poges was consecrated on Wednesday week. The iron rails which surrounded the graveyard, well-known to all visitors to Stoke, have been removed, and there is now instead a sunken fence of flint stones with ditch, while at the entrance has been erected a lych gate designed by Mr. J. Oldrid Scott.

Decoration, published since its first issue, more than seven years ago, by Messrs. Sampson Low, Marston, and Co., will, after the December number, be published by Mr. P. L. Deighton, late publishing manager to Messrs. Crosby Lockwood and Son. Mr. Deighton has recently relinquished his position with that firm, and taken offices at 6, York-street, Covent-garden, to which address all future communications should be forwarded. He promises a considerable enlargement of the journal and the addition to it of several new and interesting features early next year. Mr. Moyr Smith will continue to act as the art editor of *Decoration*.

At a meeting on Monday night of the Architectural section of the Philosophical Society of Glasgow, Mr. James Thomson, president, in the chair, an address on "The Training of Architectural Students" was delivered by Mr. F. H. Newbery, of the Glasgow School of Art.

An enormous circus of wood and brickwork is being constructed at Manchester at a cost of £10,000 for the reception of Buffalo Bill and his Wild West. The architects are Messrs. Mangnall and Littlewoods, of Manchester; and the contractors Messrs. R. Neill and Sons, of the same city, the builders of the late Royal Jubilee Exhibition.

LEGAL INTELLIGENCE.

In re Wm. Douglas.—(London Court of Bankruptcy, Nov. 28. Before Mr. Registrar Linklater.)—The debtor, described as of Queen's-gate-terrace, South Kensington, and elsewhere, builder and contractor, has presented his petition, and a receiving order has been made. The aggregate debts are estimated at £675,000, of which about £575,000 are covered by securities, the trade debts being returned at about £17,000. The amount of the assets did not transpire.

Dilapidations.—Battam v. Knight.—This case was heard before the official referee on Friday last. The plaintiff claimed £108, the defendant paid into court £15. The counsel engaged were Messrs. J. V. Austin and R. M. Bray. The surveyors for the plaintiff were Messrs. Kingwell Cole, Battam, and Delissa Josephs; for the defendant Messrs. H. J. Thurgood, E. H. P. Eason, and Banister Fletcher. Verdict for the defendant, with costs.

Novel Swindle on Builders.—James D'Arcy Phillips, described as a journalist, of Bath, was charged at Leamington on Friday with obtaining £1 by false pretences from Mr. John Fell, contractor, the mayor of the borough. Evidence was given showing that the prisoner advertised to the effect that the Boyle trustees, an imaginary body, purposed building villas in the locality where the advertisements appeared, and it was stated that plans and specifications would be supplied on £1 being deposited, to be returned if a genuine tender was received. This being an ordinary condition, Mr. Fell's manager sent the deposit money, but never received the plans or specifications. Inquiries were instituted through the Bath police, and then the prisoner returned the money, intimating that legal difficulties had suspended the project. When arrested, several postal orders and cheques were found in his possession. Numerous others had been returned. The prisoner's address in Bath was merely a room, and there were no traces of either plans or specifications. The bills of his advertisements were unpaid. Prisoner was remanded.

CHIPS.

Plans and specifications for the restoration of the "Muckle Cross," at Elgin, prepared by Mr. Sydney Mitchell, Edinburgh, were submitted to the town council of that burgh on Monday, and approved of. The cost will be over £300, to be defrayed by Mr. M'Andrew, Westwood House, Essex, a native of Elgin.

The corner stone of a new Church Sunday school and club for East Twerton, near Bath, was laid on Tuesday. The building will cost £3,000, and will comprise a schoolroom, 64ft. by 36ft., a reading-room, 24ft. by 31ft., a committee-room, 19ft. by 24ft., and three classrooms. Mr. E. W. Buckle is the architect.

The residuary legatees of the late Sir Joseph Whitworth have devoted £47,000 to the purchase of 20 acres of land between Oxford-street, Denmark-road, and Moss-grove, Manchester, for a city park, and the building of a technical school and art and commercial museum. Among the conditions allotted to the gift is one that a sufficient stipend be provided independently to enable Owens College to fill and maintain a Professorship of Art and Architecture, whose lecture-room and library shall be provided within the Museum of Art. Galleries for architectural illustrations are to be arranged for in this museum.

The *Court Circular* states that at Windsor Castle on Tuesday, Mr. Minton, of the firm of Minton and Company, was introduced to the Queen, and presented to her Majesty a vase illustrative of the principal events of her Majesty's reign during fifty years, manufactured at the works of the company, which her Majesty was graciously pleased to accept.

Mr. W. Holman Hunt was elected a member of the Royal Society of Painters in Water Colours on Wednesday.

The throne-chair of Queen Hatasu (xviii. Egyptian Dynasty, B.C. 1600), has been presented to the British Museum by the owner, Mr. Jesse Haworth, of Bowdon, Cheshire. The throne-chair is believed to be the only extant specimen of ancient royal Egyptian furniture, and is the most venerable piece of dated cabinetmaker's work in the world.

The prize of the Manchester Society of Architects for the best essay descriptive of the architecture of the Manchester Town-hall has been awarded to Mr. Percy Scott Worthington, of B.A., Corpus Christi College, Oxford, son of Mr. Thomas Worthington, of Manchester. The prize is the gift of Mr. Murgatroyd, the president of the Society. The Manchester Society of Architects' prize for the best collection of sketches has been awarded to Mr. Sidney M. Fairlie, Lansdowne-road, Didsbury.

Our Office Table.

Colonel Duncan, R.A., C.B., has consented to take charge of the Registration Bill next Session in the House of Commons, and all that is now wanted to insure its passage is the pecuniary support of the profession. The Society of Architects—which is a young society and not very rich yet—has already contributed quite as much as its finances warrant towards the preliminary expenses, and besides, it is only fit that the Registration Committee, which was appointed by the profession, should depend now on the profession for support, and not on any one society. The committee appeal elsewhere for subscriptions towards the necessary Parliamentary expenses, and if architects believe in Registration, now is the time to show their opinion. With a thousand pounds subscribed, and the zealous co-operation of the principal architectural societies, the Bill might be law this day six months.

The agitation for the reform of the Royal Academy, which has been smouldering right through the year ever since the unprecedented revolt of last autumn, has at length, says the *Magazine of Art*, reached an acute stage. It will be remembered that the first measure of reform demanded was that the total number of works that each artist might submit to the selecting committee for the purpose of exhibition should be reduced from eight to two in each class—oil and water-colour painting, sculpture, architecture, and black-and-white. The entire Press supported the proposal, and the Academy had just appointed a reform committee to consider it, when Mr. Holman Hunt, Mr. Walter Crane, and Mr. George Clausen arose in their wrath, and, after a defiant trumpet-blast, called upon the Academy to clear the way, and enunciated a plan for a "National Exhibition." Since that time Mr. Walter Crane has seceded from his less radical companions, and the others have wisely returned to a more moderate programme, consisting solely of the establishment and introduction of the democratic principle in the appointment of the Selecting Committee—the detail of the reduction of numbers being laid aside for a time in favour of the principle of suffrage. A memorial has been addressed to the President and Council of the Academy by Mr. Havard Thomas, the honorary secretary of the Provisional Committee, signed by 783 artists who have signified their adhesion to the principle "that the juries for selecting and placing works of art must be selected from and by the artists of the kingdom."

An exhibition of the Chinese and Japanese engravings belonging to Dr. Anderson, formerly of the British Legation in Japan, and author of a recent well-known work on the Piscatorial Arts of Japan, will shortly be on view at the Burlington Fine Arts Club. It is intended that the collection shall be the most complete ever yet exhibited in Europe, and that through it a new chapter shall be added to the history of engraving. The collection will include dated and authentic works belonging to the early part of the 14th century (the oldest European engravings known belonging to the 15th), and one nearly 100 years older, which is authentic, but not dated. The Japanese chromoxylographs in the collection form a complete series, from about A.D. 1700 down to the present year, of remarkable beauty and colour, and some of these in black and white are almost unrivalled for force and delicacy. The earlier specimens have never been seen before in this country, or, indeed, out of Japan. There are also some examples of engraving on copper, and a recent chromolithograph production of remarkable merit. The large collection of examples of the Japanese pictorial arts, which was purchased from Dr. Anderson by the nation a few years ago, is at last being arranged in the British Museum, and will probably be opened early in January next.

In the death of Dr. Thomas U. Walter, the late President of the American Institute of Architects, at the age of 83 years, the profession in the United States has lost the last tie which connected it with the traditions of the Classical Revival, and a member who had for sixty years maintained the dignity of the calling which he practised, and influenced for good not only his professional brethren, but the sentiment of the general public towards the art. Thomas U. Walter, LL.D., was born in Philadelphia, and was placed as a pupil with William Strickland, perhaps the most distinguished American architect of his time, under whom he studied the antique with such zeal and success as to make himself probably the best Classical architect who has ever lived in America. His first important opportunity came with his appointment as architect of the Philadelphia County Prison, begun in 1831, and two years later he won the first place in the competition for the Girard College buildings, and in 1851 he was appointed architect of the Capitol Extension at Washington, and succeeded in converting an insignificant building into an imposing edifice. Finding the old Capitol constructed of decaying sandstone, with what must be regarded as questionable taste he had it painted white, but constructed the new wings of white marble, of extraordinary hardness and durability. The dome, which completed Mr. Walter's additions to the building, although of iron, is of fairly good outline and proportion. Mr. Walter, while in Washington, also designed and executed the new front of the Treasury Department, the wings of the Patent Office, and the extension of the Post Office, besides a Government Hospital for the Insane. On returning to Philadelphia, after the inauguration of the new plan of committing the architecture of public buildings to an official at a small salary, Dr. Walter was appointed Professor of Architecture at the Franklin Institute, and was soon after chosen to co-operate with Mr. McArthur in the construction of the immense Public Building of Philadelphia, the tower of which, when completed, will be the loftiest in the world. On the death of Mr. Richard Upjohn, the first President of the American Institute of Architects, he was appointed his successor, and held that office until the present autumn, when he retired.

The election of two pensioners on the funds of the Builders' Benevolent Institution took place at Willis's Rooms, St. James's, on Thursday, Nov. 24th, Mr. Herbert H. Bartlett, the president, in the chair. There were only four candidates for the two vacancies—viz., three men and one woman. The poll was open from 2 to 4 p.m., shortly after which the scrutineers, Messrs. Thomas Stirling and S. F. Rider, announced the following results:—James Pickering, 25, Shillington-street, Clapham Junction, aged 61, builder (fourth application), 1,018 votes; G. N. Cott, 12, Mordaunt-street, Brixton, aged 69, builder (third application), 1,497 votes; J. B. Axford, 2, Brosley-terrace, Stroud Green, aged 63, builder (first application), 2,306 votes, including 300 added in respect of former contributions; and Ann Winter, 47, Maygrove-road, Brondesbury, aged 62, widow of Benjamin Winter, builder (second application), 1,235 votes, including 210 added for her late husband's contributions. The successful candidates were, therefore, declared to be G. N. Cott and J. B. Axford.

The Rev. George Forrest Browne, B.D., of St. Catherine's College, was elected by the Vice Chancellor and Heads of Houses of Cambridge University (in succession to Mr. Ernest Gardner, now of the British School of Archæology at Athens), to the Disney Professorship of Archæology for a period of five years. Mr. Browne is best known as the secretary to the Cambridge local examinations, an office he has filled for many years. As an archæologist and antiquarian he has attained considerable reputation. He has been president of the Cambridge Antiquarian Society and a constant contributor to its proceedings. The value of the professorship is about £100 a year. The duties are to deliver six lectures at least during the academical year on the subject of Classical, Mediæval, or other antiquities, the fine arts, and all matters and things connected therewith.

Princess Christian will unveil on Friday, the 15th inst., the statue to the Queen which has been erected at the Royal Holloway College, Egham.

The deposit of plans for private Bills intended to be proceeded with next Session was completed on Wednesday night. The total number of plans deposited is 157, which are divided as follows:—Railways, 58; tramways, 15; provisional orders, 38; miscellaneous, 46. Last year the total was 132, consisting of 47 railways, 12 tramways, 40 provisional orders, and 33 miscellaneous.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Association of Public Sanitary Inspectors. "The Duties of Port Inspectors of Nuisances," by Dr. W. Collingridge. 6 p.m.

MONDAY.—Society of Engineers. "A new Formula for the Flow of Water in Pipes and Open Channels," by E. C. Thrupp. 7 30 p.m.

Royal Institute of British Architects. "The Auditorium of a Theatre," by Ralph Nevill, F.S.A. 8 p.m.

Surveyors' Institution. "Allotment Legislation," by R. Rich; "Allotments and Small Holdings," by M. Jeans. 8 p.m.

Clerk of Works' Association. "Groined Vaulting," by E. Moore, Carpenters' Hall. 8 p.m.

TUESDAY.—Institution of Civil Engineers. 8 p.m.

WEDNESDAY.—Civil and Mechanical Engineers' Society. Inaugural Address by the President, R. E. Middleton, Westminster Town Hall. 7 p.m.

Society of Arts. "Chemistry, Commerce, and Uses of Eggs," by P. L. Simmonds. 8 p.m.

THURSDAY. — Edinburgh Architectural Association. "Italian Monuments," by J. Wallace. 8 p.m.

ARCHITECTS' AND ENGINEERS' BILL.

The ARCHITECTS' and ENGINEERS' REGISTRATION ACT COMMITTEE invite all who are interested in the Passing of the above Bill to CONTRIBUTE towards the NECESSARY EXPENSES incidental thereto.

If this appeal is met with a ready response, the Bill will be presented to Parliament early next session by

COLONEL DUNCAN, R.A., C.B., M.P.,

who has kindly undertaken to pilot the Bill through the House, backed by other prominent members.

Subscriptions of all amounts, however small, will be acceptable. All subscriptions over £1 will be publicly acknowledged, and all subscribers will be supplied with a Copy of the Bill gratis.

EDGAR FARMAN, Hon. Sec.

J. WATSON MOYSES,
ROBERT WALKER, M.S.A., A.M.I.C.E.,
HUGH ROUMIEU GOUGH, M.S.A., F.R.I.B.A., } Treasurers.

39, King-street, Cheapside, London, E.C.

To Practical Masons.—The President and several members of the council of the Royal Institute of British Architects and the proprietors of the BUILDING NEWS offer prizes of Ten Guineas, Five Guineas, and Certificates for the best models of vaulting at the angle of a cloister. For lessons, inquire Class of Masonry, Guilds Institute, South Kensington, Monday evening, between 8 o'clock and 9 o'clock.

CHIPS.

For six weeks workmen have been engaged planting trees at Fintrie Bay, Cumbrae, at the expense of the Marquis of Bute, and now the town of Millport is beautified in the same way, planting operations having been begun this week in the West Bay, Millport, along the face of a hill extending nearly three-quarters of a mile in length.

The first section of the Loose Valley and Headcorn extension of the South Eastern Railway, that from Maidstone to Tovil, was formally opened last week.

St Thomas's Church, Pendleton, Manchester, a building erected 56 years since in the phase of Perpendicular then current, was opened on Friday after internal rearrangement and restoration from plans by Mr. Medland Taylor, of Manchester.

A new Wesleyan chapel at New Brompton, Kent, was opened on Wednesday week. It has been built by Mr. C. E. Skinner, of Chatham, from plans by Mr. Margetts, of the same town.

A memorial tablet has been placed in Windsor Presbyterian Church, Belfast, to commemorate Mr. Robert McQuiston, who bequeathed £6,000 for the erection of the building. The memorial takes the form of a brass of the 15th century, inclosed in a framework of black and green marbles, moulded and carved. The brass within is engraved with a Gothic border and upper panel, showing a shield with vine leaf enrichments. The design has been executed by Messrs. Purdy and Millard, Wellington-place, Belfast, from designs by Messrs. Young and Mackenzie, the architects of the church.

Out of 62 candidates, Mr. Hughes, inspector of nuisances under the Bangor Corporation, has been elected to a similar appointment under the Bridgnorth rural sanitary authority.

The town council of Glasgow unanimously adopted, on Monday, a proposition for erecting a new bridge across the Kelvin at Great Western-road, at an estimated cost of £30,000.

The Putney burial board have accepted the tender of Mr. A. Lucas, at £6,830, for the drainage, laying out, and fencing of their new cemetery about to be formed at Kingston Vale, from plans by Mr. J. C. Radford, C.E.

A mission-house has just been built in River-street, Ayr, in connection with Darlington-place United Presbyterian Church. The cost was about £1,400. The architect, Mr. Jardine, died a few weeks before its completion.

Trade News.

WAGES MOVEMENT.

EDINBURGH JOINERS.—The Committee of Joiners of Edinburgh held a meeting on Friday night, when it was reported that three out of the four employers who had notified a reduction had withdrawn their notice, and agreed to pay the standard wage—namely, 7d. per hour.

A new morning chapel, just added to St. Anne's Church, Manchester, was dedicated by the Bishop of the diocese on Friday.

At Sheffield on Tuesday the lessee of the Alexandra Theatre was granted a renewal of his license on condition that he provided a fireproof curtain, made all doors to open outwards and hang in two parts, so as to be available in case of panic, and provided two independent staircases to the galleries, both fireproof.

A new Congregational Church is about to be built at Accrington from plans by Messrs. Potts, Pickup, and Dixon, of Manchester, who are also the architects of a Swedenborgian Church to be built at Failsworth.

A greatly increased Catholic population on the north side of Preston has compelled a very considerable enlargement of the Church of the English Martyrs—a comparatively new edifice of stone. Dean Pyke placed the matter in the hands of the architects of the church, Messrs. Pugin and Pugin, of London, who have extended the body of the church about 80ft., and have added two transepts, each 28ft. by 18ft., giving a total additional accommodation of about 400 sittings. A choir-room, sacristies, strong-room, a room for heating apparatus, and two confessionals have also been built.

At Shrewsbury, J. Gethin, a builder, was summoned for having erected a number of houses at Greenfields, the drainage of which was not carried out as he had been required to do it according to the plans sanctioned by the sanitary committee. It was alleged that the original plan showed a fall of 1ft. in a hundred in the new drain, but this was not approved, 1ft. in 50 being ordered. The drain was made, however, according to the original plan. Mr. Gethin did not deny this fact, but said it was the result of a mistake, and now that the houses were built and let he did not see how he could alter it. He was fined £4, altogether, and costs, and ordered to pay 4s. per day till there was an alteration made to the satisfaction of the borough surveyor.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

Holloway's Ointment.—Sores, wounds, ulcerations, and other diseases affecting the skin, are capable of speedy amendment by this cooling and healing Ointment, which has called forth the loudest praise from persons who had suffered for years from bad legs, abscesses, and chronic ulcers, after every hope of cure had long passed away.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

Mattock Bros.—	4,371 0 0	4,177 0 0	577 0 0

A.—Building. B.—Amount if glazed bricks and iron sashes are omitted. C.—Fittings.

LONDON, W.—For the erection of a block of stables and residential flats, John's-place, West Kensington. Messrs. Lewen-Sharp and Arpin, 3, Duke-street, Adelphi, W.C., architects. Quantities by Messrs. M. Evans and Son, 7, John-street, Adelphi, W.C.:—

Belham and Co.	£7,135 9 4
Patrick and Son	6,925 0 0
Scrivener and Co.	6,838 0 0
Grover and Son	6,742 0 0
Peto Bros.	6,597 0 0
Leslie and Knight	6,570 0 0
Colls and Sons	6,320 0 0
Boyce, T.	6,250 0 0
Patman and Fotheringham, Theobalds-road, W.C. (accepted) ...	6,100 0 0

LONDON.—For alterations to No. 26, Chapel-street, Edgware-road, W. Mr. R. Willey, F.R.I.B.A., 66, Ludgate-hill, E.C., architect:—

Ashby Bros., City	£490 0 0
Rhodes, Hyde Park	373 0 0
Jones Bros., Ealing (accepted) ...	360 0 0

LONDON.—For alterations, additions, &c., to the Lord Belgrave p.h., Leicester-square, for Mr. W. Booker. Messrs. J. and A. E. Bull, architects and surveyors:—

Bywaters	£2,250 0 0
Patman and Fotheringham ...	2,120 0 0
Stevens...	2,055 0 0
Oldrey and Co.	1,994 0 5
Williams	1,957 0 0
Gould and Brand	1,797 0 0

NEW BARNET.—For erecting a bridge over Pymmes Brook, for the East Barnet Valley Local Board. Mr. F. J. Rumble, C.E., engineer:—

Brown and Sweetland	£522 0 0
Bell, G.	459 0 0
Pavey, W.	415 0 0
Dearle, W. H.	395 0 0
Lissamon	387 0 0
Jarvis, E., Banbury (accepted) ...	339 0 0

(Surveyor's estimate £420.)

OXFORD.—For the erection of a covered swimming bath at St. Edward's School, Oxford. Mr. W. Hanson, Oxford, architect. Quantities supplied:—

Symm and Co.	£1,497 0 0
Wilkins and Sons	1,332 0 0
Honour, J.	1,315 0 4
Wyatt and Son	1,268 5 10
Kingerlee, T. H. (accepted) ...	1,174 0 8

(Architect's estimate £1,250.) All of Oxford.

PAIGNTON.—For the erection of a confectioner's shop and dwelling-house on the Gerston Estate, Paignton, for Mr. H. Ching. Mr. S. Woodbridge, jun., 210, High-street, Brentford, architect:—

Bridgman, M., Paignton	£610 0 0
Rabbich, H. (accepted)	593 10 0

PIMLICO.—For alterations and additions to Nos. 77, 79, and 81, Cadogan-place, for Major-General Keith Fraser. Messrs. Godwin and Basley, architects. Quantities by Mr. I. Mason:—

	No. 77.	No. 79.	No. 81.	Total.
Lott and Co.—	£1,653	£1,710	£1,705	£5,068
Taylor and Co.—	1,270	1,256	1,253	3,778
Holliday and Greenwood—	1,159	1,227	1,222	3,608
Oldrey and Co.—	1,150	1,215	1,215	3,580
Stimpson and Co.—	1,080	1,240	1,240	3,560
Holloway—	1,120	1,112	1,108	3,340
Garlick—	1,050	1,085	1,085	3,220

RHYL, N. WALES.—For alterations and additions to Old Town Hall premises, for Mr. T. Smith. Mr. J. Adams, Warrington, architect:—

Foulkes, T., and Son, Colwyn Bay...	£525 0 0
Miller, L., Mostyn	464 18 0
Jones, A., Rhyl...	450 12 0
Forkington, A. W., Rhyl	399 12 0

(Architect's estimate £437.)

SANDIACRE.—For making, metalling, curbing, sewering, and paving new streets, on the Springfield Estate, Sandiacre, Derbyshire, for Mr. T. Hooley, J.P. Mr. J. Sheldon, Long Eaton, Derbyshire, surveyor. Quantities by the surveyor:—

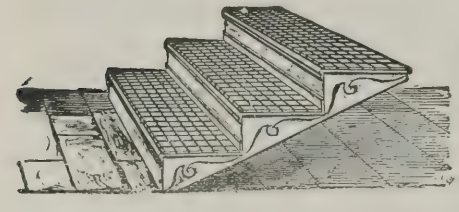
Malabar, Exminster...	£4,680 14 2
Turner and Son, Bilston	4,575 0 0
Cordon, Burton Joyce	4,373 12 0
Green, Rotherham	4,323 0 0
Cordon, Newark	4,197 10 0
Holmes, Alfreton	4,150 0 0
Smith and Lunn, Newark	3,700 0 0
Todd, Derby	3,528 12 4
Bradley, Lincoln	3,390 10 0
Raynor, Nottingham	3,311 4 9
Hawley, Ilkeston	3,240 0 0
Beardsley and Pounder, Ilkeston...	3,000 0 0
Exclusive of boating filling up stuff:—	
Wheatley and Maule, Nottingham*	3,082 0 0

(Surveyors' estimate £3,744.)
* Accepted.

SHADWELL.—For sundry alterations and additions to the Kent and Essex Wharf, Lower Shadwell. Mr. C. Dunch, architect:—

Curtis and Son	£722 0 0
Hunt, J. R.	652 0 0
Morter, J.	620 0 0
Harris and Wardrop	600 0 0
Greenwood, J. and J.	598 0 0
Shurmur, W.	594 0 0

SOUTHEND.—For the works required in erection and completion of barracks buildings, Clarence-street, Southend, for the Salvation Army. Mr. E. J. Sherwood, 101, Queen Victoria-street, E.C., architect. Quantities by the architect:—



Scharien and Co., Chelsea	£1,538 0 0
Watson, W., Ilford	1,515 0 0
Baker and Wiseman, Southend ...	1,429 0 0
Munday, J., Wimbledon	1,420 0 0
Darke, S., and Son, Southend ...	1,380 0 0
Woodhams, F. E., Southend ...	1,360 0 0
Newton and Idle, Clapham Common	1,349 0 0
Steward, J. W., Southend	1,330 0 0
Stephenson, G., Bishopgate-street	1,324 0 0
Tout, W., Hendon	1,310 0 0
Multon and Wallis, Gravesend ...	1,248 0 0
Jarvis, E., Banbury...	1,185 0 0
Coxhead, F. J., Leytonstone ...	1,040 0 0

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1718.
FRIDAY, DECEMBER 9, 1887.

UNPRACTICAL ARCHITECTS.

HOW many times in the course of the erection of a building the architect's notion of what something ought to be clashes with that of the builder! The finishings of a room or the details of a window or some other feature fall very short of the expectations of the designer, though from a purely practical point of view they are satisfactory, and fairly carry out the specification. The same thing has been looked at differently. The architect has imagined a certain result, or has drawn largely on his fancy; but the builder has gone steadily to work, looking at the possible means of economising material or labour, and with only a very bare or mechanical idea of the work. The result is disappointing, though there is not sufficient ground to require the work to be improved or amended. And this want of a proper interpretation of the architect's design is often owing to several causes. The drawings or details may not be explicit enough, or clear in their intention; the specification is ambiguous or not properly descriptive; the right thing has not been specified, or the technical knowledge or artistic sense of the workman is at fault. Now, it is very certain that the only way to eliminate all these factors of error, is to not only design, but execute with one's own hands. Of course this is impossible, and the nearest course to adopt is to try and educate the workman up to the ideas of the architect, to get him to understand why this or that is done—why this moulding or curve is preferred to another; and, in short, to make him a proficient in the interpretation of drawings. Nothing of the sort is ever attempted. We have heard builders tell their workmen, when they have questioned and proposed an improvement, not to trouble themselves about it; and one eminent architect used to say to his workmen, and even his own assistants, "You are not to think, but only to work." If the thinking is to be only done by the architect, the workman at once becomes a mere tool, a machinist, and the gulf between the thought and the work is widened. But a proficient in the interpretation of the architect's design the workman can never be, unless he is taught something more than to handle his tools, and sees a chance of being promoted for skill. In France the working mechanic is brought more into contact with the architect; the same hands are employed to carry out the architect's designs, the consequence of which is in course of time the workmen understand the architect's style, and begin to take a personal interest in their work, knowing that attention and skill will bring their reward. All this is knocked on the head by contract work. There is no association of handicrafts and artists; but each is striving in his own way to underbid the other. Under the contract rule, it is not politic to understand too well or to examine too closely the architect's design: men who can execute quickly rather than those who can suggest and improve, are they who get on and commend themselves to the contractor. Is it strange, therefore, that the work turned out is below the standard of the architect?

The absence of agreement between the architect's and the builder's notions is not altogether traceable to the want of not being able to interpret the ideas and methods of the architect: in part it proceeds from the failure of the latter to descend to the practical. The architect is unable to look at things in the same light, to understand the working conditions, or the methods adopted by the trades in converting materials or in execution. A drawing is given, we will say, for a roof or some piece of construction, in which the dimensions or the scantlings are not dictated by a practical knowledge of the market thicknesses of timber in use, and strict compliance with the architect's details would entail an addition to the cost of material and labour. In his priced tenders the builder has assumed that he can use any convenient scantlings, but the architect requires that his dimensions are worked to without abatement. Here is a hypothetical case. A builder takes a contract to build a church in which there are tie-beams across the nave. As he chances to have some baulks of timber of about the right length and depth, which cut into two lengthwise would be within a couple of inches of the required size, he puts a reduced price down, and obtains the contract. The architect's drawing of roof to a large scale with the dimensions figured thereon is sent in due course to the builder; but the builder proceeds to frame his own timbers together for the trusses, and the principals are made so much narrower to agree with the tie-beams. The trusses look thin and flimsy to the architect, who measures and finds they are narrower than specified. Explanation is of no avail. The architect is firm in his demands, and the timber trusses made are thrown upon the contractor's hands, of no use to anyone. It is needless to say the loss to him is serious. For all purposes of strength the scantlings are probably ample; but they do not suit the architect's ideas. Many church architects affect scantlings like those found in old churches, square in section: it is wasteful of timber; but then it looks better, and that is sufficient. The short of the matter is, economical conversion of materials does not enter into the architect's creed. Even in such matters as thickness of doors, the rule is to describe them of a certain thickness, which the contractor naturally thinks to mean "less sawing." Architects who understand this practical detail describe the work to be of such dimensions, "finished sizes." Mistakes are constantly being made about mouldings to framed work. The builder, of course, naturally thinks machine-made mouldings are good enough; but the architect all the time expects them to be according to detail, and "on solid." In stonework the same disagreement as to details and finish is common, if the architect is particular: many of course are not—any finishings will do for them. It is immaterial, argues the contractor, how a stone cornice is built up of small blocks if it economises stone, and in every kind of architectural masonry the architect's method of working and the builder's may be vastly different. In solidity and substantiality the architect's mode of working may be better than the builder's; but, as economy is the chief consideration with the latter, the point is to convert the materials to the greatest advantage, and with this object the architect ought to be prepared, by a practical acquaintance with the trades, to make the best compromise. Very much turns on the specification. The builder's interpretation of it is very unlike that of the architect. The quantities, taken from the latter document and by a surveyor who is practical first, suffer by the translation, and are considerably at variance with the spirit of the design—no doubt, a strong reason why architects should know something about quantity-taking and billing, and exercise some discretion in amending and correcting items which are often diametrically opposed to their ideas.

To write a good specification has not been one of the things which the modern architect has troubled himself about. The trades have been left to experts. Take plumbing, smith's work, hot-water supply, the decorator. Because these trades are sublet, the architect thinks it superfluous to describe the works in detail—the tradesmen themselves prefer it. All the greater reason, we should say, why the architect should be able to discriminate between good and bad work, and be able to select fittings and details that shall be in accord with the design and intention of the work. The profession have a better chance now than ever they had in becoming acquainted with new materials and manufactured articles for building. Trade advertisements and circulars draw attention to hundreds of improvements in construction, sanitation, and decoration. What is wanted now is for the architect, the artificer, and manufacturer to exchange their views by some kind of recognition of the merits of materials and goods on one hand, and of art principles on the other. An art-architect may say he has no time to study details; but it seems to be the only way in which his ideas can be diffused amongst workmen and manufacturers, and the greatest of modern architects have been men who have entered intently into the various trades and details of buildings. Did not the fine Gothic taste of the elder Pugin enter into every variety of fabric and manufactured article—woodwork, brasswork, glass, textiles, and paperhangings, for all of which he prepared designs? Awkward differences and conflicts between architects and the working artist can only be overcome when the details are more mastered, when the practical conversion of materials is understood, and an attempt is made to bridge over the gulf which now separates the two.

A RECENT DECISION AS TO RIGHT OF LIGHT.

A PRINCIPLE laid down by the late Sir G. Jessell in "Allen v. Taylor," to the effect "that where a man grants a house in which there are windows neither he nor anybody claiming under him can stop up the windows or destroy the lights," was sought to be applied the other day by a Banking Company at Birmingham against the erection of buildings demised by the Corporation of Birmingham to the defendant (Ross). From the report of the case in the Chancery Division, it appears that some years ago the Corporation demised to the predecessors in title of the plaintiffs a house overlooking Warwick-passage, 20ft. in width, on to land occupied by low buildings since pulled down. Later, the Corporation let to the defendant this land for the purpose of erecting buildings considerably higher. The light to the plaintiffs' premises was materially affected by the defendant's new lofty building, which reached 80ft. in height. Thereupon the plaintiffs claimed a mandatory injunction or damages against the defendant on the rule of law we have cited above.

In giving judgment, Mr. Justice Kekewich alluded to the decision of Sir G. Jessel. It was not competent to the Corporation to erect these new buildings which obstructed the plaintiffs' light; nor could it be asserted that the defendant had any better title than the corporation, his grantor, to do so. From this point of view, his Lordship said that the defendant is liable to pull down his new buildings to such an extent as to avoid obstruction, or to make compensation in damages. Before enforcing this liability, the Judge said it was necessary to investigate the circumstances under which it arises, and be careful that the rule of law is not stretched beyond its just limits. The facts of this case constituted, he thought, an exception to the rule. The learned Judge referred to several cases. The counsel for defendant, Mr. Barber, Q.C., said that the rule had never been applied, and could not be to any case in which the obstructing building stand

on land severed from the site of that containing the windows which are obstructed; but this argument was overruled, and several cases were quoted bearing on the subject.

Referring to the limitations and exceptions of Sir G. Jessel's rule, his Lordship took another view, which ought to have some weight. The case of "Rigby v. Bennett" offers such a limit as that which the merits of the case required. His Lordship said in connection with that case there was one point which was reserved, and he quoted Lord Justice Cotton's remarks as follows:—"It is not necessary, in my opinion, to consider what would be the consequence if the grantee knew that the grantor intended to use the adjoining land for a particular purpose, and the right claimed by the grantee is consistent with that purpose. That question may hereafter arise, and I give no opinion upon it." This question, Mr. Justice Kekewich said, had arisen here. Mr. Daniell, under whom the plaintiffs claim, must have known that the Corporation had acquired land for the purpose of constructing a new thoroughfare, and that this could only be done by selling or letting the land for building purposes; he must have known, his Lordship continued, what class of buildings were likely to be erected in a broad street, and that they would be lofty. With such ground rents as were demanded by the Corporation, the building must necessarily be high in order to be profitable, and, although Mr. Daniell did not apprehend this at the date of his lease or agreement for a lease, he might reasonably have done so. His Lordship said the difference between 48ft. and 80ft., the heights of the respective buildings, though large when considered with reference to the actual obstruction of light, was not large in comparison with neighbouring houses in such a locality. In conclusion, he said: "Compelled, as I think I am, to decide, not by laying down any general rule, but only with reference to the particular case, the question left open by 'Rigby v. Bennett,' I hold that the grantee of the plaintiffs' house knew that the grantor intended to use the land on the other side of Warwick-passage for the particular purpose of building houses of business, and that what has been in fact erected thereon is not in excess of what he must be taken to have expected and assented to be erected. I therefore give judgment for the defendant, and he is entitled to his costs of action."

The decision is of sufficient importance to justify calling attention to it. That there is no rule without its exception has been very forcibly made clear in this action. Few were ready to dispute the dictum laid down by Sir George Jessel under any circumstances, and the rule itself is a sound one; but there was a reservation hinted at in Lord Justice Cotton's judgment which Mr. Justice Kekewich has practically enforced. There is an apparent hardship, too, inflicted on the owners of a building which had been erected several years ago, when the light which they had enjoyed for a long time has been materially reduced by a later building at the opposite corner, and allowed to be erected by the Corporation, who had demised the premises. They had, in fact, set aside the rule in granting to their lessee, Mr. Ross, powers which interfered with the rights of light of an earlier lessee. On the other hand, the original grantee was supposed to have estimated probabilities. There was, as the Judge said, a strong probability that larger premises would one day be built on the other side, and this assumed knowledge the successor in the title is supposed to have known. A lessee, under such circumstances, cannot complain if what he might have foreseen and calculated upon has actually taken place. The principle of this argument is quite sound and reasonable; but we cannot avoid thinking that in this instance the new building is somewhat in excess of what the original lessee could have anticipated. A building 80ft. in height would materially obstruct the light of a building only 48ft. high, and divided by a narrow passage; it, therefore, would appear to be reasonable that some limitation in height should have been imposed by the Corporation in respect of the more recent building. The law cannot take cognisance of these limits, it can only apply a general principle; it follows that it is the duty of local authorities to prevent, as far as possible, these admitted grievances and invasions of the rights of old lessees.

ROYAL SOCIETY OF PAINTERS IN WATER COLOURS.

THE reputation of this old society is maintained by the present Winter Exhibition at the Gallery, 5A, Pall Mall East. The gallery opens with contributions by well-known hands. Sir Oswald W. Brierly, marine painter to the Queen, sends three or four pictures of marine subjects, which for drawing, pure colour, and breadth of effect are not surpassed. We are charmed with the simplicity and conscientious work in "Study of an Old Boat," stranded on a beach (2); the freshness and atmosphere and breadth of "Sky Study at Gorleston"; the colour and aërial effect in "A Grey Morning at Venice" (178). William Collingwood's "Chillon's Snow-White Battlement" (1), and his "Rest" (165), an old ivy-covered church with low tower, surrounded by tombs, are pleasing reminiscences enshrined in Classic verse; but there are other contributions which show this master has not lost his masterly touch and power of fascinating colour. Edward F. Brewtnall also sends a number of studies of more or less interest. "The Uttermost Parts of the Sea" (5) describe the inspiration of the artist in this sketch of a deserted coast with its crippled tree, weird in its solitariness. Mr. Brewtnall is a dexterous manipulator of the brush, as we see in this and his study of head (262). Passing a "Bowl of Roses," by Miss Maud Naftel, and S. P. Jackson's "St. Agnes, Cornwall" (7), but not without perception of their merits, we come to Norman Tayler's "A Windy Day," a sketch of a shepherd and flock crossing a common, admirable in its pure colour and freshness. Two other pastoral subjects (26 and 95) are hung. E. A. Waterlow, in his "Cottage Home" (17), has done one of the best things on this wall. There is delightful simplicity of subject and pathetic power in this little rural sketch of a cottage with an old woman driving her geese home, the sunset peeping through the trees. The colour, as usual, is blotted in with broad effect. "Summer Weeds" (57), and a small study on a screen (348), "A Connemara Wood Nymph," are also full of true feeling. Birket Foster, so well known to all lovers of water-colours, is less strong this time, though his "Autumn Leaves" (18), and his other rural studies on walls and screens, such as a charming little piece, "A Farm" (344), and "Cottage at Sidmouth" (159), exhibit the same loyalty to the old school of finished water colour, of which Mr. Foster is a distinguished member. Widely different schools of manipulators have since appeared, making the minute rendering and leafiness, and if we may term "dottiness" of this master's style somewhat monotonous. Quite Turneresque are H. Clarence Whaite's "Loch Ranza, Arran" (24), "View of Snowdon" (98), and "Mountain Gorge" (25). The "scumbled" and "sponge" effects of sky and mist are skilfully managed, and the effect of light and colour thereby obtained. Similar "sponged" or granulated effects are seen in Colin Bent Phillips's fine picture of "A Summer Day in Skye." The sweep of mountain hollow and the distant hills are well blended in hazy light. A study of sunlight (4) and other views from the Isle of Syke, by the same hand (138, 263), exhibit this technical method. A. W. Hunt is an artist of luminous colour. His "Robin Hood's Bay" (35), seen through the mist of a showery evening, and in the afternoon (163), are delightful examples of delicate colour and mist. Truly poetic are Mr. Hunt's studies of "Whitby Harbour" (85, 127), noonday and evening effects, and his small sketch on screen, "Whitby—Moonlight." The mist is wonderfully manipulated. Cuthbert Rigby's views in Derbyshire (34) and his "Calder Abbey," with its glow of reddish light (289), to say nothing of other works, are not wanting in those graces of drawing and colour which have won this painter a reputation. So we must praise R. Thorne Waite's work; his fresh meadows at "Arundel" (38), his "Kingsley Vale in Sussex" (28), his broad, sunlit landscape, "Chichester Harbour, from the Downs" (91), and his haymaking studies (311), all of which exhibit true qualities of painting, and conscientious regard to nature. Albert Goodwin this year is almost impressionist in colour in his "Pass of the Brünig" (40), his "Lucerne, Evening," "The Gate of Zoar" (198), and his very pleasing studies of Bath, Worcester, Wells, and Bristol (330, 335, 340, 347) on the screens. The sunlight effect and delicate handling are remarkable, and the sketches of the cities we have named are charmingly decisive and sharp in drawing, and luminous in tone. Henry Moore, A.R.A., sends a few sketches from the Isle of Wight. "A Sunny Afternoon" and "Freshwater Bay" (307) are vividly drawn in strong colours. A very clever study is Thos. J. Watson's "Mangolds" (46). His "Sandbank, Surrey" (90), in a prominent part of gallery, is faithfully rendered, with admirable colour. A "Wheatfield" (206), "Abode of the White Owl" (207), are both drawings exhibiting fertility of resource and technical power. H. Stacy Marks, R.A., is a skilled delineator of character. "A French Novel" (47), an elderly priest, with cigar in his hand, reading, and "Mind and Muscle," a village smith and cleric talking at a workshop door, are inimitable studies of expression. The character expressed in the features of the brawny and sinewy smith, and the intellectual cast of countenance of the old man, with large book under his arm, are unmistakable. The "Secretary" (183), and the clever studies of physiognomy, "Tasting" (190) and "Seeing" (199), are as true in the delineation of character as they are technically good. Mr. William Callow still sketches the streets of foreign cities with marvellous freedom and poetic grace of colour. His "Street in Bologna" (48), "Market Place, Ratisbon" (92), "Stonegate, York" (156), "Venice" (236), and the fine view of the apse and chapels of St. Pierre, Caen, Normandy (240), are something a great deal more than mere drawings; the light and shadow and grouping are perfect. George Fripp sends several studies of interest, and Alfred D. Fripp two delicately-handled subjects full of sunlight (105) and soft colour (170). No less than eight works are sent by Miss Clara Montalba, whose pencil is still as subtle and fascinating as ever. "On the Amstel, Amsterdam" (52), a row of brick houses beside the river, has depth and tone; "Towed Out of Ramsgate Harbour" (134) is full of sweet harmony; delightful in their mellow pearly tints are another sketch from Amsterdam (237), and some other Dutch and Venetian studies. "Fowey" (531) and "Entrance to Harbour," by Herbert Marshall, are equally good. Wilmot Pilsbury has a dozen studies of more or less merit. The "Margin of the Stream" (17), delicate in handling and colour, is one of the best examples. A sunny coast scene by Francis Powell may be mentioned; and Edward Radford, in "Two Flats" (63), has a clever

study of figures and costume of the period of the "Directoire," in which two high-waisted young ladies are listening in a listless mood to a professor at the pianoforte. At the corner of gallery Robert M. Allan has a forcibly-painted picture of "The Queen's Jubilee"—the procession passing Whitehall. Works by Matthew Hale (81) display the technical merits of the artist. We may also notice the series of Scenes from the Highlands (82) by T. M. Richardson, and another from Switzerland (103), all of interest; the sea expanse and soft light in S. P. Jackson's study (89) of Tennysonian verse. Other of his sketches on the Cornish Coast (189) and the Thames (200) show a diligent student of the sea and river. What appears to be an allegory or symbolical study of colour is Henry Wallis's "Flute Player" (94), whose other picture, "Herodotus at the Scribes'" (13), is a street scene in some Eastern city with the old historian engaged in looking at a manuscript, in both of which the colouring is strong. But figure-subjects are few. Arthur H. Marsh has a clever study of a group of fisher-people on a beach, in which there is freshness and colour; not very strong in motive is C. Robertson's "Lawn Tennis," the chief merit of which is the flower border and the execution. Several other studies by this artist are sent. Studies by H. Gillard Glindoni (16); a frame of six small sketches by G. Walter Field (121), Samuel J. Hodson's view in Verona (137), E. B. Johnson's "Pensez-a-Moi," Charles Davidson's "Derwentwater" (153), are other works. Sir John Gilbert, R.A., contributes two works, "Rocks at Tunbridge Wells" (162), and a "Back Lane," equally bold and freely-handled woodland subjects, displaying all Sir John's wonted vigour and depth of colour. H. P. Riviere, Paul Naftel, Carl Haag, Jessop Hardwick, George Fripp, Edward J. Poynter, R.A., send sketches. Our notice would be hardly perfect without reference to the fine series of drawings and sketches by the late Collingwood Smith, which occupy a large space on the walls. Some of these are remarkable for clearness and depth of tone, and represent Italian scenery and other Continental and English landscape subjects.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting for the present session was held on Monday evening, the president, Mr. Edward I'Anson, in the chair. In referring to the death of Mr. Edmund Woodthorpe, the PRESIDENT remarked that a more cheery, true, and honourable man never existed in the profession than their late friend. Professor Kerr, in endorsing this tribute of respect to Mr. Woodthorpe's memory, suggested that the Institute might perhaps send a memorial to the Metropolitan Board of Works supporting the claims of his son to the favourable consideration of the Board in disposing of the appropriations held by their late colleague, a large portion of whose income probably depended on this source.

It was announced that at the recent examination in architecture 25 candidates presented themselves, of whom 19 passed; 25 candidates also satisfied the examiners in March last, making a total of 44 who had passed during the year. From among these 44 gentlemen the Ashpitel prize had been awarded to Mr. Thomas Dawson, aged 23, late of Scarborough, and now of Kennington, S.E., he being the candidate who had in the opinion of the examiners most highly distinguished himself in the examination of the current year.

Mr. RALPH NEVILL, F.S.A., read a paper on

THE AUDITORIUM OF A THEATRE.

The author, having dealt with the typical plan of a theatre and the arrangement of seats, remarked that in England, within the last few years, various efforts had been made to meet modern requirements. The drawings which he was able to exhibit by the kindness of Mr. Phipps, Mr. Verity, and Mr. Darbishire, would confirm that statement. Mr. Irving's suggested plan was bad, for the people at the back could only see the lower half of the stage; but it was the only alternative to the usual gallery arrangement. The system of seating recently adopted, by which the dress circle and stalls have been brought in close proximity, at the Haymarket was the best artistically, and the proportions allotted to the various parts of the audience were commercially most satisfactory; the system was also economical in first cost, and in proportion of cubical space to accommodation. The pit, which should be as large as possible, would, with good accommodation, always prove a financial success. The stalls should be only slightly curved, having no central passage, and the seats should be regularly alternated, so as to afford a clear view between the heads of those in front. The visible openings of boxes should not be more than 5ft. or 6ft. high. The gallery should be at the back, and not in the circle. It was important, artistically, as well as for acoustic reasons, that the ceiling of the auditorium should be as low as possible. Referring next to the question of acoustics, Mr. Nevill argued that the circular form of building afforded no advantage, the best being a triangle with the stage at the apex, as in the theatre at Baireuth, although seats arranged on a curved plan allowed a greater number to receive unimpeded waves of sound. In a plan by the author, three-quarters of the diameter was taken for the height from the stage level to the springing of the ceiling; this was lower than most modern theatres, the height of which, apparently, measured as much as the diameter. The lesser height was, however, an artistic and economical, as well as acoustic, gain. Flat ceilings rendered the hearing in the upper part defective; if curved, the sound was collected and delivered in a body on to the upper circle. Ventilation and fire risk were also connected with the ceiling: the introduction of the sun-light rendered it more easy to ventilate through the centre of the roof, and some suggested a cupola, as in Terry's Theatre, and Mr. Irving's proposal; but this he considered impracticable and undesirable. The more still the atmosphere the better for sound, and hence the advantage of the electric light, particularly for foot-lights, was enormous. Proposals had been made for reversing the draught by ventilating through the stage, but most architects would agree with Prof. Roger Smith that all draught should be from the actor to the audience. Prof. Smith quoted, in his treatise on acoustics, some experiments to the effect that though sound travelled better with the wind than against, yet it travelled better still across the wind. If this were true, and the author believed it was, one great objection to the central ventilating flue disappeared. Saunders, Prof. Smith, Mr. Salomons, and nearly all English theatrical architects upheld wood, while Lachez, followed by some of the French architects, demanded solid construction. A house for music required an amount of resonance, while in one for acting sound should be delivered pure and distinct. Wood was, therefore, as bad for the latter as stone or hard walls for other reasons. Plaster was a very suitable substance, supplemented by drapery where necessary. Wood might be a suitable lining to solid walls if carefully selected, put together like cabinet work, in short lengths, and well oiled and varnished; but floor boards nailed to wooden joists, or match boards papered or painted, had no beauty of tone, and the consequent vibration interfered with the purity of the sound. In Terry's Theatre no wood was used in this way, but, instead, concrete floors and partitions of plaster on wire netting and iron uprights. The ceiling should be treated as a resonant surface, constructed of iron and plaster, with a second roof over inclosing a sufficient hollow. The spaces under the floor and orchestra should also be hollow. Any resonant substance used should be of homogeneous character. Lighting ought to be regarded by the manager as a potent means of inspiriting an audience. It might be accepted that the electric light would be used, but nevertheless provision must be made for gas. To be successful artistically the lights must be various, both of kind and colour. In the event of fire the electric light would be extinguished by the breaking of the glasses; the gas sun-light ought, therefore, never to be put out, but turned low during the performance, and turned up full between the acts; the electric light being turned quite out in the first case, so that the eye was entirely drawn to the stage. The front of the circles was the natural place for electric lights. Putting them high up in the cupola and using ground-glass globes for electric light was to be strongly condemned; the latter, though much used, destroyed the brilliancy of the light. The lights to the passage and on the stairs should be on a separate system altogether from that of the auditorium or the stage; and should be controlled from the front of the house. To protect against rushes of carbonic gas extinguishing the light, at certain points, such as the entrance to stairs and opposite doors, small flues and openings with thick glass fronts should be provided in the walls for lamps or gas-lights. As to ventilation, the electric light rendered no great provision of fresh air necessary during a performance. It would, however, be always requisite to provide an exit for impure air; and as long as gas was used behind the scenes, there must be sufficient ventilation to take away the enormous and dangerous heat at the top, without creating a draught to the stage. The sun-burner ought to be in a little cone or drum of its own, and have an outer ring to the shaft, which should be opened by the same action that turned up the light, in order that ventilation might be accelerated between the acts. Necessarily the site largely governed both exits and entrances, and the important point was to get plenty of doors leading out of the auditorium. Any part accommodating more than 200 persons should have more than the usual two doors. The pit, holding 350, in a plan of his own, possessed four doors and an extra one in the middle. All doors should have the upper panels glazed, should open outwards, and be self-closing, so that when the audience were out the doors would be closed to fire. No better mode for puzzling an audience could be suggested than the one recently advocated of furnishing everyone present with a plan of the exits. No more dangerous arrangement could be concocted than a long straight staircase. The straight exit from Terry's Theatre had been made a great deal of in the public Press; but, having passed down it, he would rather take his chance anywhere in the passages of a burning theatre than be one of a crowd going down it. No flight of stairs should be long without at least a small landing that might afford opportunity to resist pressure from behind. The best form of landing-stair was undoubtedly such as that to the gallery at the Prince of Wales's Theatre, in which four flights of four steps each went round a centre. The rounding off of the corners was a great improvement. The great *desideratum* in a staircase was that a crowd could pass from top to bottom without any great pressure at any point and in a continuous stream. A circular staircase would best attain this, the difficulty of the difference in the width of tread being overcome by using an ellipse for the plan in which the steps were set to a very large radius, and the small ends used as landings. There was another form of the ellipse still more easy, and often applicable to a theatre—that was by forming the ellipse round a triangle. The Metropolitan Board of Works required that every staircase should be solidly closed in on both sides. The author ventured to say that regulation was a dangerous mistake. A staircase in a public building should be open at the sides from top to bottom; there should be no part from which the passengers were unable to see what took place all the way down, and, especially, to see the way out. Mr. Nevill considered it would be of the greatest advantage if all the staircases could be concentrated in one building, and be under one general control and supervision. A design of such a staircase, on the triangular plan, was exhibited: each flight rose 8ft. 6in., the height of the floors. A separate staircase started from each corner—one to the pit circle, one to the upper circle, and one to the gallery. The central space was left open, and the whole building carried up a good height to allow smoke or gas to escape upward. Iron foot-rests should be built into the stair on the inside, up which firemen could climb if required. At the present moment fire-risk was the point of most interest in connection with theatres, and after deprecating more than a certain degree of

legislation and State interference, the author expressed his belief that in London, in a well-regulated theatre, fire-risks were of the slightest. The only particular danger in a theatre, above other places, was the reckless use of gas behind the scenes and the extreme combustibility of the woodwork over the stage. Electric light and fireproof paints, together with the careful use of iron and concrete in the structure generally, would minimise the danger. Some form of fireproof curtain must be obtained, and sufficient of the top of the stage should open to form a chimney. It was an advantage to substitute iron in the seats where feasible, to avoid a blaze as much as possible. The seats should be cut off by a fire-resisting partition or wall from the corridors. The opening in the top of the stage should not be too large, and the same action which opened it should open a valve at the bottom for inlet of air. Referring to the fireproof curtain, Mr. Nevill mentioned several, such as hydraulic curtains of two thicknesses of iron, solid oak or teak, asbestos, Mr. Max Clarke's silicated cotton curtain and the water curtains of Capt. Heath and M. Marius, the latter being regarded as the better arrangement. A very useful addition to a theatre would be a separate door and small iron stair in a fireproof shaft for firemen to enter from the outside.

Mr. Walter Emden said his own training had been practical rather than theoretical. There was so much pure assertion, utterly opposed to the practice of theatre architects, in Mr. Nevill's long paper that it seemed almost impossible to discuss it. With regard to the position of the pit, no manager at the present day could afford to give the best place to this portion of the house; but there was no doubt that to place the pit a long way back, as in Mr. Irving's suggestion, was unadvisable, for the pittites would be able neither to see nor hear, and would be liable to be suffocated. The English plan of theatre arrangement was, he believed, the best, or at least the one most suited to our habits and requirements. So far as acoustics were concerned, iron and concrete were equally as good as wood, and were far preferable constructionally. There was no doubt that plaster on wire would be excellent walling from an acoustic point of view; but Mr. Nevill was mistaken in supposing this was adopted at Terry's Theatre; there the partitions were constructed in hollow firebrick, which was capable of sustaining great weights with a minimum of thickness, and afforded greater protection in case of fire. As to elliptical staircases, people would continually stumble on them, because they expected the treads to follow in a circle and not an ellipse. He formerly had an office approached by an elliptical staircase, and had frequent complaints of this character from clients. It was a question whether a straight or square staircase was the best form; but the elliptical plan was a source of danger. The lecturer had made a mistake, also, in his treatment of the question of lighting. According to the regulations of the Lord Chamberlain and of some county magistrates, the gas for lighting the auditorium must pass through a separate meter controlled from the front of the house. Although it had long been quite practicable to render a theatre constructionally fireproof, up to the present time, until Terry's Theatre was built, no building of the kind was erected on fireproof principles, much of the internal construction and the tiers of the galleries were nearly always constructed of wood. The difficulty and danger of fire were always, however, from the stage, and not from the auditorium. The iron curtain that had been proposed by Mr. Nevill would buckle in case of fire, and from its immense weight would tend to pull down the proscenium itself. What was wanted was a means of saving, not the building, but the audience, by giving time to escape. An ordinary asbestos curtain, woven in double thickness, would withstand fire for at least ten minutes or a quarter of an hour, and if provided along the top with a line of sprinklers, worked by valves, could be kept perfectly cool and intact till the proscenium itself was consumed. These sprinklers should never be automatic, but controlled by an attendant by valves; they supplied comparatively little water, but that was sufficient to check a fire at an incipient stage. For this purpose sprinklers were most useful; but their value ought not to be exaggerated.

Mr. Alfred Darbyshire, of Manchester, having spoken, Professor Kerr proposed the adjournment of the discussion. This motion was seconded by Mr. Robert Walker, who remarked that much of what they had heard was very startling. As district surveyor during the past twelve years for a portion of the Metropolis containing about 50 per cent. of its theatres, he had had considerable practical experience in the matter, and he must protest in the most emphatic manner against the lecturer's assumption that the question of safety was a commercial matter between the public and the managers. It was one for legislation of the most stringent character. As professional men it was their business, and indeed their solemn duty, to see that the public were exposed to a minimum of danger. Indeed, if they did not do this, he warned them that others would be employed who would take all precautions.

On the motion of Messrs. E. J. Tarver and O. Hansard, a vote of thanks was accorded Mr. Nevill, and the President announced that the discussion would be adjourned until Monday, Feb. 6th. At the next meeting, to be held that day fortnight, a paper would be read by Mr. F. R. Farrow, entitled "The Recent Development of Vienna."

ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting for the 41st session of the Association was held on Friday evening, the President, Mr. John Slater, B.A., in the chair. It was announced that Mr. T. G. Jackson, M.A., F.S.A., had selected as the subject of his paper to be read at their next meeting: "The proposal to make architecture a close profession by imposing the test of examination and registration." On that evening, Friday, the 16th inst., the President would announce the date fixed for the convening of a special meeting to consider and define Rule 22, relating to the composition of the committee.

PERSPECTIVE DRAWING AND APPARENT FORM.

Mr. Frank T. Baggallay read a paper on "Linear Perspective and the Apparent Form of Objects," illustrating his remarks by numerous black-board diagrams. The author said that his interest in the subject was awakened by a paper read before that Association on November 24th, 1876, by Mr. Augustus Frere, on "Binocular Perspective and Natural Vision," in which it was shown that an ordinary perspective drawing represented things as if seen with one eye only. Although Mr. Frere went on to lay down rules for providing pictures of what is seen with two eyes, Mr. Baggallay believed that it is not only practically but theoretically impossible to represent on a flat surface or to a small scale even the crudest outline of a solid object as seen with two eyes—a fact recognised and commented on by Leonardo da Vinci in his well-known book. For the sake of convenience and simplicity, it may be said that the eye sees each point of an object by means of a ray of light proceeding in a straight line from that point to the retina of the eye. One eye, therefore, is enough to tell us the direction in which a point lies, but it is not able to tell us how far off that point is. If it were nearer, or more distant, the image brought by the straight ray of light would still be upon the same spot of the retina, and except for a slight difference of distinctness would be exactly the same image, so far as the brain was cognisant. It follows from this inability of our eyes, taken singly, to measure the distance of points from themselves that one eye cannot tell us the form of an object. If, for instance, we look with one eye at the angle of a cube, we cannot see that the three receding sides are square, although experience tells us that squares are more common than lozenge forms; but the second eye sees the angle from another view-point, and corrects and completes the first impression. The science of linear perspective is based on this inability of one eye to detect distance. It assumes that a man is using but one eye, and that, as he cannot tell where the points that make up the outline of the object looked at are situated on the several rays that bring the images to his brain, we may deceive him, and place those points anywhere on the rays that we choose. We generally prefer to draw, not on a spherical surface with the eye as a centre, which would theoretically be the best possible arrangement, but on a plane surface, and, therefore, we imagine the points so situated that they would all be on a plane surface. All our rules are merely directed to find where each ray from each point would cut that plane surface. Drawings made in this way, with accuracy, are scientifically correct representations of what we should see with one eye from a certain spot—that where all the rays intersect. The difficulty of providing for the different aspect given by both eyes could only be overcome by making two perspectives from very slightly differing view-points, and then uniting them in an instrument on the principle of a stereoscope. Passing on to consider the vanishing of vertical lines, Mr. Baggallay remarked that without doubt as we look at them we see all lines vanishing, vertical ones disappearing both upwards and downwards, and also the ends of all horizontal lines—*i.e.*, those which are parallel to the plane of the picture. This is because the apparent length of a line is measured by the size of the visual angle. A perspective drawing may be equally well made on any surface, mechanical facilities for execution being neglected. Thus circular panoramas are drawn on cylindrical surfaces in order to allow of bringing a more extended view into the picture without apparent distortions. In setting out a plan for a perspective on a cylindrical surface, the picture plane must be the same as that of the surface drawn on, and in setting the heights they must always be set up vertically, finishing, of course, on the picture plane. The lines of such a drawing are a conical projection of the lines of the object on the surface, and they will not be straight lines when projected on curved surfaces. Leaving theory, and turning to practical matters, the question presents itself: Can we make any alterations in the science of perspective, as it is now understood and practised, that will be improvements in the sense of enabling us to represent by any scientific process more exactly what we see? No advance had been made since Dr. Brooke Taylor enumerated the rules of plane perspective in 1715, and Mr. Baggallay firmly believes that no improvement is possible. The limitations of our science of perspective seem sufficiently serious when stated in words. It only enables us to draw what we see with one eye stationed at one particular point, and, still worse, the picture, to be seen correctly, must also be looked at with one eye stationed at one particular point. In practice these are not such serious matters, for our eyes are not very ready to discover small inaccuracies, and imagination and memory come to their aid to correct many of the errors that the trained eye would otherwise detect. Still, it is worth consideration whether or no these defects can be overcome. Binocular perspective must be dismissed from consideration as impracticable. It is impossible to insure that our perspectives shall be viewed as intended by one eye and from a particular standpoint. It is, however, a legitimate question whether by sacrificing absolute correctness as regards one point of view we could not get more nearly correct (or at least, less wrong) as regards all other points from which the picture may be viewed. This could be done, but Mr. Baggallay thinks at an expenditure of time and labour very much greater than the advantage gained. All that is necessary is to treat our drawing on flat paper as a development of the drawing we should get on a spherical surface. We must use, in that case, a circular picture plane in the plan, and circular height lines of various diameters, according to the points at which they cut the sphere; very nearly all the lines that are straight in the real object will, of course, become developments of circular arcs—*i.e.*, elliptical; the labour, therefore, of making such a drawing would be colossal, and in the end we shall only have gained a slightly greater approach to correctness when the picture is looked from wrong points of view, and that by giving up actual correctness when looked at from the right point. The rules of perspective are, in fact, so perfect that, if only means could be found to make people look at a drawing from the right point of view, no distortion would be apparent, however much the picture were extended. The usual rule is

that a picture must be confined within a visual angle of sixty degrees, the reason being that this is all the eye can conveniently grasp at once, and we should also draw as much at least as will be contained in a visual angle of 45°, to induce people to look at it from far enough off. An important condition of success in making a perspective is to so arrange it that people will naturally look at it from about the right point of view. The picture plane should always be arranged somewhere about from 18in. to 2ft. distant from the station point in plan, because that is the most convenient distance for looking at a drawing that is neither very delicate nor very large or coarse. The point of sight should always be absolutely opposite the centre of the picture in plan. The lecturer added : I always commence setting out a perspective in this way : Taking the plan, I choose a station point at the spot from which I judge the building will look best or be most seen. I then make up my mind how much of the object I want to get into my picture, and draw lines from the extremities to the station point ; then I find the visual centre by bisecting the angle. I then measure the angle, and if it is less than 45°, or more than 60°, I shift the point a little nearer to, or further from, the object—always along the central ray. When all this is settled, it is time enough to think about the picture plane. As far as the view of the object is concerned, this may be anywhere and at any angle, it will not affect the view at all ; but, in order to get people to look at the picture from about the right point, I draw the plane at from 18in. to 24in. from the station point, as nearly as the required size of the future picture will allow, and always absolutely at right angles to the central visual ray. Adverting to the vanishing of lines, Mr. Baggallay said that, as Mr. Burchett had pointed out, it is unnecessary to draw lines parallel to the picture plane as vanishing because the appearances of representations of things are subject to the same optical laws as the appearances of the objects themselves—*i.e.*, if two lines in an object which are really straight and parallel appear to vanish, then the representations of those lines on a sheet of paper will only appear to vanish in the same way if they also are really straight and parallel.

A short discussion followed, in which Messrs W. H. Atkin Berry, F. R. Farrow, H. O. Creswell, W. H. Pratt, and A. O. Collard took part, and a vote of thanks was accorded to Mr. Baggallay for his paper.

HOUSE IN SUNDRIDGE PARK, BROMLEY, KENT.

THIS house, which is in course of erection from the designs of Mr. Evelyn Hellicar, of Bromley, is situated on high ground, there being extensive views on the north, east, and west sides. The external walls are faced with red bricks from Dorking, Surrey, the roof being covered with Yorkshire tiles of a red colour. Mr. G. H. Lay, of Bromley, is the builder, the estimated cost being about £2,200.

ARCHITECTURAL DRAWING.*

MR. PHENE SPIERS'S reputation as a water-colour artist, coupled with his experience as master of the Architectural School of the Royal Academy, are a sufficiently adequate guarantee that any book from his pen on this most interesting subject would comprise much practical and useful information. His volume is nicely illustrated by typical examples of draughtmanship, including familiar specimens from the offices of Messrs. J. L. Pearson, R.A., R. Norman Shaw, R.A., Alfred Waterhouse, R.A., and the late F. P. Cockerell, who was a most accomplished artist. Mr. Ernest George is represented, as also are the late Thomas Allom, Mr. Spiers himself, and the late Geo. Edmund Street, R.A. It will thus be seen that a great variety of style and method is marshalled before the beginner, for Mr. Spiers, forsaking apparently in despair the ideal of his earlier days, when, fresh from the schools of Paris, he sought to enforce the French system of soft graduated tintings and geometric shadow projection upon his Conduit-street friends, sinks all individuality in his eminently eclectic handbook, and so leaves the student unaided in the task of making a choice as to which master he may with most profit follow, or which style of delineation he may with the best personal advantage adopt. Like the proverbial cat in the legend, the pupil's difficulty at starting is the necessity of beginning somewhere. The multiplicity of facts thus placed before him tend to confuse his judgment, and consequently, that which should have been most helpful to him is likely to prove quite otherwise. This is to be regretted, because Mr. Spiers clearly knows what he is talking about, and is familiar enough with his subject from its many and diverse points of view. Unfortunately, it is this very knowledge which seems to rob his book of any definite teaching power for the use of those who really want the information and guidance which this book was intended to supply. Its failure seems to be akin to that of which so many students from the Royal Academy schools complain, owing to the conspicuous want there of some distinct system and leading generalship. At present the pupil is confused by the varied suggestions and, what often seem to him, somewhat contradictory ideas of the distinguished visitors who in turn attend the classes, neither of whom can know what his predecessor has said nor what his criticism upon the student's previous work has been. Both in the conduct of the classes of Burlington House and in Mr. Spiers's book on architectural drawing, there manifestly is no lack of knowledge ; indeed, each is as clever as need be ; but there is nothing in either which can be accurately described as masterly or systematically complete. Gifted students, by an intuitive power of their own, may, no doubt, easily discriminate and make full use of the advantages so placed before them, while, owing to their own skill, such aspirants to fame readily enough develop into favourite pupils, and thus secure special attention ; but with the rank and file it is far otherwise, mainly because of the absolute want which we have here briefly indicated. The classification adopted, by which Mr. Spiers divides his subject into three broad divisions, is : 1, student's work ; 2, office work ; 3, out-door work. This may be a convenient arrangement, because it avoids difficult questions and leaves undecided leading points connected with architectural education ; but surely such a teacher as the author should settle, at least in a general way, for the benefit of his youthful reader, some line of action, instead of telling him that "such questions as we now leave undecided will eventually, it is to be hoped, by common consent and custom, be settled one way or the other to the advantage of the principal and pupil, the profession and the public." The pupil

* Architectural Drawing. By R. PHENE SPIERS, F.S.A. London : Cassell and Company.

naturally may exclaim, "What am I to do in the mean time to learn my business and my art to the best advantage"? This is what the learner wants to know—not that doctors do not agree, nor how they differ; but why so distinguished a master as Mr. So-and-so does this, that, and the other, the last being clearly the outcome of the first. Odd specimens of good men's work compiled side by side without any such reference clearly do not meet his needs, and the more brilliant the examples are the less likely are they to do so. Mr. Spiers furnishes some good instructions about drawing paper, instruments, and materials. Then follows an introductory chapter on elementary projection and copying, with brief references to outline freehand and drawing from the round in such schools as the Royal Architectural Museum, Westminster, the Museum at South Kensington, and the Schools of Art throughout England, the author remarking that more than often the best freehand draughtsmen are found among students from the country. Backlining is rightly condemned, though it must be admitted that what Burges called the "Flick and Dot" style, still fashionable in some leading architects' work, is equally misleading, especially when for the effect of "high light" half the lines in parts are left out entirely, or only partially put in. As to the "contouring process" or "mass lining," advocated on page 18, it is eminently childish and deceptive. An architectural drawing is a technical diagram in which every line has a precise fact to record and information to give; any trickery, "contouring" or otherwise, is a mistake, and students especially ought to be unhesitatingly warned against it. We do not like the specimen of French colouring for the same reason, which serves as a frontispiece. The general appearance no doubt is effective; but it is unquestionably unreal, and as to the projected shadows giving you the depth of the various faces, the idea is out of the question as regards the main features. For example, the shadow on the S.W. tower, thrown from the western portals, does not terminate till it passes the vertical angle of the tower, and so, as a record for measurement, is lost entirely. As for the apsidal projections at the sides of building, they might be anywhere longitudinally for aught the drawing tells us. The chapter on perspective includes some questionable remarks about spherical and cylindrical delineation; but furnishes very sparse information as to setting out drawings, rectangular or otherwise. The centrolinead is, however, both illustrated and described; so likewise is the "Perspectograph," a complicated invention by Mr. Ritter, of Frankfort-on-Maine, supposed to be capable of mechanically drawing perspectives. Some time since we offered to try this instrument, and went to an exhibition where it was on view to do so. The agent met us; but neither he nor we could make it work. This, it was said, was due to the instrument having been tampered with. Another machine was therefore sent to our office, with the same result. The agent came to explain; but he, too, was unable to make the Perspectograph do its work, and said that parts of the instrument had been sent wrongly. He took it away, promising to send another; but no more was heard of the matter. Mr. Spiers does not say whether he has used one or not; but he prints the manufacturer's description and his illustration advertisement. Either the machine is a good one, or it is not, and the student should be properly advised one way or the other with regard to it.

Some practical working drawings of buildings, which have before been illustrated, are here given in colour to show the methods adopted in some offices for showing the several materials employed; but as the lithographers were unable to follow exactly the precise tints, the colours are not quite as correct as might be wished. Mr. Rowland Plumbe's warehouse drawing is a capital one, and the plan of Mr. Alfred Waterhouse's own house ("B.N.," Jan. 7, 1881) is a good specimen; the details, however, to a larger scale on this sheet would have been more useful had they illustrated part of the building shown by the general elevation. The words "Half-inch scale detail" inscribed on the top of these plates, when the drawings scale less than a quarter, is an oversight which needs correction. The most interesting parts of the volume before us are the plates reproduced after the example of the many autograph drawings which we have published in our own pages and elsewhere of well-known architects' work, while some of them have already appeared in the BUILDING NEWS, as, for instance, Mr. Norman Shaw's house at Harrow Weald, for Mr. Goodall, R.A., called "Græme's Dyke" ("B.N.," Sept. 6, 1872), one of his most successful Artists' Homes. Neale's St. Alban's Abbey is laid under contribution; Crowland Abbey, by F. P. Cockerell; Lincoln Cathedral ("B.N.," Nov. 26, 1887), by W. H. Bidlake; and some good French sketches by Gerald Horsley. Thomas Allom's design for the Liverpool Exchange is one of the best plates in the book, and the chromo-lithographs from Mr. Cockerell's thorough studies are admirably rendered. The publishers have indeed spared neither pains nor expense in the production of the volume; but we cannot say it is likely to take rank as a permanent textbook.

REQUIREMENTS OF THEATRES.

THE observations made by Mr. Adler at the recent Convention of Architects at Chicago about the requirements of large theatres were in general sound, and his requirements are such as are now generally admitted to be desirable. With regard to site, theatre promoters have very little choice in the matter. A site is vacant, or may be obtained on reasonable terms at the corner of two streets, or in some rearward position, and a theatre is erected, of course complying as nearly as possible with the regulations of the Metropolitan Board of Works. Mr. Adler says in "no case should a site be chosen which does not permit the disengagement of the building on at least three sides." This condition is practically impossible in large towns, and would very materially restrict the erection of theatres in London; perhaps, on the whole, for the public benefit. So much is a question of financial concern, that even the determining the space to be assigned to the stage is a vital point. There must be "a reasonable proportion between the cost of producing a good opera or theatrical performance, and the size of the audience which can be drawn to see the same." In America it is found difficult to maintain a *corps de ballet* or a company large enough to fill a stage approximating that of a European house of the first rank.

Alluding to illumination of stage and auditorium during performances, the author considers the incandescent electric light the only desirable means; shadows, of course, should be avoided in distributing the lights of the stage, and reflectors are useful to throw the light where it is required. On the important question of ingress and egress, Mr. Adler says no allowance less than three feet for every two hundred persons in determining the width of passages, doors, and stairways should be allowed. The corridors and lobbies should be large enough collectively to hold more than half the audience. Other suggestions are that the passages and corridors should lead direct to the doors, and be narrow and numerous rather than few and wide. We do not see any suggestion as to the form of stairs, which formed a subject of discussion at the Royal Institute of British Architects on Monday night—whether the rectangular or dog-legged staircase or one of elliptical shape is the safest. We should be inclined to think the former is the best form, if all the angles are rounded. Mr. Adler says the air must be warmed in winter and cooled in summer, a sufficient quantity being forced into the house and removed by mechanical means. For acoustic reasons the air currents should tend from the stage outwards; for this end he thinks one-third of the air ducts should open on the stage, but be under control of the prompter when smoke is produced on the stage.

Amongst the provisions against fire the author suggests a very large and high smoke-duct above the stage—with a valve that can be controlled by the prompter—for the escape of smoke; automatic sprinklers, hand-pumps, grenades, &c. To promote good acoustic properties, the adoption of Scott Russell's isacoustic curve to the seats is desirable. A low proscenium, and not an excessively wide opening, is recommended for the same reason. Wide side galleries are objectionable. Many of these suggestions are excellent, and have been before advocated; but the difficulty is to introduce improvements in structure and arrangement where commercial considerations are so strong, and theatrical views of arrangement have to be consulted. Managers and lessees of theatres are generally found averse to all changes and new arrangements. They will not tolerate the abolition of galleries, and steadfastly oppose the increase in the number of entrances and exits. Of course, every additional entrance entails the cost of door-keepers or ticket collectors—matters which concern the pockets of the lessees. In brief, the public safety and interests clash so much with those of proprietors, that it is very hard for architects to get their way entirely.

NEW FORMULA FOR THE FLOW OF WATER.

AT a meeting of the Society of Engineers, held at Westminster Town Hall, on Monday evening, Professsor Henry Robinson, president, in the chair, a paper was read on "A New Formula for the Flow of Water in Pipes and Open Channels," by Mr. Edgar C. Thrupp. The author said that, having worked out, by means of graphic diagrams, a formula for the flow of water in pipes, based on a large number of experiments by M. Darcy and others, with some by himself, he was induced to try, this year, how far experiments on the flow of water in open channels (such as those by Darcy and Bazin, and by Major Cunningham) would be amenable to the same mode of treatment. The results were not only satisfactory, but unexpectedly threw light upon some points in the question of the flow in pipes, which had before been difficult to explain. He had thus been enabled to obtain a general formula, applicable both to pipes and open channels, and taking into account the effects on velocity of the varying relations between hydraulic depth and roughness of surface, in a manner that had not hitherto been done. After describing the experiments of Professor Osborne Reynolds, which brought out the curious fact of a "critical velocity" at which eddies come in, for a limited range of velocities, after which an even flow again takes place, the author described the apparatus he had himself used, and showed the graphic results of experiments, which he had also reduced to tabular forms. He then gave Reynolds' formula, and Hagen's, of which latter his own was a modification, the changes introduced having for their object to express the effects of various degrees and kinds of roughness in the surfaces flowed over, with varying hydraulic depths. Hagen's formula, as proposed to be modified, is :—

$$v = \frac{R \quad x + y\sqrt{z - R}}{\sqrt[n]{c}\sqrt{S}}$$

In this formula the constants are—for wrought iron pipes, $n = 1{\cdot}80$, $c = 0{\cdot}004787$, $x = {\cdot}65$, $y = {\cdot}018$, and $z = {\cdot}07$. For riveted sheet iron pipes, $n = 1{\cdot}825$, $c = 0{\cdot}005674$, and $x = 0{\cdot}677$. For an open channel of pure cement, semi-circular (4·1ft. diam.), $n = 1{\cdot}74$, $c = 0{\cdot}004$, and $x = 0{\cdot}67$. For an open channel of pure cement of rectangular form (5·94ft. wide), $n = 195$, $c = 0{\cdot}006429$, and $x = 0{\cdot}61$; and for open channels of "earth, no vegetation," &c., $n = 2{\cdot}00$, $c = 0{\cdot}015356$, and $x = 0{\cdot}72$. Mr. Thrupp concluded by justifying the effort to make a more accurate formula, by comparing the results of experiments with the results obtained by calculation.

MASONRY AND STONE-CUTTING.*

By LAWRENCE HARVEY.

THIRD LESSON.—PROBLEM.

To construct a semicircular Archway in Stone, penetrating into a semicircular concrete Vault; the outside Face of the Wall being on the Batter, and not Parallel on Plan to the inside Face.

WE have selected this peculiar arrangement in order to handle the problems of stone-cutting in their general bearings with every difficulty which may occur; the usual dispositions of walling being but special, although simpler, constructions. At all events,

* All rights reserved.

such a structure as the one proposed might occur in forming an opening through a river-wall into a tunnel placed under the roadway.

The reader will observe that we have in this structure only to cut voussoirs with a plane face at one end and a cylindrical one at the other, and that we have *not* to connect these voussoirs with others, as would have been the case if the vault had been constructed of stone instead of concrete.

The perspective view, or, rather, axonometric projection (Fig. 14), may help the reader in getting a clearer idea of our structure. The semicircular vault of section G X D″ is carried on one side by a wall, the interior face D″ *d*″ of which is vertical, whereas the exterior face D′ *d*′ is on the batter; and, as stated, the outside ground-line *d*′ *c*′ of this wall is not parallel to the inside line *d*″ *c*″. The axis of the archway is perpendicular to the interior face of the wall; its section is semicircular, as shown in A Z B, and its springing line, A B, is on the same level as the springing line of the vault.

It is evident that the outline of the archway on the outside face of the wall will be an ellipsis, for it is the intersection of a cylinder by a plane not perpendicular to its axis. On the other hand, the intersection of the archway with the vault will be a line of double curvature, as shown by dotted line A″ Z″ B″ (Fig. 14).

(Fig. 15.) In making the working drawings for cutting the stone voussoirs, we leave out the walls that support the vault, and take our plan at the level of the springing line common to both vault and penetrating archway. We select for our elevation a plane perpendicular to the axis of the archway, and thereon draw the semicircular archway and its voussoirs as if we had to deal with any ordinary archway. On plan the arrises of the bed-joints will be parallel to the axis of the archway, and we have only to find out the points where they are terminated either by the exterior face of the wall or by the surface of the vault.

We shall describe only the process of drawing one voussoir—say, the one projected vertically on the pentagon M N P Q R, as the operations carried out for this voussoir have but to be repeated for the other voussoirs to get all the stones which form the archway. The voussoir being a prism contained entirely between the face of the wall and the surface of the vault, to delineate it completely we have only to find the intersection of its sides with the face of the wall and the intrados of the vault.

To get the intersection with the wall face, we produce through a point C two sections of the wall, the one by a vertical plane on trace C′ E′, the other by another vertical plane on trace C′ F′ (see plan); the one is perpendicular to the wall face, the other is parallel to the axis of the archway. The first section on C′ E′ is given by the batter of the wall, and we can at once draw it in C E on the left side of the elevation. The second section on C′ F′ can be deduced from the first, for we know that E′ F′ parallel to the wall face is the plan of a horizontal line E F. If Z on the elevation shows the height of the horizontal line E F, we will be able to mark the points E and F, through which each section of the wall face will pass.

Thanks to this preliminary operation, we shall be able to draw the intersection of the voussoir by the wall face. Take, for instance, the arris of the voussoir projected vertically in M and horizontally on the line G *a*′ M′. To get the point M′ we cut the wall by a vertical plane, of which G *a*′ M′ is the trace. This section will be a straight line, forming, with a vertical line produced in *a*′, an angle equal to the angle Z C F, and, therefore, we can conclude that the distance I K produced on the elevation at the level of M will be equal to *a*′ M′ on plan. Such is the simple operation by which we readily find not only the angles of the voussoir on the wall face, but any number of intermediary points by which we can delineate the curved portions thereof.

If we repeat this operation for all the voussoirs, we shall have drawn on plan the horizontal projection of the head of the archway with the curves of intersection of the intrados and extrados. These curves are portions of ellipses of which we have conjugate diameters, the one the trace A′ B′ of the wall, the other the axis of the archway itself; this allows us to draw also these curves direct without reference to the elevation. (For the delineation of ellipses, of which two conjugate diameters are given, see "Burchett's Practical Geometry," Problem 117.)

To determine the horizontal projection of the other end of the voussoir, the one which forms part of the surface of the vaults we draw on the right-hand side of the elevation the section D U X of the vault; the distance T U taken at the level of the arriss M will give us the distance *a*″ M″ on the plan. We can by this method get the intersections of the arrises of all the voussoirs, and by joining these points of intersection we get on plan the curves of penetration in the vault by the intrados and the extrados of the archway. It is useful to know, although it can only be proved by algebraical calculation, that these curves on plan are hyperbola, the axes of which are the axes of the intersecting cylindrical vaults.

It is evident that the planes of the bedjoints of the archways cut the vault according to elliptical curves. These may be drawn with the help of intermediary lines taken on the surface of the bedjoints between the arrises; but considerable help is obtained in drawing these curves by the knowledge that their prolongations must all pass through the point O″ on plan. As shown in our drawing, the axes of these ellipses are easy to find, which allows of delineating the curves mechanically with the help of a trammel.

(Fig. 15.) *Tangents.*—Curves of large dimensions are more easily drawn with the help of a few points and tangents to the curve, than by getting a great number of points without the assistance of tangents; for this reason we show how tangents to the various curves which occur in masonry are to be found.

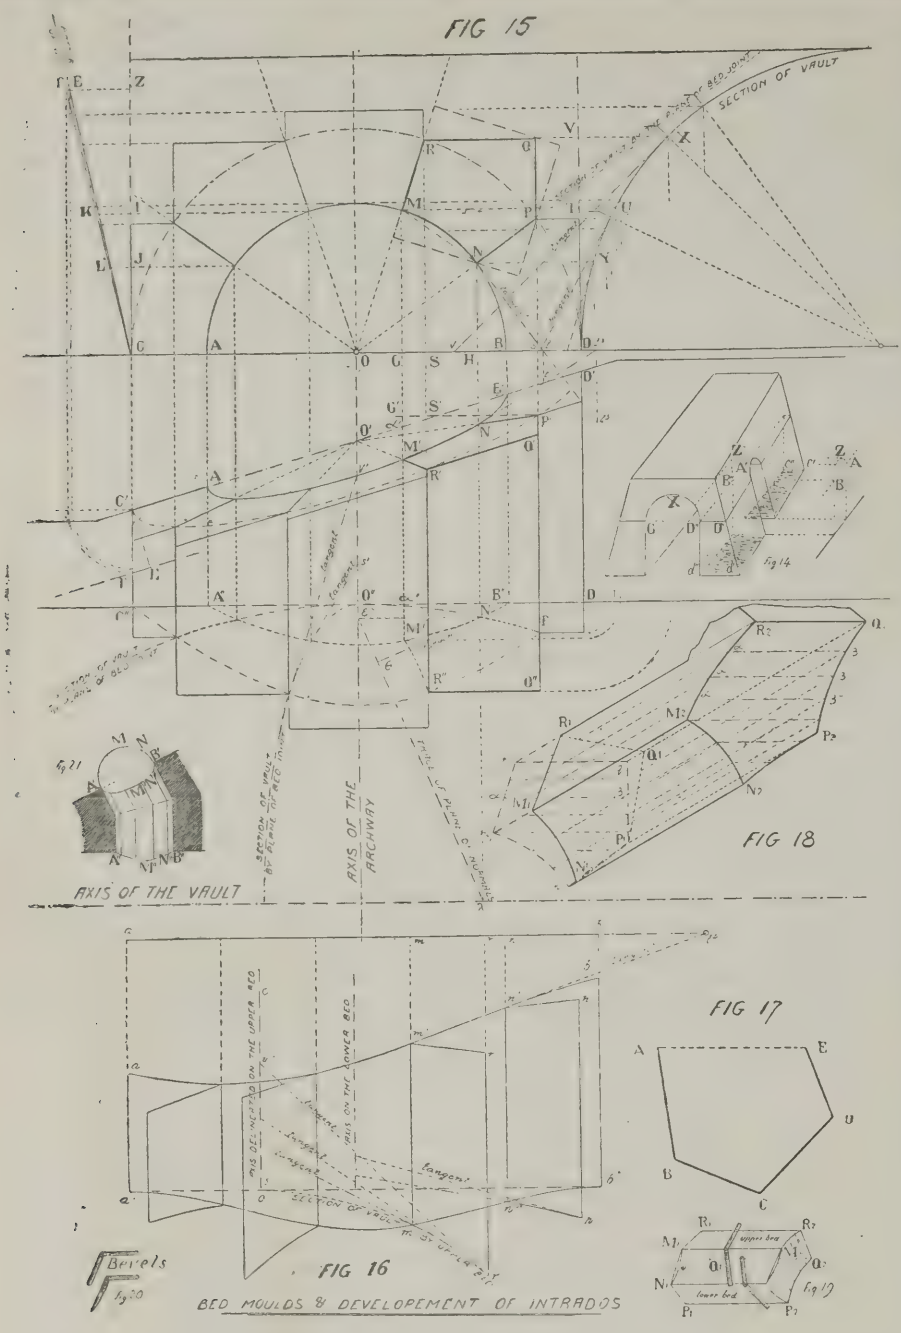
For the curve of the archway on the exterior face of the wall, tangents to any point, such as N′, are readily obtained. The vertical projection N *t* of such a tangent is tangent to the elevation of the archway, and it cuts the trace A′ B′ in the same point *t*′ as the plan of the tangent, which is therefore N′ *t*′.

A similar method can be used for finding tangents to the elliptical curves formed by the intersection of the vault and the bed-joints. If we consider the section of the vault as an auxiliary elevation, the tangents to the vault in the points U and X are elevations of the tangents to the curve of intersection of the bed-joint M R in the points M″ and R″. The tangents being contained in the plane of the bed-joint will, of course, meet the axis of the arch, and if we make O″ *s*′ = D*s* and O″ *v*′ = D*v*, we shall get the points *s*′ and *v*′ through which the tangents pass.

The tangents in points of the curve of intersection of the arch and vault can be found in the ordinary way as the intersections of the planes tangent to both cylinders, the arch and the vault. If the tangent in the point N″ were required, we might produce the tangent to the point Y on the section of the vault, and the point where it would cut the ground-line A D would give us the distance from D where the trace of the plane tangent to the vault would pass. The same operation, carried out for the point N itself on the archway, would give us the trace of the plane tangent to the intrados of the arch. The intersection of these two traces would, of course, be a point of the tangent required, and the point N″ would be another. But this operation is inapplicable to the starting points A″ and B″ of the curve, for in these the two tangent planes are vertical, and their intersection on plan is all projected in one point. Besides this deficiency, the former operation is longer than the following, which is applicable to all points alike.

The rapid method of finding tangents is based on the fact *that the plan of a tangent to a curve of intersection is perpendicular to the trace of the plane which contains the normals in the same point to both the intersecting surfaces.* The normal to the surface of the archway in the point N″ is projected on plan in N″ ε, of which ε is the foot on the ground plan taken at the level of the springing line. Likewise the normal to the vault is on plan N″λ, of which λ is the foot; therefore, the line ε λ is the trace of the plane of the normals. We can now produce the plan of the tangent, N″θ perpendicular to ε λ, which is all we require to guide us in drawing the curve.

(Fig. 16.) *Moulds.*—Having drawn all the voussoirs of the archway in projection on plan and elevation, we have now to get the exact outline of the faces of each voussoir, so as to be able to cut out in cardboard the moulds we require for working the stones.



The soffits of the voussoirs can be easily developed, for they form part of a cylinder, the intrados of the arch. In Fig. 16 we have made the straight line *a b* equal to the circumference of the arch, and we have shown by the points *m* and *n* the portion thereof which belongs to the voussoir we intend to cut out. We draw on the development the direction of the arrises M and N and as many other generators of the cylinder as we may require; then carrying the distances *m m*′ = G M′, *n n*′ = H N′, &c., we got the development *a*′*m*′*n*′*b*′ of the head curve of the arch. By a similar operation we get also the development *a*″*m*″*n*″*b*″ of the curve of penetration into the vault. The development of the soffit of the voussoir considered is, therefore, comprised within the quadrilateral figure *m*′*m*″*n*″*n*′.

To get tangents required for drawing these curves of the developed cylinder, use the usual methods of descriptive geometry, remembering that the positions of elevation and plan are here reversed—t^3 is the trace on the plane of our elevation of tangent N*t*, and Nt^3 is the length which we have to carry from *n* to t^4 so as to get $n't^4$, the tangent required. The same operation applies to finding the tangents of the other curve. Simplifications are also obtained by taking the ground line at different levels to get the traces not too distant from the drawing.

To get the moulds of the bed-joints, we turn down the planes of the joints round the arrises of the voussoirs such as M. The upper arris will then occupy the position *r r*″, in which the distance *r r*′ is equal to the distance S R′ of Fig. 15. The arris *m*′ *r*′ is a straight line; but the arris *m*″ *r*″ is a part of an ellipsis, and to draw it, a few intermediary points are required, found by the same method by which the points *m*″ *r*″ were found. A simplification is obtained if we delineate on the turned-down plane of the bed-joint the axis O O″ of the arch; then we know that the curve *m*″ *r*″ prolonged will pass through O O″, and that the tangents to the curve will cut the turned down axis in the same points *s*″ and *v*″ as on the plan.

Operations for Cutting the Voussoirs.—The voussoirs can be cut by two different methods: in the one *squares* only are used, in the other *bevels*. In the first method we begin by forming a parallelopiped, of which the pentagon (Fig. 15) M N P Q R is the base, after which we cut off the portions of the parallelopiped which lie outside the finished voussoir. This is by far the safest method of stone-cutting; on the other hand, it is the more costly, as it involves working surfaces of operation which have to be destroyed afterwards, and, in some cases, it involves a great loss of material. In the second method, the surfaces of the stone are worked successively by means of bevels equal to the angles formed by the arrises of the stone. In this method of operating, every mistake made entails further mistakes, and we should say that absolute accuracy is rendered thereby impossible. It is, in fact, a method similar to that which a draughtsman would employ if he endeavoured to copy the polygon (Fig. 17) by drawing successively the sides A B, B C, C D, and D E, measuring the angles with the aid of protractors. It is evident that, starting from A, he would have little chance of reaching E accurately! whereas by taking A E as a basis, and drawing a series of triangles, he would get the points D, C, B without difficulty, and absolutely correct. Nevertheless, on account of its cheapness, the method of bevels is invariably preferred by stonemasons.

In Fig. 18 we show the operations of stone-cutting according to the *first method*. We select a stone in the shape of a prism, the base of which is at least equal to the dotted rectangle, which surrounds the elevation of the voussoir M N P Q R (Fig. 15), and the length of which is equal to the greatest dimension of the voussoir measured on plan. Once the basis of that prism has been worked plane, a mould $m_1\ n_1\ P_1\ q_1\ r_1$ = M N P Q R (see Figs. 18 and 15) is delineated on that surface, taking care that one of the sides, such as $m_1\ r_1$, corresponding to a bed-joint, shall follow the quarry-bed of the stone. This operation accomplished,

the mason can form a prism by working the other faces of the stone with the help of a square. He will then apply the mould (Fig. 16) m' r'' r'' m'' on the surface which starts from m_1 r_1 (Fig. 18) placing the point m' in M_1 (Fig. 18) at a distance $m_1 M_1 = G' M'$ (Figs. 18 and 15) and $r_1 R_1 = R' S'$ (Figs. 18 and 15); thus he will draw on the stone the real outline $R_1 M_1 M_2 R_2$ of the bed-joint. The workman will delineate likewise the other bed-joint on the surface which starts from the arris $P_1 n_1$.

As to the soffit of the voussoir, it is a portion of a cylinder which can be worked with the help of a square, or with the help of templets, such as those shown in Fig. 12. On that cylindrical surface the workman will apply a flexible mould, cut according to $m'n'n''m''$ (Fig. 16), and thereby he will be able to delineate on the stone the curves M_1N_1, M_2N_2 (Fig. 18).

The upper horizontal joint, and the vertical joint of the voussoir, are simple planes. The mould for the horizontal one is found on plan (Fig. 15) as $R'R''Q''Q'$, which we place in $R_1R_2Q_2Q_1$ (Fig. 18). On the face of the vertical joint we have only to join Q_1 and P_1 to get the arris at one end; whereas, at the other end, which is the one where the voussoir forms part of the surface of the vault, a templet cut according to the curve of the vault will enable us to delineate the curve $Q_2\beta\beta'\beta''P_2$ (Fig. 18).

The surface of the vault will be cut by following horizontal generators thereof from $\beta\beta'\beta''$, &c. To get these generators we simply draw parallels to them on the basis of the prism, such as $\beta_1\alpha_1$, and then parallels to the upper arrises, as a_1a^1 (Fig. 18), which gives us the points a a' a'', &c., required to guide the workman's ruler and chisel when cutting the stone from β to a.

This operation completed, the portion of stone at the base of the prism which does not belong to the voussoir is cut off, and the voussoir is then completely dressed.

In Fig. 19 we show the method of stone-cutting with the help of bevels, such as those delineated in Fig. 20. Bevels are articulated pieces of metal or wood capable of being set at any given angle, and then used as common squares.

We begin the operation by dressing the surface of the natural bed of the stone and delineate thereon by means of a mould the outline $M_1R_1R_2M_2$ (Fig. 19) of the upper bed-joint. Through the arris M_1M_2 the workman can, by means of a bevel, dress a plane, forming with the plane of the bed-joint an angle equal to R M N (Fig. 15). This will be the operation plane from which the soffit of the voussoir will have to be cut out. Starting from this operation plane, and with the help of the bevel already used, we get the plane of the lower bed-joint. After marking on these surfaces the contour of the moulds, the surface of the head of the voussoir on the outside wall face can be cut, for it is given by the arrises M_1R_1 and N_1P_1 (Fig. 19). On that surface the workman will delineate the other two arrises R_1Q_1 and P_1Q_1 of the head face, which can be done with the help of a pair of compasses by taking the real lengths of R Q and P Q in Fig. 15, and marking off thereby the point Q_1 on the stone. This done we can easily cut the surface of the upper horizontal joint by the help of the arrises R_1R_2 and R_1Q_1 already obtained; and likewise, by the help of the arrises P_1P_2 and P_1Q_1, the surface of the upright joint can also be obtained. The cylindrical surfaces can then be worked out as in the former method; the soffit of the voussoir, by the help of a templet $M_1\psi_1N_1$, giving the curve of the archway; the end of the voussoir forming part of the vault by means of generators parallel to the arris R_2Q_2.

Sharp acute arrises are to be avoided, and, therefore, we must leave a ledge of 3in. above the upper arris of the voussoir where it intersects the vault. On the exterior of the wall the vertical arris is also sharp, and it will be advisable to leave there also some thickness of stone to form a joint of about 3in., perpendicular to the face of the wall; but in this case it is less important, as this joint will not be subjected to any pressure. The left-hand side of the archway and jamb in A will also present an acute angle, which one might cut off after the work was up. But this will hardly be necessary, as our construction would only be adopted in practice when the wall is only slightly oblique; if the obliquity were great, the archway would have to be composed of two vaulted surfaces meeting in a groin, as in Fig. 21. This structure we shall learn to deal with when studying the groin at the meeting of two cloisters.

THE OFFICE OF CITY ARCHITECT.

THE City Court of Common Council discussed, at their meeting on the 1st inst., the proposed appointment of a new City Architect and Surveyor. Mr. Sly, the chairman of the Officers' and Clerks' Committee, first moved the conversion into a standing order of a resolution of the Court of 1879, prohibiting any person in the employment of the Corporation receiving any commission or gratuity on pain of instant dismissal. This was carried unanimously. A report was next brought up on the duties of the office of architect, stating that while the committee contemplated the employment of the City Architect in the preparation of whatever architectural designs might from time to time be required for the purposes of the Corporation, they thought it should be distinctly understood that nothing therein contained should be taken as precluding the Corporation from obtaining, as and when they might think proper, either by competition or otherwise, designs from other persons for the erection of any building or other structure which they might require to be executed. The report was adopted. Another report, recommending that the age of candidates for the office should not exceed 50 on the day of election, was, after a long discussion, rejected by 112 votes to 33. Mr. Alliston next moved the suspension of the standing order which prevented members of the Court from becoming candidates; but this was summarily rejected by 115 votes to 16. It was arranged that the election should be held at the meeting on Thursday, in next week, the 15th inst.

Lord Salisbury's sale of his Strand property proved, says a London correspondent, a very good thing for the purchasers. The marquis received £200,000 down, and the land was almost immediately afterwards resold, and fetched £240,000. Most of the leases on this portion of the Cecil estate are coming to an end, and it is expected that the changes necessitated by rebuilding will cause almost as great a revolution in the aspect of a very familiar district as Lord Cadogan has wrought in Chelsea by the extensive rebuilding which he has undertaken there.

The removal of the French Protestant Church, the Great Northern Railway parcels office, Bull and Mouth-street, and the Queen's Hotel, for the extension of the General Post Office, have revealed another section of the old Roman Wall of London. It is of concrete, interspersed with courses of thin tiles, and is 4ft. in thickness.

WAYSIDE NOTES.

IS "the architect of the future" to be a lady? Perhaps the Registrationists had better contemplate the contingency seriously. I see the Countess of Mar, in the Christmas Number of the *Queen*, pleads for the employment of lady architects on the ground that men live but a little of their time in the houses they design, and know nothing about domestic requirements. A good many villa plans I get week after week, Lady Mar, justify your fault-finding; but I fear your sweet sex is hardly likely to mend matters much. We have already not a few people in the profession whose gender is a matter of some doubt, if one may judge by the importance they attach to the mere trimmings, and the rivalry of *bonâ fide* women-architects in the arrangement of cupboards and the decoration of doors does not alarm me; but if a separate covered entrance to each house in a London street, or a window that will shut and open without the help of an athlete, is all you want, I think you can get it as matters are—always provided the ground landlord is willing in the one case, and you will pay the ironmonger in the other.

They say a Yankee of Halifax has at last solved that problem of sucking mechanics and wood-workers how to bore a square hole, and that a company is forming to bring his device on the market. It is simply an oscillating head with chisel edges and projecting lips, which cut out the corners in advance of the chisel. The balance of the machine is an almost exact counterpart of the old-style boring machine. It is asserted that it will cut a two-by-four mortise in from four to five minutes, and do it with perfect accuracy, that a carpenter cannot complete in less than half an hour. I suppose, as usual, our own wood-working machine-makers will be in the field with something like it—half a dozen years after the Yankees.

The *Stonemason* for this month (p. 108), referring to the avocation of stone-carving in England, says:—"Many of the best stone-carvers at work here are Italians, and the most expert among the English ones have studied in Italy. It would not be difficult to explain why Italians were brought over to sculpture the tombs of Henry III. and Henry VII., but at present the phenomenon of the employment of foreign stone-carvers to execute works comparatively simple may, perhaps, point to some deficiencies in our art and technical schools." Surely there is no truth in this? One of the best known English sculptors who has been intimately associated with architectural stone-carvers all his life, assures us he never knew a really good workman who was an Italian in his life. Is anyone else's experience different?

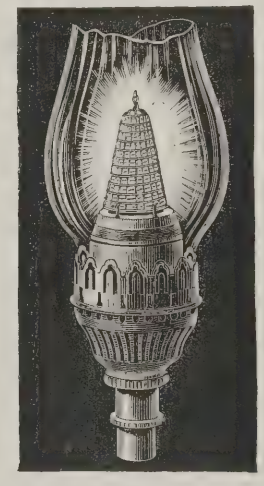
The Alexander Thomson Travelling Studentship drawings must be delivered to the Secretary of the Memorial at Glasgow before the 15th inst. It is to be hoped that there will be a good number of competitors. There is, perhaps, no style that rewards study more than that of ancient Greece, be the present fashion in design what it may; for the study of Greek detail in reality includes that of the Roman as the incomparably greater includes the less, Roman architecture being in a sense debased Grecian. Whether, therefore, the coming taste in Classic design be for Greek or Roman is a question that should not affect the direction of the student's study. Besides, Grecian architecture is the "thirteenth century" of all Classic styles, and familiarity with its refinements cannot but elevate the taste and enlarge the understanding. So it would seem best to point out in passing that all young architects who contemplate entering for the Institute examination should not hesitate as to which Pagan style to particularly get up, even if his own penchant be for the bolder forms of Roman architecture.

The smouldering fires of the "Neo-Greek" style have received fresh fuel by the action of the British School of Archæology at Athens in offering a prize of £50 to a travelling student to be chosen shortly; and Mr. I'Anson's generous contribution towards the sum to be paid to the student will also greatly help the cause. But the seeds sown in the student days of the recipient will not bring forth fruit unless he become a successful practitioner. It is not so much measuring and sketching that will advance the style, as it is *thought* and *trial*, such as led to the triumphs of Alexander Thomson himself. We may cull forms and features from plates; may obtain microscopic delineations of the gable mouldings from such works as that of Pennythorne; and Penrose's "Athens" will give us all the peculiar refinements of the old temples. But the problems before the Neo-Grecian architect are rather in the direction of general composition—of outline and massing, and the fitting of old details in positions justified by reason and sound common sense. The age is ripe for a great composition in the Neo-Grecian style; but the world will not thank the composer for a mere reproduction of temple fronts, with their orthodox columns, pediments, and enrichments.

The apostle of Neo or Anglo Greek has a weary time in this city of fog and smoke. I must modestly affirm that I have been, am, and shall most probably ever be, an admirer of those architects who endeavour to found a modern style on old Grecian principles of design. But I must also admit that I have at times many disheartening misgivings as to the prospects of such a style in our northern clime. In London, at any rate, we cannot with reason erect an edifice with that delicate work which we have been taught must accompany any attempt at the style. Here, a building completed in late autumn receives during the winter months such a layer of grimy soot that wholly destroys the effect of a set of mouldings of the delicate Grecian section. My own idea is that a very beautiful style of Trabeated architecture might be evolved without super-refined mouldings. We must cut our garment according to our cloth: we cannot expect to have our designs executed in *marble* nowadays, so our mouldings should be adapted to the materials at hand.

Alexander Thomson must certainly be considered the greatest master of the Grecian style we have seen. He, in fact, made almost a style of his own. "Thomson-Greek," shall we call it? I have had by me for some months a cutting from a Scotch paper that contains a short and rather unworkmanlike report of a lecture by Mr. Gildard to the Glasgow Architectural Association on "The Genius of Alexander Thomson." It may not be uninteresting to the reader. The report concludes as follows:—"His (Mr. Thomson's) all-embracing knowledge of Greek art is seen in the harmony of its architecture and accessories, metal-work, and decoration, &c., while of his ability as a writer some idea was given by extracts from one of his Haldane lectures. It was matter for astonishment to the lecturer that in the century of Glasgow men this distinguished architect's name found no place; one who would have been a new man among the Greeks. His reward, the consciousness of carrying out a style till it reached the splendid culmination shown in St. Vincent Church, was greater than has been vouchsafed to any other architect of Europe."

The inaugural address of the Chancellor of the Exchequer to the Royal Statistical Society was interesting to the architect of a very matter-of-fact stamp. Mr. Goschen touched upon the financial aspect of domestic architecture, and gave some statistics showing the increase in the number of houses of low rental. "From 1875 to 1880 houses between £20 and £30 increased 28 per cent.; and from 1880 to 1886 the increase was 19 per cent. There had been an increase also between 1880 and 1886 in houses between £30 and £40 of 19 per cent.; and in no class of house had there been a decrease except in those of £1,000 a year rental and upwards, which showed a decrease of 8 per cent." Depression in trade has led to the multiplying of "small property"—people being obliged to go from the unassuming house to the pretentious villa. There is much in Mr. Goschen's address that should be studied by all. A full report of it will be found in the *Times* of Wednesday last. The fact of the decrease in houses of the largest type is much to be regretted; but it is to be hoped that better times may alter things a bit, and Mr. Goschen's statistics require amending.



It is really painful to notice in one's country rambles the large percentage of old and new mansions that lie empty and tenantless. In the district where I reside there were till lately three of the finest houses in a desolate condition. One is a unique old Mediæval mansion, and the other two modern ones, with immense estates. Perhaps it may be taken as an encouraging sign of the times that two of them have just been let.

Touching large buildings, I hear that there is to be built an hotel at Vancouver City, in British Columbia, that is to be the largest in Canada, or the States even, is, I believe, to be the terminus hotel of the Canadian Pacific Railway.

All who are personally acquainted with Colonel Duncan will feel that the Registration Bill has fallen into good hands. Best wishes for its success in the House! I trust the funds will not be lacking: the amount required would be a very small claim upon the profession if it were spread over all who wish well to the scheme. Just at the present, as Mr. Edgar Farman intimates, help will be most effective. Already visions of brighter days come to one; and if it be not for ourselves, we may be certain the next generation of architects will bless the remembrance of those persons who have been instrumental in leaving them a better field in which to work: a profession purified of one of the greatest evils that at present afflict it—the existence of those whose watchwords are, "Humbug, Brag, and Bombast." GOTH.

THE CLAMOND INCANDESCENT GASLIGHT.

VISITORS to the gas exhibition held at the Crystal Palace a few years ago will remember the Clamond Incandescent Gaslight, which rivalled the electric arcs in brightness.

That result was accomplished by forcing a stream of heated air and gas downwards into a "basket" or "cone" formed of threads of magnesia supported by a netting of thin platinum wire. In the annexed engraving we illustrate the new form of the Clamond, which it will be seen is in the ordinary position, and dispenses with the necessity for employing machinery to compress air, and force it against the "basket" or "cone" of incandescing material. The improved burners can, however, be had in the inverted form, and on the regenerative principle if desired, thus avoiding the shadows thrown by the ordinary pedestal lamps; but as the new form can be readily adapted to existing fittings, it will no doubt be preferred. The sole agents for the United Kingdom are the Æolus Waterspray General Ventilating, Gas, and Electrical Engineering Company, 124, High Holborn, W.C. The Clamond light has been reported on most favourably by, amongst others, Prof. Foster, M.A., F.C.S; Mr. C. Heisch, F.C.S., gas examiner to the Corporation of London; Mr. Lewis T. Wright, and Mr. E. Field.

The time for sending in designs for the State Soldiers' and Sailors' Monument, to be erected in Central Park, Indianapolis, has been extended from the 12th inst. to the 12th January.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NEW CONGREGATIONAL CHAPEL AND SCHOOLS, MANNINGHAM, BRADFORD.

These buildings have been erected to take the place of Salem Chapel, Manor-row, which has been acquired by the School Board for new offices. The site of the new chapel and schools is an excellent one, situated at the corner of St. Mary's-road and Oak-lane, in a suburb which is gradually becoming fully populated. The building will be erected of local stone in a substantial manner, and the foundation-stone was laid by the Rev. J. G. Miall, who was the first pastor of Salem Chapel, on the 15th of October, 1887. The contracts are let to local contractors, and the architect is Mr. James Ledingham, A.R.I.B.A., of Bradford.

JUBILEE CHILDREN'S HOSPITAL, GATESHEAD.

On Friday last the foundation-stone and four memorial or corner stones were laid respectively by the Hon. W. H. James, M.P., the Hon. Mrs. Parsons, the Mayoress (Mrs. Geo. Davidson), Mrs. James Joicey, and Mrs. W. Clarke. We have given a bird's-eye view of the buildings as they will appear when completed. At present it is only intended to erect the administrative block and one pavilion or ward wing. The administrative block—85ft. by 46ft.—is two stories in height, with ample attic accommodation. The ground floor includes committee-room, waiting-room, separate rooms for nurses and matron, doctors' consulting room, dispensary, and operating room. The kitchen and laundry departments have been well considered, the matron having direct and immediate control of the staff. The bedrooms for the staff are on the first floor and attic story; advantage has been taken of the sloping site for ample cellar accommodation. This block has been so planned by the architect that it can be used for a hospital complete in itself, and for the present will be so occupied. The wing wards are each about 50ft. by 21ft., with day-room ward, kitchen, bath-room, and conveniences, and accommodation for 15 beds to each floor. The arrangement is such that should an epidemic break out the wards can be entirely shut off or isolated from the main building. The sanitary arrangements will include all the most modern and perfect appliances, and the plans for heating and ventilating have received the most careful attention. The material used in the building will be red bricks with stone dressings, the gables being formed with wall timbering, plaster, rough cast, and barge boards. The design is of a simple yet pleasing character, being a departure from the ordinary stern appearance of hospitals. The site of the new structure commands a beautiful view of the river Tyne and Ravensworth Woods, and Lady Northbourne's generosity in presenting the land as a free gift to the committee merits the warmest thanks of the people of Gateshead. Mr. W. H. Dunn (Thompson and Dunn), Newcastle, is the architect, and the contract is let to Haswell and Waugh, Gateshead. The amount for central block is £2,000, and each wing ward £1,000.

THE WOULDHAVE MEMORIAL, SOUTH SHIELDS.

The memorial illustrated to-day is proposed to be erected in a prominent position near the Marine Parks, to serve both as a memorial of Her Majesty's Jubilee year, and of the invention of the lifeboat by Willie Wouldhave, a native of South Shields. The sculptured panels on the four sides will show a bust of Wouldhave, the building of the lifeboat by Greathead, the launch, and the saving of the crew. Twenty-eight designs were submitted in competition, and that by Mr. J. H. Morton, F.R.I.B.A., South Shields, was selected, Mr. R. J. Johnson, F.R.I.B.A., advising the committee in their selection.

ALL SAINTS' CHURCH, CANNINGTON, ALLAHABAD.

The week before last we published some general drawings and a plan, with letterpress description, in illustration of the Cathedral Church of Cannington, in India, which is now being completed from the designs of Mr. William Emerson, F.R.I.B.A., its original architect. To-day we have herewith printed a detail drawing of the west front, showing half the interior and half the outside elevation. The detail is cleverly adapted to Indian requirements and climate, preserving at the same time the character of pure Gothic work as perfected in Normandy and England during the 13th century.

EAST WINDOW, EASTWOOD CHURCH, ESSEX.

This window has just been designed and executed by Messrs. Cox, Sons, Buckley, and Co. It is erected in the church of Eastwood, near Rochford, Essex, as a memorial of the Jubilee of 1887, by Mr. G. Miller. The subject is the "Crucifixion." The style is that of the best period of English glass—namely, that of the 15th century; the three figures are well drawn, and shown as "foreground" figures only, the backgrounds of curtains and trees being used merely as accessories; the extensive use of white glass, with golden "stain" on it, either as "quarries" in the skies, or in the borders, robes, &c., imparts, as in the old glass at Lichfield and Cirencester, great value to the other colours. The robes are covered with rich damasked patterns, and the folds are boldly drawn and expressed by the lead lines. Whilst keeping to the flat treatment essential to painting on glass, still sufficient shading is introduced to give due relief and expression to the countenances and "pose" of the three principal figures. The tones of ruby, blue, and olive green, used in portions of the window, are very harmonious, beautiful effects being produced by the use of "flashed" glass, as in old Venetian examples.

Arrangements have been made by the North-Eastern Railway Company for carrying out railway improvements in Newcastle-on-Tyne of an extensive character. With the exception of the eastern wing of the Central Railway Station Hotel, the remainder of the present hotel premises will be utilised for offices and traffic purposes generally, while the hotel will be extended. There will be additional platform accommodation and a new booking office and waiting room. These alterations will entail the formation of a new street, being a continuation of Westgate-road, which will be a broad 50ft. street from Collingwood-street to the end of St. Nicholas's Buildings.

At a meeting held at Canterbury on the 1st inst. it was decided to take steps for restoring the parish church of St. Alphege, the most ancient one in the city, and now in a state of dilapidation and decay. Plans by Mr. Joseph Clarke, F.S.A., the diocesan architect, were adopted, it being estimated that for absolutely necessary works £760 is required, and for restoration, reseating, and the rebuilding of the tower £2,000. Towards this £600 was promised in the room.

SKETCHES AT THE SALE ROOMS.

We illustrate to-day a few sketches of Decorative Furniture which was sold at Messrs. Phillip, Son, and Neale's rooms a short time since. The Marquetry Commode was of satinwood, inlaid with tulipwood, ebony, &c., and mounted with massive ormolu. The Chippendale Chair was of an unusual character about the back, which was shaped out of the solid. The little Italian Cabinet was a curious piece of work, and was enriched all over with gilded Japanese figures and flowers, conventionally treated, though how these came on an Italian cabinet would be hard to say. The piece of Jacobean work next was curious on account of the network of chased steel that covers it, and this was a characteristic of the best Scotch work of that period, though examples of it are rare, and we never recollect having seen one in a Sale Room before.

WOODROYD BOARD SCHOOL, BRADFORD, YORKSHIRE.

This school is arranged in three departments, forming three sides of a square. There are five classrooms to each department. The total accommodation is for 1,042 children. The cost of school buildings, furniture, playground, forming boundary walls, and outbuildings is £10,411, or £9 19s. 9¾d. per scholar. The architect is Mr. E. P. Peterson F.S.A., of Bradford.

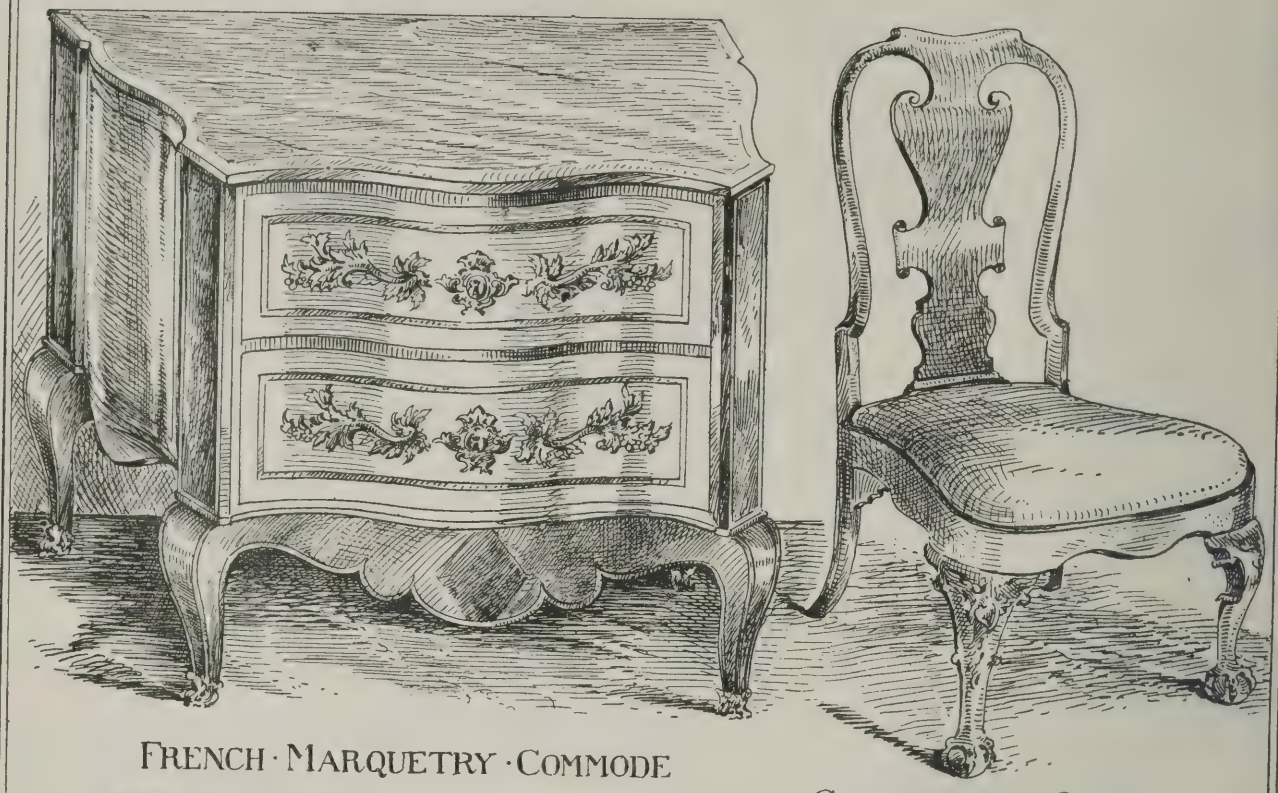
COMPETITIONS.

Manchester.—Designs were last Friday sent in for the School Board Offices about to be erected in Manchester. The competition is restricted to four or five firms of architects in practice in the city. The site is a fine one, standing between three streets with a frontage to each of them.

Walton-le-Dale, near Preston, Lancashire, Competitive Sewerage Scheme.—Some little time back the local board of Walton-le-Dale advertised for schemes for the sewering and disposal of the sewage of their district. In response to this, many schemes have been sent in from some of the most eminent engineers in the country. The ultimate decision as to the merits of the various schemes was submitted to Mr. Thomas Fenwick, C.E., of Leeds, and he has just awarded the first premium to Mr. William Wrennall, C.E., of Liverpool; and the second premium to Messrs. H. T. Johnson and Co., civil engineers.

CHIPS.

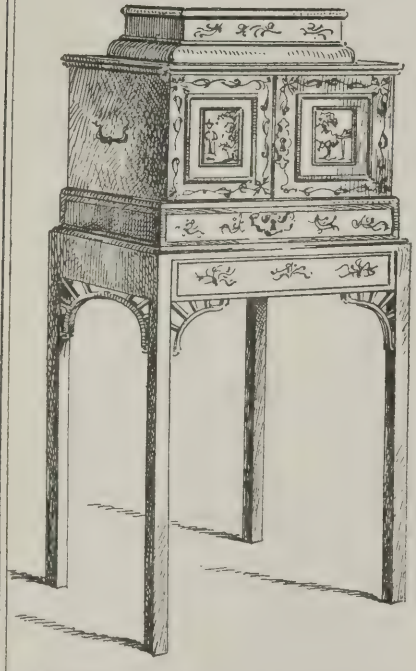
The Bishop of Rochester on Thursday, the 1st inst., dedicated the first instalment of the restoration of the parish church of Chatham. The chancel and two transepts have been rebuilt by Messrs. Goddard, from the plans of Mr. A. W. Blomfield, F.S.A., at a cost of £3,000.



New premises in Southampton-buildings are about to be erected for the Birkbeck Bank and Building Society, from designs by Mr. T. C. Knightley, of Cannon-street, E.C.

Extensive repairs are being carried on at the east end of Lichfield Cathedral. Two or three of the buttresses were in danger of falling, and have been renewed. The mullions, inserted in the windows about A.D. 1802, were mere rubbish, and some of them have been, and the rest of them will be, replaced by new stone. The priceless 16th-century glass was very imperfectly secured when it was fixed in the Cathedral, and needs releading throughout. The third of the seven windows and glass, thus renewed, will be finished before Christmas.

The Great North of Scotland Railway Company propose doubling their main line between Inveramsay and Insch stations, in accordance with plans prepared by Mr. P. M. Barnett, their engineer.



Probate has been granted of the will of Mr. Charles Waring, railway contractor, of the firm of Waring Brothers, and formerly M.P. for Poole. The value of the personal estate was declared at £552,270.

The death is announced, at his residence, Framingham, near Norwich, at the age of 76, of Mr. Christie, formerly head of the eminent firm of art auctioneers.

WOODROYD BOARD SCHOOL, BRADFORD, YORKSHIRE.—Mr. E. P. PETERSON, F.S.A., *Architect*.

BOOKS RECEIVED.

The Transactions of the Civil and Mechanical Engineers Society (published by the Society at 6, Queen Anne's-gate, Westminster) contains papers, mostly illustrated by drawings, by Mr. C. H. Cooper, on "Sewage Treatment at Wimbledon"; Mr. Francis Campin, on "The Design of English and Foreign Iron Bridges"; Mr. W. Lee Beardmore, on "House Drainage"; Mr. H. D. Appleton, on "Rural Sanitary Authorities"; Mr. R. E. Middleton, on "The Forth Bridge," and others. Most of these papers have appeared in full, or as abstracts, in our columns at the time of delivery before the Society.——*International Discharge and Continuous Overflow System of Sewering*, by H. R. Newton, F.S.A., architect, is the title of two pamphlets on the sewage problem—one, a scheme for dealing with the Houses of Parliament, being in the form of a letter addressed to Mr. Gladstone, while the second, treating of the subject in a more general manner, is addressed to Mr. C. T. Ritchie. Mr. Newton's theory is that drains and sewers should be permanently filled, the discharge being by overflow, his idea being by this means to prevent the production of sewer gas and the fouling of the air caused by passing through a contaminated channel.——*Lockwood's Dictionary of Mechanical Engineering Terms*, edited by a Foreman Pattern-Maker (London: Crosby Lockwood and Son), appears from a glance through its pages to be just the sort of handy dictionary required by the various trades engaged in mechanical engineering. The terms selected comprise those used in the drawing office, pattern shop, foundry, fitting, smith's, and boiler shops, many of which are unknown outside the workshop. The practical engineering pupil will find the book of great value in his studies, and every foreman engineer and mechanic should have a copy.

CHIPS.

During the work of scraping the whitewash from the walls of the east end of Peterborough cathedral numerous remnants of frescoes have been found. Some rosettes and escutcheons have also been discovered, but in none are the pigments very brilliant.

A new school chapel was opened at Winshill, near Burton-on-Trent, on Wednesday week, in connection with the United Methodist Free Church. The building will accommodate about 250 persons, and has been erected at a cost of about £500 by Messrs. Lowe and Sons, of Burton.

The Post Office authorities have at length resolved to proceed with the erection of the new post-office at Inverness, for which ground was feued in Queensgate two years ago. The contract for the works has been secured by Mr. Thomas Macdonald, builder, Hilton, Inverness. The building, it is understood, will cost over £10,000, and the works will be commenced forthwith.

The Metropolitan Board of Works have allowed Mr. H. Gundry, district surveyor of Paddington, a special fee of twenty-five guineas, in addition to the usual fees under the Dangerous Structures Clauses, for the exceptional character of his services in superintending the shoring and pulling down of Mr. Whiteley's premises after the last fire.

The parish church of Eccleshall, Staffs., has been recently enriched by the addition of a stained-glass window in commemoration of Her Majesty's Jubilee. It is one of the two-light windows in the north aisle, the subjects being "Abraham Meeting Melchisedeck, King of Salem, and Presenting to Him a Tenth of the Spoils," and "The Priests Proclaiming the Jubilee." Messrs. Burlison and Grylls, of London, carried out the work.

New Wesleyan Sunday schools were opened last week at the rear of the chapel in Unwin-place, Truro. They have been built from designs by Mr. Silvanus Trevail, M.S.A., of that city, the architect for the recent reconstruction of the adjoining chapel, the outlay on the entire scheme having been £7,000. The large hall on the first floor is 63ft. 6in. by 27ft. 6in., and is 25ft. high, and from this hall open out 12 classrooms in two tiers from the ground floor and gallery levels. The contractors were Mr. John Farley for masonry, and Mr. W. J. Tippet for carpentry. Mr. F. Whetter has acted as the clerk of works.

At Clinstone Church, Devon, special services were held last week in celebration of the erection of a new organ, built by Messrs. Voules, of Bristol, at a cost of £300, and the re-hanging of the six bells in the tower, a work carried out by Mr. Aggett, of Chagford.

Building Intelligence.

CURDRIDGE.—The memorial stone of the new church of St. Peter, Curdridge, Hants, was laid on Tuesday week. The church replaces a dilapidated and small structure built fifty years since, and will cost above £4,000. It will seat 240 persons, and will consist of a nave, chancel, west tower, and organ chamber, and vestry on the north of the chancel. The walls will be faced with flint work and dressings of Box Ground stone externally, and internally with chalk. There will be a half-timbered porch of solid oak framing on the south side. The building of the tower will be deferred; but the foundations have been put in. It is intended to be 22ft. square and 70ft. high to the top of the stair turret. The style adopted is 15th-century Gothic. The stonework and flint will be surmounted by a roof of red tiles. The chancel is to be laid with black and white marble, and the nave with stone, and wooden floors will be provided under the seats. The length of the nave will be 64ft. and the chancel 32ft., while the span of the former will be 27ft. and of the latter 21ft. Mr. G. Dobson, of Colchester, is the builder, and Mr. T. G. Jackson, M.A., F.S.A., of London and Oxford, is the architect.

HAUGHTON.—The parish church of St. Giles, Haughton, Staffs, was reopened on Nov. 29th, after the rebuilding of the chancel and restoration of nave, from plans by Mr. J. L. Pearson. The building was rebuilt early in the 18th century in the plainest fashion. In the present works the south wall of nave has been taken down and rebuilt on the old lines; but in rebuilding the chancel it has been lengthened by 9ft. The whole of the roofs are of necessity new and are of oak. The nave roof is of nine arched trusses, dividing the space into eight bays of about 5ft. each, and springing from moulded wall-plates and framed into moulded rafters and collars. There are three smaller common rafters in each bay, with upright struts from the wall-plates supporting a moulded cornice, or purlin; above this are two other purlins. The many divisions give an effect of great length and richness. The nave is lighted on the south side by three new windows of three lights each, in the Transition Decorated style, and with tracery in their square heads. The chancel roof is similar in general character to the nave roof, but more enriched. The ridge is on the same level as that of the nave, the side walls being 2ft. higher and the chancel itself nearly 4ft. narrower than the nave. An effect of much greater height is obtained. The chancel is rebuilt in the style of the early part of the 13th century. The east window is a triplet of lancets, widely separated. This is filled with painted glass representing the Crucifixion of our Lord in the centre light, with St. Mary and St. John in the two side-lights, executed by Messrs. Gibbs and Howard, of London. The reredos is of Caen stone, and the stalls are of oak, with solid, shaped ends, terminating with poppy-heads. The pulpit will be of Caen stone with red marble shafts, hexagonal in plan. The organ is in course of re-erection, with improvements, by Mr. Pickett, of Wolverhampton. Mr. G. J. Muirhead, of Newport, Salop, was the contractor. Unhappily, a fire broke out on his premises on October 10 and destroyed all the wood floor blocks and a large amount both of the old and new oak belonging to the church, but Mr. Muirhead determined to try and be ready for the date fixed for the reopening, and was successful. The total cost has been about £2,000.

MORETON-IN-MARSH.—The memorial hall which has been erected to the memory of the late Earl Redesdale at Moreton-in-Marsh, was opened on Friday last by Sir M. Hicks-Beach. The architects are Messrs. Ernest George and Peto, and the builders Messrs. Peto Bros., of Pimlico. The main floor of the hall is floored with oak, with a stone chimneypiece, and with windows on each side of the hall bearing the arms of the family of Lady Clementina Mitford, the daughter of the late and sister of the present Earl of Airlie, and of Mr. A. B. Freeman-Mitford, C.B., the donor, who was, up to the time of the death of his cousin, the late Earl of Redesdale, Secretary to the Commissioners of Public Works. The building is in the Tudor style, and built of Cotswold stone, raised on the Batsford estate. The building was illustrated in our issue of May 13th last.

PARTICK.—The railway station at Partick, near Glasgow, is undergoing enlargement and reconstruction. Greater accommodation was required, and this has necessitated an entire reconstruction of the buildings and rearrangement of the entrances and exits. New accesses are being formed on three sides. New buildings are being erected on both platforms. They are of brick, the elevation to the railway being of wood and glass, on which side is a verandah, about 14ft. broad, extending the whole length of the building. The accommodation for the public and for traffic requirements is ample. The plans were prepared by the company's architect, Mr. A. G. Gordon. Messrs. Kinnear, Moodie, and Co., Glasgow, are the contractors, and Mr. George Mellis is clerk of works. The cost of the improvements will be about £4,500.

SOUTH SHIELDS.—A parish church, to be dedicated to St. Aidan, has been erected on a corner site near the North Marine Park. The character is Early English, verging on the transition to the Decorated style. Owing to the site sloping from north to south, the floor of the church is 15ft. above the adjoining back street. The basement is utilised for a parish room beneath the chancel; and large choir and clergy vestries under the south aisle. The church has sitting accommodation for 612 persons, and the plan comprises nave with aisles, chancel, and organ chamber. The nave is of five bays, lighted by lofty clerestory windows of two lights each. The internal dimensions are:—Length, 118ft.; width, 55ft.; height, from floor to ceiling, 40ft. The walling throughout is of rubble, with sneck facing and chiselled stone dressings. The mosaic floor of the chancel is raised three steps, and the altar table is raised four steps more. The ceilings are divided by moulded ribs into panels, filled with plaster in the nave and aisles, and pitch-pine in the chancel. The whole of the internal fittings are of pitch-pine, and the windows are filled with leaded glazing of cathedral tinted glass. The east window is of three lights, the centre one being of stained glass, representing the Crucifixion. The church was designed by Mr. J. H. Morton, F.R.I.B.A., of South Shields, and the contract for building has been carried out by Mr. Robert Allison, of Whitburn. The buildings and site have cost over £4,500.

TRURO.—At the annual meeting of the Truro Diocesan Conference held on the 1st inst., the following report with regard to the Cathedral was received from Mr. J. L. Pearson, R.A.:—I have now the pleasure of congratulating the committee on the successful completion of the first portion of their undertaking. It has been a great source of satisfaction to me that the committee were enabled, not only to complete the substantial part of the structure as far as the first bay of the nave, but also to order by far the greater part of those internal fittings and adornments so essential to a Cathedral; and I also rejoice that these works—several of them ordered at the last moment—were practically completed before the day of consecration. I should like to call attention to the works (comparatively few in number) which are yet incomplete, and first amongst these I must mention the organ. I trust some arrangement will be at once made with Mr. Willis to fill in the necessary pipes to complete the front, and that at no distant date the oak case now so much needed will be added. As important as the organ, if not more so, are the completion of the stalls at their western end, and the erection of something in the nature of a screen to protect the choir. It is obvious that the present lighting of the Cathedral is temporary, and I hope that suitable coronæ (which, perhaps, may cost £7 or £8 each) will ere long replace the present fittings. A portion of the carving of the south porch will still remain unfinished when the amount devoted by Canon Phillpotts for this purpose has been expended. Until the remainder of this carving is completed, and the panels and niches are filled with sculpture, the effect of the design cannot be realised. I may also mention the levelling, laying out, and fencing of the Cathedral precincts. In conclusion, I would express the hope that we of this generation may live to see the completion

of what remains to be built—viz., the central tower, the nave, aisles, porch, and west front.

WALSALL.—The new Church of St. Andrew, erected in the populous and poor district of the Birchills, Walsall, was consecrated by the Bishop of Lichfield on Wednesday week. It is a plain edifice of Gothic character, faced externally with red bricks and a tiled roof, a bell turret covered with oak shingles. Internally the walls are faced partly with red bricks and partly with plaster, the pillars and window-sills being of stone, and the roof an open one of pitch-pine. It consists of nave, north and south aisles, a lean-to narthex, opening into the naves with three arches, chancel, morning chapel, organ-chamber, and choir and clergy vestries. The floor of the nave is of wood blocks, and that of the chancel of tiles; and the structure is heated by means of Gurney stoves. The internal dimensions are:—Length 124ft., breadth 51ft., and height 27ft. 6in. to the wall-plate, and 50ft. to the ridge; and the seating accommodation, by chairs, is for 700 persons. The architect is Mr. J. E. K. Cutts, of Southampton-street, Strand, London, and the builder Mr. A. Lynex, of Walsall. The cost of the church and fittings has been £3,500.

WALTON, LIVERPOOL.—St. Mary's Parish Church, Walton, was reopened on Friday week by Bishop Ryle after restoration. The first section of the work, the decoration and repair of the sacrarium, was carried out in 1882. The present work has cost about £2,300, exclusive of the new organ to be built, at an outlay of nearly £600. The principal improvements are the removal of the north and south galleries, the reconstruction and reseating of the western gallery, and forming a new staircase thereto; the removal of old seating and furniture, and reseating with pitchpine benches; the concreting of the floor area, and the laying of a new floor; the building of a choir vestry; the formation of a chancel with choir stalls, and new pulpit (the latter in lieu of a "three-decker," which formerly blocked up the central passage); the introduction of a new heating apparatus; the replacing of the ancient font in lieu of the modern one recently in use; the changing of the position of the memorial monuments; the reglazing of the windows with coloured glass, and the decoration of the walls of the buildings. Two of the windows are filled with stained glass subjects. The chief contractors for the work were Messrs. Kelly Bros., of Walton. The architects were Messrs. Aldridge and Deacon, of Liverpool.

CHIPS.

A Primitive Methodist chapel at Hutton Radley, North Yorkshire, was opened on the 1st inst. It seats 220 persons, has a school and classroom attached, and was built from plans by Mr. Geo. Race, of Westgate, Weardale.

About £10,000 has now been raised to meet the Bishop of Chester's proposed fund of £80,000, for the purpose of building ten new churches and fifteen mission rooms in the rural deanery of Stockport.

The first sod of the Warrington section of the Manchester Ship Canal was cut on Wednesday week, and operations have now been actively commenced under the supervision of Mr. Squires. Mr. T. A. Walker is, it will be remembered, the contractor for the canal.

The contract for the removal to, and re-erection of Temple Bar at Theobald's Park, Cheshunt, Herts, for Sir Henry Meux, Bart., is being carried out by Mr. Samuel Elliott, of the Albert Works, Newbury.

Last week the Bishop of Lichfield consecrated a new vestry which has been added to St. Mary's Church, Stafford-street, Wolverhampton. The north transept has hitherto been utilised for the purposes of a vestry, and that space will now give accommodation for 60 worshippers. The vestry, which is 36ft. by 20ft., with a height of 25ft., has been erected by Mr. H. Willcock, from the designs of Mr. T. H. Fleeming, at a cost of £600. The style is similar to that of the church.

At the Bankruptcy Court on Wednesday, Alfred Bath Baker, described as a builder, of the Lodge, Ealing-green, applied for an order of discharge. His statement of affairs showed debts amounting to £6,638, and there were no assets. Mr. Registrar Giffard, on the ground that the bankrupt's books were not such as sufficiently disclosed his business transactions and financial position, suspended the order of discharge for one year.

Engineering Notes.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—The opening meeting for the present session of this society was held on Wednesday evening, at the Town Hall, Westminster, when an inaugural address was given by the president, Mr. Reginald E. Middleton, M.I.C.E., who referred with satisfaction to the fact that during the past session a committee of the council had drafted a Bill on the Sanitary Registration of Buildings, which had been favourably received and commented upon. He then dealt with the question of technical education, and emphasised its need for all engineers.

RAILWAYS IN NORTH CORNWALL.—The railway in course of construction from Bodmin to Wadebridge is making satisfactory progress, and will be opened throughout on February 1st. The section of the line from Bodmin to Boscarne Mill is being made by the Great Western Railway Company. From the latter place to Wadebridge, which is a part of the old Bodmin and Wadebridge Railway, the line is being re-laid, straightened, and improved by the South-Western Railway Company. The station at Wadebridge is commenced, and there is no doubt that the railway when completed to Wadebridge will be continued to Padstow, seven miles further. Early in the coming year, too, the second section of the railway from Launceston to the Delabole Slate Quarries will be commenced.

WICK.—The widening of the north quay of Wick Harbour to the extent of 15ft. is making favourable progress under the direction of Mr. Barron, C.E. The foundation of the extension is being formed of concrete, of which three blocks, each 22ft. in length, have been laid, and the upper portion of the quay is being built of dressed and coursed stone taken from the local quarries. The quay is also being lowered 2ft. to bring it to the same level as the south quay. When finished it will have a breadth of 39ft., as compared with 24ft. formerly. The steam dredger continues to work day and night in deepening the harbour; and as most of the large boulders which were embedded in the clay bottom have been removed, the work of deepening is now making good progress. The work when completed will give throughout the harbour a depth of 8ft. at low water.

A reredos has been presented to the church of St. Mary the Virgin, Greenhow Hill, near Leeds, designed by the Rev. J. Stanley Tute, vicar of Markington, and the carved work and illuminating have been executed and given by him. A new credence and sedilia have also been given. The reredos is of carved oak; the central portion has three square panels, filled with red and green figured silk of ecclesiastical pattern.

The town council of Warrington have disposed of the encaustic tiles found during the recent excavations on the site of the Friary in that borough, by ordering that a sufficient portion of the tiles to represent the design of the pavement be framed and hung on the wall of the Antiquities Room of the Museum; that specimens of each kind be exhibited in the cases; and that the remainder not required for the museum be given to the vicar and wardens of Holy Trinity, on condition that they lay them down in a suitable place in Trinity Church.

Operations in connection with the Thirlmere waterworks have been in progress in the Troutbeck Valley for some months, and the tunnel through Moor How, from the direction of Kendal, has now penetrated 100 yards, in addition to which offices and engine-houses have been erected, steam engines having been at work in the latter for some time. On the Hugill side of Moor How the works have been much longer in operation, and are further advanced.

The new chancel of the Abbey Church, Shrewsbury, built from designs by Mr. J. L. Pearson, R.A., was consecrated on Monday. The whole of the work has been executed by Messrs. E. Abley and Co., builders, Salisbury, under the superintendence of Mr. Thomas Athey, clerk of works, with Mr. W. Cowley, foreman; the carving of stalls and other fittings is by Messrs. Luscombe and Son, of Exeter; the glazing of the windows was done by Mr. Jackson, of London; and the old heating apparatus has been re-arranged and extended by Mr. W. B. Morris, of Shrewsbury.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EXETER DIOCESAN ARCHITECTURAL SOCIETY.—A paper on "Romanesque Work" was read by Mr. E. Ashworth before this society at the College Hall, Exeter, on Friday last. Mr. Ashworth described the great works undertaken directly after the Norman Conquest in the principal cathedrals of England, the new bishops removing Saxon work and substituting the noblest and most majestic Romanesque. Durham might be taken as the foremost example, and Norwich, Ely, Peterborough, Oxford, and Winchester retained at the present day the stately arcades of the 12th century. Notice was taken of some few picturesque parish churches of the same date, such as Tickencote, Castle Rising, Barfreston, and also of crypts, which, even to parish churches in some cases, evinced much skill and ability in their design, and might give lessons to the architect of the present day. Descriptions were given of different abbey churches—Romsey, Tewkesbury, the Hospital of St. Cross, near Winchester, and Waltham Abbey. The paper was also illustrated with a number of drawings in water-colour, photographs, and engravings.

MANCHESTER ARCHITECTURAL ASSOCIATION.—A meeting was held on Tuesday week, the President (Mr. A. H. Davies-Colley) in the chair. Mr. John Slater, B.A., president of the London Architectural Association, read a paper on "Modern Architectural Education." He commenced by saying that Vitruvius's writings on the requirements of an architect, nearly 2,000 years ago, applied with almost equal force in the present day, and used them as the text of his paper. In addition to the recognised course of study, he said it was desirable to practise modelling, and history was necessary in the study of architecture to understand the conditions under which the various styles were developed. Messrs. Booth, Freeman, Hodgson, and others took part in a discussion which followed.

NORFOLK AND NORWICH ARCHÆOLOGICAL SOCIETY.—A meeting of this society was held in the Ethelbert Gate, Norwich, on the 28th ult., Dr. Bensby in the chair. Among the objects of interest exhibited was the book of the Carpenters' Company, Norwich, commencing 1594, lent by Mr. Walter Rye. Mr. Mark Knight read a paper setting forth a number of facts tending to show that "Strangers' Hall," in the parish of St. John in the Maddermarket, was originally the Hall of the Guild of St. George. Mr. Willins had stated that there was no clue as to who erected the building, which is of the Perpendicular period, as shown by its porch and window, but stands on crypts of the Decorated period. Upon the character of the carvings and the spandrels portrayed, Mr. Knight based the argument that the hall was built some time in the fifteenth century, for a semi-religious society, which held St. George in special veneration, and such a Guild was incorporated by Henry V., and purchased fresh premises, now covered by the City Free Library in the reign of Henry VII. Mr. Beecheno read some memorials of St. Andrew's parish, based on "The Cambridge Chest," containing wills and accounts between 1555 and 1676, and the Rev. W. Hudson a paper on "The Early Court Leet Rolls of Norwich."

SOCIETY OF ANTIQUARIES OF SCOTLAND.—The annual general meeting of this society was held on the 1st inst., Professor Duns, D.D., in the chair. The office-bearers for the ensuing year were elected as follows:—The Marquis of Lothian, president; Norman Macpherson, LL.D., Sheriff of Dumfries and Galloway, the Earl of Stair, and Mr. Robert Herdman, R.S.A., vice-presidents; Mr. J. R. Findlay and R. W. Cochran-Patrick, LL.D., secretaries; Mr. W. Forbes and Thos. Dickson, LL.D., foreign secretaries; Joseph Anderson, LL.D., assistant secretary; Gilbert Goudie, treasurer; R. Carfrae and John J. Reid, curators; Adam B. Richardson, curator of coins; and John Taylor Brown, librarian. The members of the council, in addition to the office-bearers, are—Sir Noel Paton, Francis Abbott, Sir Arthur Mitchell, Dr. David Christison, Sir Herbert Maxwell, Professor Masson, Thos. G. Law, Sir W. Fettes Douglas, and Professor Sir W. Turner. The number of members added during the year has been 43, and deducting the losses by death and

resignations, there has been a gain of 17—the total number of Fellows being now 689. The annual report of the museum showed that it had been visited by 67,261 persons during the year, and had received 156 donations, while the donations to the library amounted to 697 volumes. During the year 2,089 objects of antiquity had been purchased for the museums and 64 volumes for the library.

SCHOOLS OF ART.

WOLVERHAMPTON.—The annual meeting for the distribution of prizes was held on Friday night. The report showed that the number of students attending the school during the year was 394, an increase on the previous year. The advanced work, while reaching a high standard, was still very far behind what they had anticipated, and what they hoped would be attained in the future. The prizes having been distributed, Mr. A. Harris, of Bradford, said that for 34 years the South Kensington Department had endeavoured to get hold of the artisan, but had failed owing to the plethora of objects in the museum, which led the students astray. A large measure of artistic ability existed amongst the artisans, but it had remained dormant owing to a want of development and practical training; and now this artistic ability was being developed by schools in the provinces which had fewer resources at their disposal. If they were to further the movement of artistic training it was necessary to consider in what points the present schools were defective, and what means should be employed to make them more efficient in the future. In any system of art instruction it was necessary that two cardinal points should be considered. They must first insure an association of trade with the schools, and they must then secure teachers versed in the requirements of trade as well as the principles of art. It was also desirable that each centre of industry should have under its control a number of good models and examples bearing upon the special trades of the district. The energies of the schools, in short, should be directed to the teaching of art as applicable to the industries of the country, and not to the teaching of art in the abstract, which should be of subordinate importance. Another desirable change was the holding of local exhibitions of the works of art students. Unless some such methods as these were generally pursued, no radical improvement would be made.

CHIPS.

The new Home of Industry, Bethnal Green-road, E., was opened on the 18th November. A building has been purchased and fitted up at a cost of over £8,000 for the purpose of training boys for emigration and other philanthropic work, carried on by Miss Macpherson. The architect was Mr. George Baines, 4, Great Winchester-street, E.C. The contractor was Mr. H. L. Holloway, of Deptford.

Mr. Harry Page Woodward, eldest son of Dr. Henry Woodward, F.R.S., of the British Museum (Natural History), who has served for more than three years as Assistant Government Geologist in South Australia, has been appointed Government Geologist for Western Australia, embracing an area of 975,824 square miles, being the largest of the Australian colonies. Only a very small portion of this enormous area has at present been examined by a geologist.

The Glasgow Art Club has elected Mr. Joseph Henderson president, Mr. A. S. Boyd vice-president of the artist section, Mr. Henry Johnston vice-president of the lay one, Mr. Thomas Morton, jun., hon. secretary, and Mr. William Adam hon. treasurer.

At Manchester the Arts Committee of the Royal Institution have decided to throw open the current autumn exhibition, and also the permanent collection, free to the public for five Sundays, between the hours of 2 and 8 p.m.

New vaults and warehouses are being erected for Messrs. McKenna, at the corner of Gould-street and Rochdale-road, Manchester. The fronts to Rochdale-road and Gould-street are being faced with Aberdeen granite and Edwards's pink-coloured bricks. The whole of the dressings, such as strings, labels, copings, and cornices are in granite. The cost of the work is £5,150, exclusive of fittings. Messrs. Wilson, Toft, and Huntly are carrying out the contract under the superintendence of Messrs. Alfred Darbyshire, F.R.I.B.A., and F. Bennett Smith, the architects.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., and XII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—H. F. S.—F. R. O.—I. L. Bd.—H. L. B.—L. H.—F. W. H.—M. W.—A. A. and Co.—W. B. S. B.—E. H. S.

L. HANSON. (We really must decline to act as architect on your behalf to the gentleman who wants the half-timber lodge, and will not sacrifice his gateposts. One thing is quite certain, the two are incompatible; but that probably won't matter.)—JUNIUS. (No such Act has been passed. The judges in two important cases have decided that the client can claim the drawings, and we have repeatedly referred readers to them. Our own opinion is that if the profession were thoroughly united and represented by an efficient corporate body, a more satisfactory interpretation of the law might be arrived at. At present an architect should always take care to stipulate that he shall retain the drawings—copies of course may be furnished.)

ADDRESS WANTED.—Will Mr. Wm. Crake, who kindly offered to send us some old engravings, kindly send us his complete address?—as our reply to him has been returned through the Dead Letter Office this week.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.

"LEONHARDT," "Coila," "Aughrim," "Beamish Boy," "Simplex et Prudens," "Mayfly," "Boreas," "Economy," "Northumberland," "Nemo," "Tat," "Angle," "Nabob," "Milosis," "Pedro," "Abington," "Etna," "Jack," "Venator," "Lucilius," "First Attempt," "Buggins," "Streona," "Ars Longa," "Rab," "Ossian and Harp," "Bee," "Wulfruna," "Apex No. 1," "Transome," "Elean," "Cromaboo," "Recruit," "Chimo," "Hercules," "Glenco," "Tempus Fugit," "Towser," "Acute Angle," "Midas," "Brickbat," "Netsukie," "Cosmos, junr.," "Texas Bill," "Alban," "Civis Mundi," "Beaumont," H.M.S. Conway," "Westminster," "Midland," "Spare Time Well Spent," "Solus," "Ye Jumping Frog," "Ghost," "Rob Roy," "Young Albion," "Lotus," "Uncle Toby," "Bagged Ape," Uncouth Swain," "Faith," "Liso," "Hudibras." The remainder were acknowledged last week.

F. R. (The carriage or cart-house adjoining the smithy is intended for use in connection with either the wheelwright's shop or the smithy, and is simply a standing for carts and other vehicles. The instructions are clear enough. See reply to "G. C." A w.c. or e.c. clearly should be provided, and urinal.)—G. C. (1. No stabling for horses is asked for with the smithy; but, of course, standing room for, say, four horses inside the building must be provided as a matter of course. 2. No yard behind is asked for. There would be a space, no doubt, for carts and timber, but this need not be drawn on the sheet on account of space. 3. "One roof" means exactly what it describes. There may be dormers. The wheelwright's shop of course will have a roof of its own.)—A. GREIG. (Yes; an ordinary corner site, not an internal angle plot in the corner of a square.)—ALFRED YATES. (All drawings are returned in due course. You must wait your turn.)

Correspondence.

ARCHITECTS' AND ENGINEERS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—In response to the invitation of the Architects' and Engineers' Registration Act Committee, local honorary secretaries have already been appointed in the following places, for purpose of making known the object and scope of the proposed Act:—Ashton-under-Lyne, Brighton, Birmingham, Banff, N.B., Barnsley, Bath, Cheltenham, Cardiff, Cork Dublin, Dundee, Elgin, Exeter, Edinburgh, Gloucester, Godalming, Hull, Hastings, Jersey, Leamington, Llanrug, Liverpool, Norwich, Newcastle-on-Tyne, Penzance, Redruth, Ryde, South Shields, Southsea, Southampton, Torquay, Truro, Weymouth, Wrexham, Walsall, York.

It is proposed to appoint local secretaries in every important town in the United Kingdom, and I shall be obliged if gentlemen willing to act as hon. local secretaries in towns other than the above mentioned, will kindly communicate with me at once.

The duties will not be very arduous, the most important steps being to interview members of both Houses of Parliament in their localities, and to obtain signatures to a petition praying that the Bill may pass into law. When complete, the full list of local secretaries will be published.—I am, &c.,

EDGAR FARMAN, hon. sec.
39, King-street, Cheapside, E.C.
London, Dec. 6th.

SIR,—In pursuing the Draft Bill, I have been somewhat puzzled by certain clauses contained in schedule (C). They are these:

In the form of certificate requiring to be signed on behalf of the applicant the term of assistantship prior to January, 1887, is required to be entered. An asterisk from this clause directs attention to a note in which it is stated that unless the term of years is eight and upwards, a certificate of examination must be produced.

In the form of certificate requiring to be signed *by* the applicant, the term of years counts back from the date of the passing of the Act. This is also the evident rendering of Section XIX. (7) (*c*).

What is the meaning of this apparent discrepancy? If eight years of assistantship prior to the passing of the Act (which from all appearance will be 1888) is sufficient, then it would seem that the asterisk referred to would more properly have been placed in the form of certificate requiring to be signed by the applicant.

By the way, can assistants rely that this term of years includes apprenticeship? This question was asked in your columns several months ago, and was answered in the affirmative with apparent authority, but by one who did not write above his name. The Bill does not contain any reference to the matter.—I am, &c.,

MAKE SURE.

THE DRAUGHTSMEN'S PROVIDENT FUND.

SIR,—May I, as a member of the committee, be allowed to say a few words on the above subject, and to heartily endorse the remarks of "R. C. W. D." in last week's BUILDING NEWS.

I may inform those who are thinking of becoming members of the Society that everything is being pushed forward with all possible speed, and that a public meeting will be held at the earliest date, so as to commence the Society without delay. I may state that the Committee propose that the first 100 applicants for membership shall be admitted without paying the customary entrance fee.

Intending applicants, who are anxious to know the objects of the Society, should at once communicate with Mr. G. A. T. Middleton, the secretary, St. James's Hall, Piccadilly, London, and they will obtain all necessary information at an early date, as the rules are now in proof.

To give some idea as to whom will be eligible as members, I may say that the term "draughtsman" will include all those who are employed

in an architect's, civil or mechanical engineer's, or surveyor's, office, or who are in any way connected with the accessory arts.

The Committee will feel much obliged to anyone who will forward their names as willing to act on the Committee.

In conclusion, let me urge upon all those who are eligible to come forward in large numbers, so as to assure the success of the society. The committee are doing their utmost; but, of course, they rely upon outsiders to assist, and if they only receive the support they are entitled to expect, the society is sure to prosper.—I am, &c.,

S. Huntley Egan.

22, Hargrave-road, Junction-road, Upper Holloway, N.

Sir,—I am desired by the committee which has been appointed to draw up the rules for the establishment of the above Society to ask permission to state in your columns that these are now nearly ready, the only thing required being the sanction of the Registrar of Friendly Societies. As they have been drafted upon the same lines as those of a society which is already registered, it is contemplated that there will be little delay, and it is hoped that the Society may start upon a career of usefulness by the beginning of next year. Gentlemen who intend to join would much oblige by communicating with me at once, and I will send them a copy of the rules, together with the necessary forms of application as members. The first hundred members will be admitted without the payment of an entrance fee; but after that an entrance fee of 5s. will be charged to each. The tables upon which sickness allowance and life assurance will be granted have been decided upon as low a scale as is consistent with successful working. To secure an allowance of one guinea per week for the first 13 weeks during illness, and of half this sum for a further period of 13 weeks, a man aged 20 last birthday will have to pay 7s. 8d. a quarter; and to insure £25 to his successors at death will have to pay 2s. 5d. a quarter until he reaches the age of 65. Larger sums can be assured at sickness and smaller at death at similar rates. It is also in contemplation to form a loan fund, but the details of this have not yet been worked out. The committee are empowered under the rules to use 10 per cent. only of the premium receipts towards the expenses of management. This may not suffice during the first few months, and, therefore, I should be glad to receive special subscriptions to meet the initial expenses from members of the profession who wish well to the movement.—I am, &c.,

G. A. T. Middleton, A.R.I.B.A., M.S.A., Hon. Sec.

St. James's Hall, Piccadilly, W., Dec. 2.

ST. ALBAN'S ABBEY.

Sir,—I noticed with interest some remarks by "Goth," in the Building News of the 25th ult., and also a letter which appeared in your issue of the 4th, with regard to the restoration (as I have seen it termed) of St. Alban's Abbey.

I suppose there is now no hope—no possibility, in fact—of saving the building from the clutches of Lord Grimthorpe. It really appears simply to be a question of time and money whether he will be able to entirely rebuild the Abbey, or whether there will be some few fragments saved to enable future generations to (mentally) reconstruct it as a palæontologist reconstructs an extinct animal from a single fossil bone.

But, although it may not have any direct beneficial effect in the present instance, I do think some form of public or professional protest should be made against this vandalism, if only to prevent a like fate befalling any other of our old buildings. Imagine Salisbury or Lincoln being gradually rebuilt by some rich "amateur architect" who happened to be able to afford the amusement!

I inclose for your own inspection three prints from negatives taken a few weeks ago of the "condemned" north transept; the angle turrets have already been taken down. One shudders to think of what the transept will look like when it has been re-erected; possibly, it will be an exact replica of the present south transept, which although the Rev. Precentor Venables in his address to the Archæological Institute last August described it as "new, well-built, carefully-designed, and attractive," is not an erection that many other people of taste could, I think, say as much for.

It is, doubtless, from one point of view, a good thing that Lord Grimthorpe should spend his spare cash in promoting the building-trade; but why doesn't he raise these erections of his in his own garden, where he could enjoy the leisure contemplation of them himself, and where they would be comparatively harmless?

Hoping that the matter may yet be taken up influentially—I am, &c., H. L. Field.

Lattimore-road, St. Alban's, Dec. 6.

ASSISTANT SURVEYORS R.E. DEPARTMENT EXAMINATIONS.

Sir,—Judging from "Prospero's" remarks in your last issue upon the above subject, I conclude he is quite ignorant of the duties which the assistant surveyors or the district surveyors of the R.E. Department are called upon to perform. It may be that he has been misled by the term "surveyor," which, if it applies to us at all, does so in our capacity as building or quantity surveyors, and not as land surveyors, as levelling and land surveying are not included in the list of our duties as laid down for us in Vol. V. of the Army Regulations, which are as follows:—

(*a*) The superintendence of works in progress, and keeping up any purely professional records in connection therewith.

(*b*) Attending at quarterly or other inspections as may be directed. (This refers to inspections of buildings).

(*c*) The preparation of details for services not taken up by the district surveyor.

(*d*) The preparation of plans or designs and specifications when necessary.

(*e*) The measurement, in company with an engineer officer when practicable, of services not taken up by the district surveyor.

(*f*) Assisting or sharing in the duties laid down in Par. 999, as may be directed by the commanding Royal Engineer. (The duties here referred to are those of the district surveyor).

It will be seen from the above that the additional subjects which "Prospero" proposes should be added to future examinations are quite unnecessary, although I do not wish to be understood to mean that some knowledge of the subjects might not, at some time or other, prove of advantage to those professionally engaged in the R.E.D.—I am, &c.,

An Assistant Surveyor, R.E.D.

Sir,—I agree with "Prospero" that "Modern Sanitation" and the "Use of Surveying Instruments" might with advantage be added to the list of subjects set to candidates for Royal Engineer appointments. I think, however, that "Euclid" should remain on the list, although "Trigonometry" might be dropped. I would further propose that "Mechanics" and a "Modern Language" should form two of the optional subjects, and that "Specifications for Building Works" be added to the "obligatory" list.

Besides these additions to the list of subjects, there ought to be, in my opinion, a practical examination as to the properties, uses, and market values of materials. For instance, specimens of bricks, wood, iron, slate, cement, &c., could be set before the candidates as in some of the excellent examinations held by the Science and Art Department at South Kensington. This test, I need hardly say, should be compulsory.—I am, &c., Norseman.

SALISBURY CATHEDRAL.

Sir,—Francis Price, who for some twenty years was surveyor, or, as we would better express it, clerk of works for the repairs to this cathedral, published in 1753 a work, illustrated with plates, in which he gives in his own quaint, pendantic, yet interesting way, several tests which were applied to ascertain the perpendicularity of the tower and spire.

Sir Christopher Wren, in his survey of 1668, ordered the removal of some timbers in the tower and spire, that a plummet might be let fall from the highest part possible to the pavement, and a mark was made of the centre of the plummet on the pavement for future repetition; this was tested in 1681 and 1736 by the two Naishs, father and son, clerks of works, and found correct. Wren found there was a declination to the south of 27½in., and to the west 17½in.

It would be very interesting to know by later historians what testings have taken place, more especially late ones, and if the pavement mark be still there. When I visited the cathedral a few years ago, I was not then aware of this. Price himself plumbed the work in sections, and came to almost the same conclusion as Sir Christopher, and found the greatest declination in upper part of the spire. He also describes a very ingenious method adopted by Mr. Mill in 1737, which is better to give in his own words with its grammar and spelling.

"My Lord Bishop called in the judgment of James Mill, Gent. of London, who suggested another method, almost as easy to repeat as the former. To proceed the more exactly with this, we first found the true centre of the building, or rather the centre of the four grand legs. From this centre a line was produced due west, al least such a line as the form of the building pointed out to be so. The like care was taken to produce another line directly north, which was continued as far from the building as was manageable for a wall in the churchyard. At this place a triangle of long poles was raised, united at their tops and spreading at bottom. From a point on top a line, with a plummit of sufficient weight hanging by it, was let fall into a vessel of water, in order to hinder, as much as possible, the vibration of the line and plummit. The vessel of water and the poles was moved till it was judged that the plumb-line did rest upon the said north line. This being fixed, a lighted candle was placed upon the west line in the church that was produced from the centre; and this candle was moved till it was agreed by persons standing behind the triangle of poles, who could see the middle of the capstone, or ball of the spire, and the light of the candle, that they were cut exactly by the plumb-line. This agreeing by several viewings from behind the poles, the centre of the candle was marked upon the pavement, and measured sixteen inches and a quarter from the true centre, consequently the total declination to the west. This was done July 18, 1737, in the presence of my Lord Bishop and others."

He then says the west line was also continued as far from the building, &c., the triangle fixed, also vessel of water, plummet, &c., when it was found the total declination to the south was 24½in.

My method would be by trigonometry, by taking angles of elevation from the extremities of these E. and W. and N. and S. lines to the highest point of spire, when triangles will be formed, whose bases and angles at same are given, whence the sides can be easily calculated, the perpendiculars and their distances from centre.

Perhaps some of your contributors may suggest some other method.—I am, &c.,

Belfastiensis.

N.B.—A diagram at 4 or 5ft. scale, accurately constructed, with these dimensions and angles, would give the same.

A CORRECTION.

Sir,—I beg to call your attention to an error in a paragraph in yours of Nov. 25 *re* opening of church at Knottingley, which may do me harm, and would be glad if same is corrected. I only saw it this week.

It says: "Messrs. John Hall Thorp and Sons, Leeds, have done the joinery work." They only executed the clergy and choir stalls, which were a special gift. I took the whole of contracts for the restoration of the buildings and nave seats of pitch pine.

Messrs. Demaine and Brierly, of York, were architects.—I am, &c., T. Woolston.

Recreation-road, Stamford, Dec. 7.

Mr. Messant, Newcastle, who was employed by the Aberdeen Harbour Board to report on the defects in the new graving dock, has confirmed the theory of the harbour engineer that the action of sea water on the concrete has been the cause of the damage, to make good which he estimates that nearly £3,000 will be required.

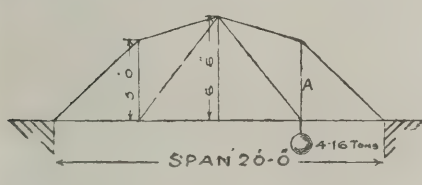
Intercommunication.

QUESTIONS.

[9493.]—**Geology and Chemistry of Building Materials.**—Can some reader kindly inform me what is the reliable but not too elaborate work on the above subject?—Q. A. G.

[9494.]—**Hot Water Pipes.**—How can I calculate the size of boiler and length of 4in. pipes required to heat a church containing 300,000 cubic feet? A simple rule for all cases would oblige.—PACK.

[9495.]—**Water Supply.**—Would any of your readers kindly tell me what works on water supplies to towns a student might get and supply?—AM.



[9496.]—**The Albert Memorial.**—1. Has the gilding of the Albert Memorial been done with gold leaf? 2. Has anything been applied to protect the gilding against the influence of the weather? 3. Has the gilding required renewing up till now? 4. Which firm has contracted for the gilding?—J. GRIGENHEIM.

[9497.]—**Noiseless Outlet Ventilator.**—Can anyone recommend an efficient and noiseless ventilator for fixing to an air-flue from rooms? Those with mica flaps are objected to on account of the disagreeable noise they make.—NOISE.

[9498.]—**Pressure on Wall.**—What wind-pressure in pounds per square foot will a common brick wall withstand, 14ft. in height and 9in. thick, built in common mortar? For the purposes of calculation the cohesion of the mortar may be left out. Supposing the wind-pressure to be 40lb. per square foot, what thickness should the wall be?—X. Y.

[9499.]—**Concrete Floor.**—I have to make a building three stories in height fireproof. The floors at present are of wood. The length of building is 60ft., divided into six bays, 10ft. centre to centre; the width is 36ft., divided into three bays, 12ft. each, with two columns. I have to take away all the wood flooring and beams, and put in girders in place of beams. I propose to put small girders from end to end 6ft. apart, and put the floor 5in. thick of the best concrete that can be made. Will some reader who has had experience say the proportion to be used of broken brick and cement? Also, is it necessary to allow for expansion? I shall have to cut into the walls about 2in. for it to take a bearing. It is not a question of saving a ton of cement, or any trouble. There are so many "patent" concrete paviors about—one says this, another that—one does not know which to accept, so have decided to do it myself.—ANGLO-SAX.

[9500.]—**Strains in Truss.**—I should feel obliged

if someone would give a stress diagram for the above truss, due to the single weight of 4·16 tons at bottom? I should also like to know what it is that causes the compressive strain which is evidently acting in the vertical, A.—EDWARD BAYLEY.

REPLIES.

[9466.]—**Early Churches.**—If "Student" will get "An Essay on the History of English Church Architecture," by G. G. Scott, F.S.A., 1881, he will find in it a great deal of most valuable information about the early churches of Great Britain, with plans of several, including, I think, some of those mentioned in my former reply.—A. C. W.

[9471.]—**Music Hall.**—"A. C. W." has led your readers astray by his reference to an article on the construction of and regulations for music-halls. It is always better to quote by the week and year of issue, than by the page and volume. "A. C. W." refers us to the BUILDING NEWS, Vol. XXVI. p. 528, whereas it should have been the same page in Vol. XXXVI., the issue of May 16, 1879. The regulations for insuring the safety of audiences in music halls, adopted by the magistrates for Kent, were published in the BUILDING NEWS of Sept. 16, 1881.—E. W. H. P.

[9474.]—**Ordnance Maps.**—The following abbreviations are found on a 6in. Ordnance sheet, viz., the triangle with a dot is a trigonometrical station and the numerals signify the level, taken on the surface, given in feet decimally:—C R, centre of river for parish boundaries, &c.; Bolt, an iron nail driven into pitching or steining, serving as a "trig." station; G P, guide post; M S, mile stone. B S, boundary stone (parish, municipal, &c.); C. Tk. d., centre track of ditch; F W, face of wall for boundary; C S, centre of stream; C D, centre of ditch; B B, bottom of bank; 3ft. R H, 3ft. from root of hedge; S. P., side of pond; F P, footpath; ⊙ Pkt., picket (peg) with level taken on it; W, well; △, trigonometrical station; M H, man hole to sewers, reservoir, &c.; L K, lime-kiln; P O, post office; P, pump; B H, beer house; P H, public house; F. Br., foot-bridge; S P, signal post; M P, mesh post for barges, &c., to make fast. These are from a 6in. sheet that is by me, though I must admit there are many other abbreviations, no doubt. Could "P." give me the solution of the following in reference to boundaries, viz., "Def." and "Und."? I am well acquainted with the field-work of the 25in. sheets (of which the 6in. are reductions); but the draughtsmen in the office cut things down to a nicety, so much so that the public are quite lost for an explanation. I trust the information herein contained will throw a little light on the subject, and that "P." will communicate with me in the event of any further elucidation.—EDWIN S. PAYTON, R.E. Dept.

[9479.]—**Ecclesiastical Architecture.**—I should recommend "Alpha" to read Rev. Mr. Walcott's "Church and Conventual Arrangements." One of the peculiarities found in Benedictine Abbey churches is the separation provided between the choir and parishioners part of church or nave. The choir was often under the central tower, and was extended westwards. Sherborne Abbey and St. Alban's exhibit this distinction.—G. H. G.

[9479.]—**Ecclesiastical Architecture.**—Consult Dugdale's "Monasticon Anglicanum," Fosbrooke's "British Monachism," and Helyot's "Dictionnaire des Ordres Religieux." Benedictines, or Black Monks were founded by S. Benedict at Monte Casino, A.D. 530. They held all the cathedrals of the "new foundation," in England except Carlisle. The churches of Tewkesbury, Battle, Pershore, Selby, Glastonbury, Tynemouth, Croyland, and many others also belonged to them. Their monastic buildings included workshops of every trade and a mill, in order to render them quite independent of the outer world. Fergusson, in his "History of Architecture," says—"In the library of the monastery of St. Gall, in Switzerland, a plan of a great monastic establishment was found by Mabillon in the 17th century, and published by him in his 'Annals of the Benedictine Order.'" This plan does not pretend to represent any particular establishment, but is a "projet" of what was then considered a perfect monastery. It is, in fact, an illustration of the Benedictine system as applicable to Germany in the 9th century in its completed and most perfect form, and on this account is far more interesting to us than if it had been merely a plan of any particular monastery." The plan is given in Vol. II. of the above history, and also in the R.I.B.A. *Transactions*, Vol. III. new series.—A. C. W.

[9480.]—**Masonry and Stonecutting.**—I am very much obliged to Mr. John Powell for suggesting emendations to the text of my lessons, which he thinks will make them more in harmony with the usual terms used by practical masons in England, and before I publish the lessons as a textbook I should like to see them thoroughly revised by Mr. Powell and other practical masons. As to Mr. Powell's objections to the word "voussoir," I have some difficulty in making out wherein they lie. The question is simply this: *Is a cupola to be called an arch?* Until I hear that this is the proper way of defining a cupola, I beg to keep the word *voussoir* as being more convenient than the term arch-stone. As to the methods of stone-cutting discussed by Mr. Powell; the *first* was given by the Professor of the Ecole des Beaux Arts and the Military Polytechnic School of Paris, probably because it expresses the geometrical formation of the prism better than the other; but, as I have some experience in practical masonry, I naturally rejected that method as unpractical when teaching my pupils to work the stone. The reason why I inserted that method in my text is explained by my object in initiating my lessons of masonry. I beg to say that, when I proposed by lessons, I had no intention of teaching workmen the processes of stone-cutting; my ideas were limited to teaching *architectural students* the *geometrical methods* of masonry. The geometrical operations, by which the moulds for stone-cutting are prepared, are the same which the carpenter, the joiner, and the plumber use in preparing their working drawings; the science of masonry has, therefore, been in past times, and still ought to be the *foundation of architectural education*. It should be to the architect and to all craftsmen as familiar as the four rules of arithmetic. Although my class of masonry was intended for architectural students, it happens that several practical masons applied to join. At the present time, practical masons and architectural students are working side by side in my class. I was, at first, afraid that the kind of lessons I was giving to architectural students would hardly suit the requirements of the practical masons; but now I have found that the practical masons show an even greater interest in my lessons than the young architects. One of them, a master mason, assured me in my last lesson, Monday, 29th Nov., that there was hardly a mason in England who could prepare the moulds for stone-cutting as I do. He added that he has been for years trying in vain all kinds of places to learn, and that if I would only open a class for practical masons I should find hundreds would join. For what I know of masonry I am indebted to the hospitality offered me in Paris by the *Ancient Guild of Practical Masons*, and, therefore, I feel in duty bound to extend a brotherly hand to all practical masons who wish to learn. A class for *practical masons only* shall be initiated, to be instructed by practical masons as well as myself. Before ending these observations, I beg my young colleagues, the architectural students, to ponder what this last move means for them. They know that our grand cathedrals and abbeys were entirely designed by practical masons, and I can give them a quite modern instance of a practical mason becoming the leading architect of his day. About forty years ago a mason named Simon, of St. Gall, was working in St. Petersburg. A cupola was being built, and in the dinner-hour, as Simon was partaking of some bread and cheese in the masons' yard, he said to his pals that when the centring was knocked off they would do well to clear out of the place, for the cupola was sure to come tumbling down. This conversation was overheard by the brother of the Czar, who was visiting the works unawares. When the centring was removed the cupola did tumble down, and Simon was summoned before the Czar to explain the cause of the accident. The Czar was so struck by the intelligence of his answers that he confided to him the rebuilding of the cupola. Simon made from that moment a rapid fortune as an architect, and came back a wealthy man to his native place, St. Gall, where he died but lately. I know also other instances of masons, still living, becoming prosperous architects. Now, if the practical masons of England take to learning so eagerly as they seem to be inclined to do, is it not possible that they may become the architects of the future, and shove out of the field the gentlemen architects with kid gloves? The moral of these reflections is obvious. If the architectural students wish to hold their own later as architects, they must set to work seriously, and embrace every opportunity of learning which is offered them.—LAWRENCE HARVEY, Architect. (Teacher of the Class of Masonry, City and Guilds of London Institute).

[9482.]—**Products of Gas Combustion.**—The result of combustion by the atmospheric or "Bunsen" flame is shown by the following chemical equation, $CH_4 + 2O_2 = CO_2 + 2H_2O$; that is, one molecule of carburetted hydrogen, or common coal-gas, combining with two molecules of oxygen gives one molecule of carbonic acid, or carbon dioxide, and two molecules of water. With the illuminating flame you have a less supply of oxygen, and therefore have the following reaction—$CH_4 + O_2 = 2H_2O + C$; in the latter case the chemical action heats the free carbon to white heat, giving forth light, but which on coming to the surface of the flame combines with the oxygen of the air, forming CO_2, or possibly escaping altogether a free carbon or soot. By the above explanation it will be seen that carbonic acid is the result of both flames. Carbonic oxide, CO, is by far the most poisonous.—SCIENCE.

[9484.]—**Chesterfield Spire.**—I am able to give "G. C." some reliable information respecting this curious spire. It was my privilege to be acquainted with the late Mr. John Dixon, chief engineer of the Stockton and Darlington (the first) Railway, the first pupil of the celebrated George Stephenson. In conversation with him upon some timber construction, he intimated that he believed timber shrank endwise, and related the fact that when a young man he went with Mr. Stephenson to examine the spire for the local authorities, some of whom were afraid it was unsafe. After a very careful examination, in which they discovered thoroughly good construction and very little imperfection, Mr. Stephenson decided from all the appearances that some of the timbers had shrunk endwise, and being thoroughly secured and unable to move otherwise, the framework twisted. He was of opinion that it would go no further, and was perfectly safe. It looks more twisted from some points than others.—W. PEACHEY, F.R.I.B.A.

[9485.]—**Old Irish Fonts.**—If by this query is meant the old block basins in Brash's "Ecclesiastical Architecture of Ireland," we read that one of these rock-basins lies outside the church at Inniscultra, in Lough Derg; and others exist at Glendalough, Kilternan, and at the Well of St. Abban, at Ballyvourney. At Ballymeanig, Kilmalkedar, Fore Chapel, Faithlegg, Ballybacon, Killeshin, and other places are early fonts of Norman type. There is an early font in St. Canice's Cathedral, Kilkenny, that formerly belonged to Kells church in the same county.—HARRY HEMS.

[9485.]—**Ancient Irish Fonts.**—A few examples worth notice may be found, but in churches of Anglo-Norman origin at St. Davius, Naas (part a restoration), St. Andrew's, Dublin, Cathedral of St. Canice, Kilkenny, and some of similar pattern at St. Mary's, Kilkenny, and Gowran, Co. Kilkenny. Also a good font at Nicholas, Galway (Hiberno-Spanish). I have sketches of most of these.—J. DREW, Dublin.

[9486.]—**Earl Strongbow.**—The reputed memorial to the celebrated Strongbow is a monument in polished Purbeck marble (I believe), with a recumbent representation of the grim warrior lying thereon. It stands on the south side of the nave of Christ Church Cathedral at Dublin, and by its side is a smaller one, in the same material, representing the head, shoulders, and body of someone else. Tradition says it records the death of Strongbow's eldest son, whom the warrior chopped in twain with his sword, for the exhibition of cowardice in battle. It is but fair, however, to the stern father to say doubts have been entertained as to his having really cut the youth in two. Some accounts affirm that Earl Strongbow *only* ran his son through the body with a long sword! I spent a very pleasant morning recently in Christ Church Cathedral, in the instructive company of Mr. Thomas Drew, R.H.A., of Dublin, the cathedral architect, and a well-known gentleman who has done much for the edifice since the death of the late Mr. G. E. Street, R.A. Strongbow's monument used to be a spot over which some curious customs as regards local leases took place. Furthur, on the top of his "nob" (I mean the champion's head), there is a deep hole, and measuring an inch or two in diameter. A laughable custom connected with this opening was practised for centuries amongst the choir boys, and was religiously performed down to the time of the restoration. Any new juvenile addition to the choir was on the first possible opportunity taken solemnly to Strongbow's tomb, and there, surrounded by sympathising comrades, was made to put his nose into this hole at the top of the sculptured warrior's head. Then the question was asked, "Can you smell gunpowder?" Of course, the reply came sooner or later in the negative, when instantly the unfortunate lad's head was banged with great force against the marble one, the evident idea for this being by thrusting his nose further into the hole, to give him a better idea of the emptiness of the gunpowder theory. The crypt beneath the cathedral is now in admirable order. Mr. Drew has made it at once a local museum of the highest possible interest, and a campo sancta. Numerous old monuments line the walls, and the archæological and antiquarian remains carefully classified and arranged at the eastern end are of the highest value. This crypt is of rough masonry, probably prepared by the Irish masons themselves, a superstructure upon which the builders, who, it is believed, came from Glastonbury, afterwards built the cathedral itself. The masonry in this crypt, at some time or other was kept from sinking by innumerable wooden wedges driven in at frequent intervals between the joints of the stone. The crypt itself was very damp until Mr. Drew had it drained thoroughly. The curious result of drying the place, however, is that this multitude of wedges are naturally shrinking through the non-existence of the damp surroundings they have been so long accustomed to, and are now, at every hand, tumbling out of their old cracks. It may be instructive to discover what stone was originally used at Christ Church. The late Mr. Street thought it was Caen stone, but I believe few accept that theory now. Mr. Drew, however, does not believe the material, whatever it is, to be an Irish one. Where did it come from, then?—HARRY HEMS.

[9489.]—**Billiard-Room Light.**—The mode of lighting up billiard tables, as suggested by "J. M. H." is not only not new but quite antiquated, we having in our experience come across one or two billiard lights of that kind. We think if he were to adopt or recommend our system of lighting billiard tables with oil lamps he would find that it scarcely causes any shading of the table. You will see the style of lamp we use on page 16 of our price-list, which we shall be glad to send any reader. The founts of these being crystal glass, what little shade the burner occasions is overpowered by the light emitted by

its fellows.—Hennig Bros., 29, High-street, Bloomsbury, W.C.

[9491.]—**Valuation.**—The ground-rent is deducted from valuations of leasehold property. In freehold, of course the value of land is included.—G. H. G.

[9492.] — **Architectural Perspective.** — The second grade perspective hardly is a course for the young architectural assistant. In architectural perspective, the general course is to work from the plan of the building, and this is explained in Nicholson's and Ware's treatises on "Perspective." A good introduction to it will be found at the end of Newland's "Carpenters' Assistant," and in a small work by Chapman, "Introduction to Ground Plan Perspective."—G. H. G.

[9492.] — **Architectural Perspective.** — A thorough knowledge of the principles of perspective is most certainly useful to the architectural draughtsman, a good way to obtain which is a course of study at a school of art, but a much more ready and "rule of thumb" method than that taught in the schools is in general use among them, the latter being a great deal too complicated for practical purposes. I, however, always use a modification of it which I worked out for myself, and which I find answer very well in practice, and is very much simpler. There are plenty of handbooks published on the subject, and if "Station Point" does not wish to go very deep into the matter, I should think any assistant would give him the required information in "one easy lesson."—A. C. W.

LEGAL INTELLIGENCE.

Charge Against a Builder. — Henry Collins, builder, has been committed for trial by the Southwark police magistrate on a charge of obtaining goods on credit from Messrs. Measures Bros. and Co., iron girder manufacturers, being at the time an undischarged bankrupt. The defendant had dealt with the prosecutors since 1885, always paying cash until February, 1886, when he ordered goods amounting to £47. The transactions were understood to be for cash, but the money was not forthcoming, and had never been paid, and the prosecutors, on making inquiries, found that he was an undischarged bankrupt since early in 1885, and still remained so.

In re T. Bush Sage.—The bankrupt, who traded as a builder in Elvin-avenue, Paddington, applied at the London Bankruptcy Court on Tuesday, to pass his examination on a statement of affairs which showed liabilities £5,048, with fully secured debts £25,458, and assets £5,351. The bankrupt passed.

CHIPS.

The adjudications in bankruptcy in Tuesday's *Gazette* include the names of Frederick Smith, Coleman-street, E.C., builder, and James Forster, Leeds, builder.

A free library is about to be built at Denton, Ashton-under-Lyne, from designs by Messrs. T. D. and J. Lindley, architects, of the latter town, selected in competition.

The Chancellor of the Exchequer, Mr. Goschen, laid, on Tuesday, the foundation-stone of the Church of the Holy Cross, situated in Cromer-street, Gray's Inn-road. The church is estimated to accommodate 600 or 700 persons, and built at a cost of £8,000.

At a meeting of the town council of Linlithgow, held on Monday, Mr. Russell Walker, architect, submitted plans of the proposed new town hall and municipal buildings. The council approved of Mr. Walker's plans and report, and instructions were given to get offers for the work, so that the buildings may be proceeded with at once. Mr. Peter M'Lagan, M.P., Provincial Grand Master, will lay the foundation-stone of the new hall.

The Duchess of Albany opened, on Tuesday, the new Public Hall and Leopold Institute which have been erected at Slough. The building contains lecture, reading, and friendly societies' rooms, the cost of the structure amounting to about £4,000.

M. Philippe Rousseau, the still-life and animal painter, died in Paris, on Monday, at the age of 70. He was a pupil of Gros and Bertin, and some of his subjects were taken from La Fontaine's "Fables."

A meeting of the committee and suscribers to the memorial proposed to be erected to the memory of the late John Elder, of Fairfield shipyard, near Glasgow, was held at Govan on Monday, when it was agreed that the memorial should take the form of a statue to be placed in Elder Park, and that the work should be placed in the hands of Mr. E. J. Boehm, R.A. The cost will be 2,000 guineas, of which 1,700 guineas has been collected.

Mr. Thomas M. Lockwood, F.R.I.B.A., delivered a lecture at the Grosvenor Museum, Chester, last week on "The Architecture and Costume of the Fourteenth Century."

St. Andrew's Church, Pershore, was recpened by the Bishop of Worcester on Wednesday week after partial restoration, including the fitting of the chancel with choir-stalls.

STATUES, MEMORIALS, &c.

The New Wellington Statue. — The Prince of Wales, as president of the committee appointed two years ago to erect a new statue to the Duke of Wellington at Hyde Park Corner, which is to be called Wellington-place, has formally sanctioned the designs for the work which have been executed by Mr. Boehm, R.A., who modelled the statue, and by Mr. Taylor, of the Office of Works, who has drawn out the plans of the pedestal and the basement. The statue, like the old one now removed to Aldershot, is equestrian, and will be cast at Chelsea. It will stand directly opposite and face the centre of Apsley House. The pedestal will be placed upon a raised platform, 2ft. or 3ft. above the footway of Piccadilly, and will be surrounded by a margin of grey and red granite. The platform, 50ft. by 45ft., will be filled in with ornamental paving, and will also have a margin of granite. Steps of granite will run from this to what is at present a grass-plot; but which it is intended shall be asphalted. Around the outer edge trees will be planted.

WATER SUPPLY AND SANITARY MATTERS.

Wednesbury.—A special meeting of the Wednesbury Corporation was held at the sewage outfall works, Bescot, on Tuesday, for the purpose of inspecting the arrangements and seeing the machinery in motion. Mr. E. Pritchard, consulting engineer, explained the arrangement of the works, and the purification of the sewage. Gas having been generated by means of Dowson's economic gas system, two Otto's silent gas-engines in the engine-house were set in motion, Mr. Holt, Messrs. Crossley's representative, explaining the principles upon which they worked. The fact was commented upon that this was the introduction of the Dowson gas system into the district. Reference was also made to the experimental character of some of the processes and appliances. The system adopted is a partially separate one, the sewers containing sewage only, and the surface water passing along the open paved channels which the town possesses to the water-courses. The estimate is that 625,000 gallons (exclusive of surface or infiltration water) of sewage will be emptied into a brick chamber at the outfall where all floating matters will be removed, and the sewage will be treated in tanks (there being eight, each of 50,000 gallons capacity), with milk of lime, sulphate of alumina, and, if thought desirable, with proto-sulphate of iron also; and the effluent will then be conveyed to the land—an area of about twelve acres, laid out in level beds as filters—and from the land be discharged into the Tame. The sludge in the tanks will be compressed and prepared for removal to the orders of purchasers. The engine-house contains two 40-indicated horse-power Otto gas-engines, having direct-acting air compressors for the purpose of elevating the sewage, by means of Shone's ejectors from the low-level to the high-level sewers, and the engines also operate upon Westinghouse air compressors, and a vacuum pump for sludge pressing. In the pressing-room are two of Messrs. S. H. Johnson and Company's sludge filtering presses, each capable of pressing fifteen tons of sludge per day. These works will be fed by 27 miles of cast-iron and earthenware sewers, varying from 24in. to 9in. diameter, which are laid at different depths below the surface of the ground from 7ft. to 27ft. 3in., Shone's pneumatic ejectors having been placed at the low levels of the town. The Patent Shaft and Axletree Company has supplied the cast-iron pipes and special castings; and the Glenfield Company, Kilmarnock, the gas-engines, compressing engines, and machinery generally; whilst the construction of the sewers, the preparation of the outfall land, and the general work has been done by Mr. G. Law, Kidderminster and Wednesbury. The total amount of the loans for sewerage purposes is £45,000. The resident engineer has been Mr. C. Richards, Coventry, acting under the personal direction of the engineer, Mr. E. Pritchard, and his assistant, Mr. Fairlie.

The Vyrnwy Water Supply for Liverpool.—The quarterly return of the Water Committee of the Liverpool Corporation shows that the sum expended up to the 30th September last was £1,640,141 18s. 5d. Since the date of the last return the following contracts have been entered into:—Glenfield Company, Limited, Kilmarnock, valves, £200; Messrs. Cochrane and Co., Dudley, pipes for straining tower, £250; Glenfield Company, Limited, Kilmarnock, stand-pipes and three 30in. stopcocks, £170; Messrs. Cochrane and Co., Dudley, pipes for waste water course, Parc Uchaf, £1,500; Messrs. Clay and Sons, Ellesmere, iron centering for straining tower, £150.

An oak lectern, the work of Messrs. Cox, Son, and Buckley, has been placed in Christ Church, St. Alban's, as a memorial of the late vicar.

Our Office Table.

Professor T. Hayter Lewis, F.S.A., who has just returned from a visit to Constantinople, has written a letter to the Chairman of the Palestine Exploration Fund with reference to the sarcophagi recently found at Sidon, now at Constantinople, of which he was allowed by the Director of the Imperial Museum, Hamdi Bey, to see photographs. These sarcophagi, 10 in number, were found in churches 50ft. below the present surface of the ground; three are Phœnician in character, and the other seven of Greek design of different periods, carved out of Greek marble blocks. The architectural details of the latter seven sarcophagi are of the Greek type of the best period, without a trace of Roman influence, and the sculpture appears to be of the highest class. It is altogether different from the bold style of the Pergamos sculpture, and much more nearly resembles the beautifully delicate carving of the Parthenon frieze, of which the horses, the figures, and the drapery of the Sidon monument strongly remind one. All these Greek sarcophagi show large remains of coloured decoration, and confirm Hittorff's theories as to Greek polychromy as given in his work on Sicily. It will be months before the sarcophagi can be seen by anyone, as it is considered that it would be highly dangerous to expose them, however slightly, to the dust and damp of a Constantinople winter, as would be the case if they were uncovered before being placed in the building now being erected for their reception. The greatest care seems to have been taken to preserve the colouring and carvings from injury during their removal from Sidon.

Mr. Louis Samuel, the eldest son of the Agent-General for New South Wales, died at Sydney on the 29th ult., at the age of 26 years. He was educated as a civil engineer in the office of Mr. Moriarty, the Engineer-in-Chief to the Government of New South Wales, and seven years ago accompanied his father, Sir Saul Samuel, to England, where he studied for two years. He was engaged on important pier works at Tynemouth, and subsequently enlarged his experience of railway construction on the Lynn to Norwich line of the Eastern and Midlands Railway. On returning to New South Wales, about five years ago, though only 22 years of age, he tendered successfully to the Government for the construction of the largest graving dock in the Southern Hemisphere, at Biloeela, or Cockatoo Island, in Sydney Harbour. He was on the eve of completing this important work, successfully and unaided, when a career of high professional promise was abruptly ended. He had also undertaken other contracts of some magnitude.

The two national galleries at Edinburgh were opened on the 1st inst., after being closed throughout November for the annual overhaul, and contain several additions. Three works have been added to the collection at the National Gallery of Scotland—a large picture by the late Sam Bough, R.S.A., of a "Royal Volunteer Review," held before the Queen at Edinburgh a quarter of a century since, a gift by Mr. C. T. Combe; "Paralelsus, the Alchemist Lecturer," by the late David Scott, R.A., a loan; and "Cottar's Children," by Andrew Somerville. The additions to the Scottish National Portrait Gallery include the artist, P. Taylor's, portrait of himself, which is hung next his portrait of Burns; Mrs. Siddons, by John Wood; Patrick Fraser Tytler, the historian, by Sir John Watson Gordon; Thomas Thomson, the lawyer and antiquary; and a portrait by John Moir of Alexander, fourth Duke of Gordon; The Lord President presented to the Gallery a portrait by an unknown artist of his father, the Rev. John Inglis, D.D., of Tibbermuir, Perthshire, and Old Greyfriars, and for many years was the acknowledged leader of the "moderate" party in the church. Other works are a water-colour miniature on ivory of Samuel Halkett, the linguist, by C. Halkett, a sketch of William Dyce, R.A., from the pencil of David Scott, R.S.A., and several medallions of men of note.

We have received a "combination set-square," which has been invented by Mr. W. H. Dashwood Caple, a Cardiff architect, for the use of his fellow-practitioners and draughts-

men. Its object is to comprise in one set-square the advantages of two, giving the usual angles of 60° and 45°, thus rendering two separate squares unnecessary. The specimen sent us is in pear wood, rather too thick for comfortable use, and certainly too heavy for delicate work. Some architects may like the "combination"; but our main objection to it is that although the square itself gives a right angle of 9in. by 7in., the 45° and 60° are restricted to 5½in.; thus, while the instrument is of a really large size, it is only equal to two small set-squares, which would be far more easily carried—either in a case or the pocket.

Electric lighting *versus* gas-lighting was discussed at a recent meeting of the Manchester Association of Engineers, when Mr. J. R. Williamson read a paper on electric lighting from central stations. In reply to questions raised as to the results obtained in the application of electric lighting to mills and works, and the comparative cost of gas and electricity, Mr. Williamson replied that in the immediate vicinity of Manchester there were a score or more mills where the electric light was working successfully, and as to the comparative cost of gas and electricity, he pointed out that in one large mill, where lighting by gas had been replaced by 930 electric lamps, the cost over a certain period had been £362 for maintaining the electric lamps, as compared with £510 which had previously been paid for gas at the rate of 3s. 2d. per 1,000ft.

A new and attractive loan collection has been opened at the Municipal Art Gallery, Birmingham. Among the more popular works are Landseer's "Midsummer Night's Dream" and "The Sick Monkey"; Sir Frederic Leighton's "Hercules Wrestling with Death for the Body of Alcestus"; three works by Mr. Burne-Jones—"The Annunciation," "The Feast of Peleus," and "The Wheel of Fortune"; Holman Hunt's "Shadow of the Cross"; "The Last Muster," by Herbert Herkomer; Walter Crane's "Bridge of Life"; and Professor Richmond's colossal "Prometheus." Since the gallery was opened, just two years ago, two millions of people have visited it.

During the present week photographs have been on view at the Mansion House of Count I. de Lalaing's design for the Waterloo Memorial, which is about to be erected in the new cemetery at Evere, near Brussels, to the memory of the British officers and men who fell in the Waterloo campaign, and were buried in Belgium. Till now the tombs of these heroes have been utterly neglected, and many of them were simply interred in the farms round Mont St. Jean. A good site has been given by the municipality of Brussels, and the British Government have promised £500 to the cost of the monument, which is estimated at £2,000. The sculptor's composition comprises the mourning figure of Britannia, with her trident turned down pointing to the inscription on the rough slabs, at the head of which she stands erect, shield in hand, but with downcast head at the memory of a nation's loss. Four full-length lions are watching in crouching attitudes round the sepulchre, while here and there are ghastly memorials of the battlefield. The design is original in treatment, though it hardly records a victor's sorrow, and seems spoilt by a lack of vigour.

Sir Douglas Galton read a paper on "The Cause and Prevention of Smoke and Fog" at the Parkes Museum on the 1st inst. The lecturer said that black fog was entirely the result of smoke, and if each person would make his own individual efforts, light and air would cease to be obscured. Ammonia and sulphur were present in London air to a great and unnecessary extent. If we emptied our dustbins more frequently, and if we cleaned our streets properly instead of allowing such a quantity of horse manure to lie about, we should diminish one potent cause of fog. The blackness of the fog came from the smoke arising from incompletely burned coal. Fires and boilers were quite easily made smokeless either by proper care or mechanical stokers; but domestic fires caused most of the foul smoke, and the evil daily increased with the growth of the population. If the smoke nuisance was to be abolished, gas must in the first place be used for cooking. There were plenty of so-called smoke-preventing open fires; but they required care in putting on coals, and nobody exercised that care. All experience showed that open fires must be abolished. If smoke was to be avoided houses must be warmed by hot-air, hot water, steam, or gas.

An artists' exhibition was opened on Monday in the Art Gallery, Schoolhill, Aberdeen. The canvases hung number 500. Local artists are stronger in portraiture than usual, some of the more conspicuous being those by Joseph Farquharson, J. C. Mitchie, and W. Cadenhead, and the display of water-colours is the strongest yet seen in Aberdeen. Among the landscapes may be mentioned those by Alexander Mackenzie, "On the Coast of France," T. Bantry's "Findhorn" and "Lochnager from Calleen," and sketches from Tangiers by W. Guthrie. The *genre* pictures include works by W. B. Baird, Sam Reid, and Josef Israels; and the chief contributors of sculpture are Boehm, D. W. Stevenson, and T. Stuart Burnett.

The second annual meeting of the shareholders in Robert Boyle and Son, Limited, was held on November 23rd, when a dividend of 12 per cent. for the year was declared on the ordinary shares of the company, free of income-tax, one-sixth of the profits being also placed to the reserve fund, and a substantial balance carried forward to next year. Mr. Robert Boyle, the managing director, stated that there was a highly satisfactory increase in the business, which he attributed to not only the improved form of the air-pump ventilator they were now making, but to the fact that they had also tried as much as possible to meet the requirements of their clients with regard to cost and the quality of the articles supplied, the present form of the air-pump ventilator, though much more efficient, being now sold at about 50 per cent. less than previous and inferior forms, besides being made of a more ornamental character.

The experiment of giving short courses of lectures, free, in large halls in London, which is being tried this term under the auspices of the London Society for the Extension of University Teaching and the Gilchrist Trustees, is proving a marked success. Courses have been arranged in ten different districts in London, and halls as large as the Town Halls of Shoreditch and Bermondsey, holding from 1,500 to 2,000 people, have been full to overflowing. These lectures, which in the majority of cases are upon scientific subjects, are illustrated by the oxy-hydrogen lantern and experiments.

CHIPS.

The December issue of *Science and Art* contains an excellent portrait and a biography of Mr. Henry Adams, M.Inst.C.E., M.S.A., professor of engineering at the City of London College.

Sir William Fettes Douglas, P.R.S.A., distributed the prizes to the students attending the Life School of the Royal Scottish Academy on Friday, and delivered an address. The Chalmers Bursary was obtained by Mr. John Briggs and Mr. W. Marshall—equal. The prize for the best drawing from the life was given to Mr. David Noble; second prize, Mr. Alexander Hay. The Keith prize for the best work of a student in this year's Exhibition, Messrs. Duddingston Herman and William Fraser—equal. Maclaine Watters medal and extra prize, Mr. W. Milne; and Stuart prize, Mr. G. Denholm Armour.

A new hospital was opened on Tuesday at Ruabon, which has been built and furnished by Sir Watkin Williams Wynn, Bart., of Wynnstay. It has been constructed by Mr. Samuel, contractor, Wrexham, frem the design of Mr. Spaull, architect, Oswestry, at a cost of £2,500.

A school chapel at Murchington, near Chagford, designed by Mr. James Crocker, of Exeter, a resident in the parish, is in course of erection. The foundation-stone was formally laid last week.

The new (Halicarnassian) picture gallery, which Messrs. Charles Hallé and Comyns Carr are about to erect as a competitor for the class of exhibitions hitherto held in the Grosvenor Gallery, is to be built on a prominent site, we hear, in Piccadilly, and Mr. E. R. Robson, F.S.A., is to be the architect.

The Church of Holy Cross, Shrewsbury, built from plans by Mr. J. L. Pearson, R.A., on the site of an old church long in ruins, was consecrated on Monday. The work has cost £10,000.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Leeds and Yorkshire Architectural Society. Annual Dinner.

Tuesday.—Society of Architects. 'The Relations of Architect, Surveyor, and Builder," by J. Leaning, St. James's Hall, Piccadilly. 7 p.m.

Institution of Civil Engineers. Discussion on "Electrical Tramways." 8 p.m.

Birmingham Architectural Association. "The Temples, Theatres, and Tombs of Pompeii," by W. Wallis.

Sheffield Society of Architects and Surveyors. "Registration," by J. W. Connon, of Leeds.

Manchester Architectural Association. "Scottish Cathedrals," by the Rev. R. H. Snape, of Bolton.

Wednesday.—Society of Arts. "Commercial Education," by Sir Philip Magnus. 8 p.m.

Friday.—Architectural Association. "The Proposal to Make Architecture a Close Profession by Imposing the Test of Examination and Registration," by T. G. Jackson, M.A. 7.30 p.m.

Institution of Civil Engineers. "River-Gauging at the Vyrnwy Reservoir," by J. H. Parkin. 7.30 p.m.

Edinburgh Architectural Association. Annual Dinner.

Architectural Association.—"The Proposal to Make Architecture a Close Profession by Imposing the Test of Examination and Registration." By T. G. Jackson, Esq., M.A. 7.30 p.m. Dec. 16.

ARCHITECTS', ENGINEERS', AND SURVEYORS' REGISTRATION BILL.

The ARCHITECTS' and ENGINEERS' REGISTRATION ACT COMMITTEE invite all who are interested in the Passing of the above Bill to CONTRIBUTE towards the NECESSARY EXPENSES incidental to the presentation of the Bill to Parliament.

If this appeal is met with a ready response by the profession, the Bill will be presented to Parliament early next session by

COLONEL DUNCAN, R.A., C.B., M.P.,

who has kindly undertaken to pilot the Bill through the House, backed by other influential members.

Subscriptions of all amounts will be acceptable, and all sums of £1 or upwards will be publicly acknowledged, and subscribers will be supplied with a Copy of the Bill.

Subscriptions may be sent to the Honorary Secretary,

EDGAR FARMAN, Hon. Sec.

J. WATSON MOYSES, B.L.,
ROBERT WALKER, M.S.A., A.M.I.C.E.,
HUGH ROUMIEU GOUGH, M.S.A., F.R.I.B.A., } Treasurers.

39, King-street, Cheapside, London, E.C.

The award of the gold medals and other prizes this year at the Royal Academy will take place on Saturday next, and the public will be admitted to view the students' works on Monday during the daytime.

The Metropolitan Board of Works have resolved that no surplus land other than that which has been let on lease should be sold until it shall have been in the first instance submitted to public auction.

Among the lectures to be given next year at the Royal Institute of Great Britain are three by Prof. Herkomer, A.R.A. These will be delivered on Thursday, Jan. 19 and 26, and Feb. 2, and will deal with the subjects "The Walker School," "My Visit to America," and "Art Education."

Garside's Noted Bedfordshire Coarse and FINE SILVER SAND.—Is perfectly free from impurity, and the best and cheapest in the market. All qualities in stock, for every purpose required in the building trade, for filtration, or for nursery purposes. All pure grit!—Apply to GEORGE GARSIDE, Junr., Leighton Buzzard.

Holloway's Ointment and Pills are infallible for curing bad legs, varicose veins, swelled ankles, erysipelas, scaly skin, and every variety of skin disease. Over all disorders Holloway's remedies exert a quick and favourable action, and where cure is possible gradually but certainly arrive at that consummation. They are invaluable in the cure of scrofula and scurvy.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

BEST BATH STONE.
CORSHAM DOWN } **SUMMER DRIED**
FARLEIGH DOWN }

BOX GROUND, COMBE DOWN, WESTWOOD GROUND.

RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN.
BOX GROUND. FARLEIGH DOWN.
COMBE DOWN. STOKE GROUND.
WINSLEY GROUND. WESTWOOD.
PICTOR and SONS, BOX, WILTS.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

APPLETHWAITE.—For new boys' school, St. Marys Applethwaite. Mr. R. Walker, Windermere, architect and surveyor:—

(Accepted tenders)
Mason work, walling, &c.:—
Atkinson, T. and M., Windermere.
Carpenters and joiners:—
Longmire and Robinson, Windermere.
Plumber:—
Pattinson, J. A., Windermere.
Plasterer:—
Pattinson, G. H., Bowness.
Painter and glazier:—
Heaton, R., Windermere.

CAMBERWELL.—For the erection of proposed parish hall, Camberwell, S.E. Mr. G. Hubbard, 23, Finsbury-circus, E.C., architect. Quantities by Mr. J. Sargeant, Grosvenor-gardens, S.W.:—

Patman and Co.	£3,543 0 0
Baalam Bros.	3,085 0 0
Holliday and Greenwood	3,077 0 0
Chappell, J. T.	2,964 0 0
Braid, A. and E. (accepted) ...	2,745 0 0

CHEDDAR.—For the restoration of the ancient Market Cross, Cheddar, Somerset. Messrs. Lingen Barker and Cross, architects:—

Accepted tenders:—
Mason:—Ford, Cheddar.
Carpenter:—Scourse, Cheddar.
Ironwork:—Spratt, Cheddar.
Plumber:—Shore, Cheddar.

DARTFORD, KENT.—For repairs and improvements to 12 cottages at Stone. Mr. St. Pierre Harris, A.R.I.B.A., 1, Basinghall-street, E.C., and Orpington, architect and surveyor:—

Hodges	£425 0 0
Gilham, R. W.	350 0 0
Knight	320 0 0
Hewitt (accepted)	289 0 0

ENFIELD.—For constructing roads and sewers at Little Park Estate, for Mr. A. Dixon:—
Jackson, J., Enfield (accepted).

ENFIELD.—For making up Gessolin-road, for the Enfield Local Board of Health. Mr. W. Ketteringham, surveyor:—
Jackson, J., Enfield (accepted).

ENFIELD.—For constructing roads and sewers, for the Eastern Counties Estates Exchange, on their estate at Ponder's End:—

Pizzey	£447 0 0
Marshall	444 0 0
Catley	438 0 0
Nicholls	435 0 0
Potter	410 0 0
Trueman...	399 0 0
Bell	398 0 0
Bloomfield	395 0 0
Jackson, J., Enfield	312 0 0

FENTON, STAFFS.—For the erection of a governor house at the gasworks, for the local board:—

Yoxhall and Heath (accepted) ...	£50 0 0

GLASGOW.—For the erection of a hydraulic elevator to the council chamber at the Municipal Buildings, for the city council. Mr. W. Young, London and Glasgow, architect:—

American Elevator Co. (accepted)...	£700 0 0

HARROW WEALD.—For house, Bentley Priory, Harrow, Middlesex, for the Rt. Hon. R. L. Powell. Mr. J. F. Curwen, Kendal, Cumberland, architect. Quantities by Mr. J. Sargeant, Grosvenor-gardens, S.W.:—

Staines and Son	£4 341 0 0
Kirby	4,290 0 0
Miskin, C.	4,164 0 0
Bentley, J.	4,156 0 0
Waterman, G. and J.	4,069 0 0
Larter, F.	3,986 6 0
Turner and Co.	3,747 0 0
Hanson, A. and B.	3,722 0 0
Holliday and Co.	3,698 0 0
Chappell, J. T. (accepted)... ...	3,669 0 0
Braid, A. and E.	3,665 0 0

For stables to above:—

Chappell, J. T. (accepted)... ...	1,200 0 0

(No competition.)

HACKNEY.—For laying down new block flooring in the infants' department of the Wilmot-street School, Hackney, for the London School Board:—

Duffy, M. C., and Son...	£637 13 0
Bendon, T.	550 0 0
Spencer, E., and Co.	530 0 0
Wood Block Flooring Co.	438 10 0
Chappell, J. T....	406 0 0
Frankenberg and Co., Kennington Park-road (accepted)	325 0 0

To Municipal Authorities, Engineers, and Surveyors.

JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market. *Prices and particulars can be obtained from*

GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,
And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

WORK ALL NIGHT,

OR ON DARK DAYS, WITHOUT GAS.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1719.
FRIDAY, DECEMBER 16, 1887.

BUILDING CODES AND COVENANTS.

THE rapid filling up of areas in towns renders necessary the control of some authority for the public benefit. A hundred years ago it did not matter much how a man built: the spaces for building were large, the rights of light and other easements were not so likely to be interfered with or invaded, lofty buildings were unnecessary because land was cheap and plentiful, bad drainage did not affect a closely-packed block of houses; and although there were reeking cesspools and polluted ditches, the great oxygeniser, air, was abundant and pure. Certainly London and many of our provincial cities were anything but models of cleanliness or wholesomeness, if we accept the accounts of historians and others—the streets were narrow and the houses crowded together; but two or three minutes' walk would bring the dweller into the country. This crowded condition of the old cities is to be explained partly by the want of good roads, and facilities of communication. They were so bad that the towns were condensed and huddled up within a small compass; only the wealthy had their conveyances. But a century ago the population was not a twentieth of what it is now, and, therefore, bad building and sanitation was limited to a few. Now a whole town or district may become infected through a system of drainage being imperfect, and hundreds in a dense neighbourhood may suffer from obstructed light or the erection of objectionable buildings or manufactories.

The Public Health Act enables any urban authority to come to terms with any person for the making of roads, which will become, on completion, maintainable by the inhabitants of the district; or to take over private streets when sewered, levelled, and metalled, by which powers the extension of our towns has been controlled. There is a code of Model By-laws which the Local Government Board have recommended for the use of local authorities, which have been adopted, with certain modifications, in most towns out of London; but it is silent on two very important points: the height to which a new building may be carried without inconvenience to adjoining properties, and the obstruction of light. Strange to say, that while there are rules to regulate thickness of walls up to 100ft., and rules for the maximum height of chimneys, there is no rule as to the permissible height to which new buildings—such as factories, shops, and warehouses can be carried in crowded neighbourhoods. The sections of the above Act which give power to urban authorities to regulate the line of buildings by setting them back to a general building frontage, has been highly beneficial; but there is certainly more required to prevent inconvenience and the invasion of the rights of adjoining property-holders by new building owners. Almost, if not quite, as much inconvenience may be experienced by a man building a house or a warehouse of twice the height of his neighbours' premises, as if he had built in front of his house. For example, a building owner erects a workshop or factory on his ground at the back of a house of four or five stories, obstructing the light of his neighbours, and blocking out their view. They may be in such a position that they cannot obtain any redress; they have not a prescriptive right of light as dominant owners, though the new premises may cause a material darkening of their rooms, besides a deprivation of sunlight in the gardens. In one instance of which we have knowledge, a large storehouse for wines and spirits was built at the rear of a private house in a country town, on the south side of the gardens of other houses in the street, the effect of which was to deprive the neighbours on the north side of sun and prospect, and to materially damage the value of the properties on that side. The gardens became damp and cold, and nothing would grow under the shadow of the building. Difficulty was experienced in letting the house nearest the huge blank wall, yet the owner and tenants had to suffer. There was no regulation to prevent the story from being carried up above a certain height, though four houses suffered by the act of one occupier. Corporations often let vacant land bordering new roads without any restrictions as to building upon it, greatly to the detriment of adjoining house owners and injury of their business, an instance of which we recorded the other day in an action by a company to obtain an injunction or recover damages against a building lessee of the Birmingham Corporation for shutting out their light by erecting a building twice the height of the older premises, which had also been let by the same authority. It was little solace to the disappointed owner of the overshadowed house to be told that he might have known lofty business premises would be built one day on the opposite corner. The same plea could be made use of on every occasion when a lofty house came to be built close to a lower one. The law only steps in when the older house can be shown to have an indefeasible right of light gained by prescription.

In these cases we have a strong reason for thinking that more use should be made of restrictive covenants where the law is defective. Why should the owner of small houses suffer by an adjoining owner erecting business premises that create considerable discomfort? A judge of the Chancery Division has power to inquire into any damage sustained by a person when the value of the houses injured is small; why should not a corporation have similar discretionary power to award compensation to the owner who has not quite acquired a right of light, but who has materially suffered from the erection of business premises of great height. If in letting land on lease for building, care was taken to insert properly worded restrictive covenants there would be less injustice committed by building owners. The vendor of land often does not see clearly his own interests, in the desire to let the estate, and only merely nominal restrictions are introduced in the agreement, such as that the buildings are to be erected of a certain value, that certain businesses or trades are not to be carried on, and that the lessee is to contribute towards the cost of road-making, &c. Vendors, however, often are the first to break faith with the lessees. They let adjoining land to tenants who carry on objectionable businesses, or they allow spaces that ought to have remained open, and under which idea the lessee had been induced to take land, to be built over, affecting prospect and light. A very common cause of complaint against the landowner is that after the best plots of land have been sold, he allows small and inferior houses or tenements to be built on adjoining land, thereby seriously injuring the property. Of course this injury "cuts both ways," but it always falls heavily on the lessee. With regard to the height of buildings, additions of bay windows and conservatories, and carrying on of trades, covenants are not inserted, and much injury is done to those who have taken lots. As illustrating the kind of questions that arise, and the liabilities of those who take land and have entered into covenants, a case of some importance came before Justices Cotton, Fry, and Lopes—an appeal by the plaintiff from the judgment of the Vice-Chancellor of the County Palatine of Lancaster. The plaintiff was owner, as tenant for life, of an estate at Broughton, and sought to enforce a covenant entered into by a predecessor of the defendant, which provided that no building upon the plot of ground in question should be used as a public-house. The defendant had notice of that covenant when he purchased the property. The Vice-Chancellor dismissed the action, on the ground that on other parts of the estate similar covenants had been waived by the plaintiff or his predecessor in title. In the deed of conveyance there was a covenant that the defendant would not erect a public-house or carry on the business of an innkeeper amongst others. A house was built, and an outdoor beer license was granted to it. The plaintiff pleaded that, of the eight fully-licensed houses on the estate, five of them were conveyed before 1847, before the tenant for life came into possession; another of the houses—the hotel—was sold without the insertion of any such restrictive covenant; and in every case the houses had been opened before the date of the assignment to the defendant, and not one had been opened since. Moreover, the plaintiff and his agents had constantly objected to any fully-licensed house being opened. The counsel submitted that in no point of view could one waiver of a particular covenant in a particular part of the estate be a waiver or release of the covenant as to another part. There had not been one fully-licensed publichouse opened since the defendant purchased. After hearing the other side, who contended that there had been a continuous breach of covenant since the date, by the establishment, of works, their lordships reversed the decision of the Vice-Chancellor, and granted an injunction restraining the defendants from using the premises as a publichouse, but not interfering with the defendant selling beer off the premises.

The case is of interest, as showing how scrupulously necessary it is on the part of landlords to allow of no relaxation by which a waiver may be established. In large estates, as this was, near Manchester, it was impossible always to maintain the same restrictions throughout. One part of the land may be of less value as a residential neighbourhood than others, and the restrictions as to certain businesses would not equally apply. The deed of conveyance is generally left to the lawyer; but the mode of securing the benefit of restrictive covenants is that persons who purchase land in plots should agree amongst themselves, and with the vendor, that they and all claiming under them respectively will observe and perform the covenants. A general deed to this effect, to be entered into by all the purchasers, is necessary, appended to which is the schedule of conditions and restrictions. Much uncertainty and unpleasantness would be obviated if owners of land were to sell or let only under these conditions.

PUBLIC ELEMENTARY SCHOOLS.

GOVERNMENT Departments have not a very enviable reputation amongst architects, and the official rules and Blue-books they issue relating to buildings requiring Government grants, or those over which they have a control, are scarcely ever received with favour. Those who have had to satisfy the requirements of the Ecclesiastical Commissioners, the Education Department, or the Local Government Board, have no very kindly feeling toward the dictation, sometimes arbitrary, and the "officialism," often wearisome, that characterise those departments of the public service. If the Government rules are still troublesome, and cause delay and hinder original suggestion, they are at least more concise and practical than they were. We have on our table the "Rules to be Observed

in Planning and Fitting up Public Elementary Schools," a Blue-book of a little over four pages, and which is published at threepence. Comparing it with the older forms, we find a general adherence to the requirements as to dimensions, though the new rules are thrown under headings and less open to misconception. To embarrass the architect with a large number of rules is often to defeat the object to be attained, and we therefore think it wise not to hamper the designer with too many dimensions. In planning any building a great deal must always be left to circumstances, and in a given room the number that can be conveniently accommodated will depend on the position and relation of the doors and fireplaces. In school-rooms there is at least one deciding element, and that is the desk to be used. The desk is, in short, the *unit*, for it is upon the number of desks or groups that can be arranged with economy and convenience that the proportion of the room and the accommodation will depend.

The lighting is another point, though quite subsidiary to the desk, in laying down the shape and size of a school-room. Thus, as a school-room has to be regulated by the desks in length, it is only necessary to define a proper width. The rule says : "The proper width for a school-room is 18ft. to 20ft., or 22ft. If the width does not exceed 20ft., groups of three long desks must be used ; if the width is 22ft., small desks, five rows deep, must be used." This is an indispensable rule, but hardly worded with clearness.

Sub-section (*a*) says : "Accommodation is calculated by the number of children seated at desks and benches"—information that ought properly to have been placed first, as indicating the principle upon which accommodation is determined. Another sub-section states that "wasted space cannot be considered." It would have been certainly more convenient to have placed the particulars relating to desks and benches after the rules as to school-rooms, as the length of latter depends entirely on the allowance for each scholar ; in the Blue-book these particulars come after "Sanitary Arrangements" —surely an error. The architect naturally wants to know, after the width, what length his school-room is to be, and to find out this he must know what lengths the benches and desks should be. The allowance per pupil is 18in. (in the dual desk the usual length is stated to be 3ft. 4in.), so that the length of each group should be some multiple of 18in., with gangways of 18in. between the groups. The number of groups is not given, but in the old instructions it is stated that a separate school-room is to be built when more than five or six groups are necessary. The dual desk gangways are 1ft. 4in. In the old rules, a copy of which is before us, the 18in. allowance is given for the junior classes, and not less than 22in. for the senior classes ; the length of each group, therefore, would be some multiple of 18 or 22in., a table of the lengths of groups and accommodation being given, also a plan of the arrangement. This plan is not given with the present rules. Another of the new rules is important to remember : "No benches and desks should be more than 12ft. long, and no group of long desks should contain more than three rows of benches and desks." A greater number of rows entails more effort on the part of teacher, who has to raise his voice. Each group is to be separated from the contiguous group and from the wall by an alley of 18in. ; "*or* from the wall" is a little error that might lead to misconception.

Going back again to the rules for school-rooms, there are very necessary regulations respecting the position of doors and fireplaces. In rooms for children above 7 years of age, they are to be so placed as to allow of one side of the room being left free for the groups of benches and desks. A very important factor in the planning of elementary schools is the lighting. A clause says : "No school-room lighted from one side only can be approved." Taken in connection with another rule under "Windows," that the "light should be as far as possible admitted from the left side of the scholars," makes it appear very difficult to plan a school-room at all. A large end window to the left of the groups of desks is essential for light ; but so are windows on both sides—that is, windows at both ends, or windows opposite in the side walls. It goes on to say, "All other windows should be regarded as supplementary, or for summer ventilation. In cases where left light is impossible, right light is next best. Where neither is possible, the light should be admitted from a high point." So that, in short, the meaning is that left light is most essential, and must be obtained, and there should be windows as well on two sides for ventilating purposes. Hygienic authorities on lighting object strongly to windows facing the scholars, as it throws the teacher's face into the shade, and the scholars' books also ; a light from behind is also bad, as the pupils are in their own light. It follows then, from these considerations, that end windows are of most importance, but that one of them to the left of scholars should be the largest.

Class-rooms are calculated in a different manner. The rule says they "are calculated at 10sq.ft. if not providing accommodation for more than 60 children," which means —if there is any meaning at all—10sq.ft. of floor space per scholar ; the minimum size of class-room is fixed at 18ft. by 15ft. A class-room for 60 children would thus be a room, say, 20ft. by 30ft. ; six rows of dual desks are allowed in such a room. If the desks are longitudinally placed in a class-room, the width should not be less than 16ft. A very necessary regulation is that class-rooms should never be passage-rooms from one part to another, and their number should, where practicable, equal the number of classes in the school-room. The rules for class-rooms would have more conveniently followed those of school-rooms, and such structural details of walls and roofs placed somewhere at the end ; the arrangement is certainly not good. The rule as to desks, instead of coming after sanitary arrangements, with which it has nothing to do, ought to have followed that referring to schoolroom. Before the rules are issued, we should advise these alterations to be made. The rules cannot be too explicit. It is needless to refer to the height of school and class rooms, which are, as usual, not to be less than 12ft. if ceiled at the level of wall-plate, and if area is more than 360ft. super., 13ft. ; if more than 600ft. super., then 14ft. ; but if the room is ceiled to the rafters and collars the walls must be at least 11ft. high and 14ft. to the ceiling. Brick walls are to be at least one brick and a half, and if of stone 20in. in thickness. It is important to remember that, in case a central hall is adopted, the area of it is not to be calculated in the accommodation nominally provided. The instructions about ventilation and warming are very general ; provision for fresh air is to be made apart from open windows and doors, and a separate air-chimney in the stack as an outlet is recommended to each room. The sanitary regulations appear to be the same as in the old form. Near the end we come to infant schools, which ought to have been placed after the rules for the senior school. The accommodation is calculated at 8sq.ft. per child, after deducting useless space. The teachers' house, and particulars as to loans conclude the book. The Education Department require a block plan to a scale of 20ft. to the inch, showing the drains and their fall, boundaries, &c., a plan of each floor to a scale of 8ft. to an inch, showing internal fittings ; sections, and at least four elevations and a detailed specification.

In connection with this subject we may refer to a few facts in the report of the School Board for London for the year. We gather that during that time, ended Lady Day, 1887, the Board were engaged in the purchase of 49 sites. According to the table prepared, the total cost, including legal and surveyors' charges, amounts to £2,153,327 12s. 5d., and, as the schools provide for 345,000 children, the cost of site per head is £6 4s. 10d. After giving a list of 18 new schools opened during the year, the report states that 361 schools had been erected at Lady Day last, the average cost per head being—for school buildings £10 19s. 9d., and for furniture 10s. 7d. These figures scarcely give the actual expenditure. The tenders for seven new schools show an average cost per head of £11 19s. 3d., and the cost of enlargements, which are becoming yearly necessary in several schools, shows an average cost in some cases of over £15 per head—the cost being increased owing to the original buildings not having been devised for extensions. A great deal of unnecessary expenditure has been entailed in the building and fitting up of many of the schools ; but the London School Board have by this time learned by experience, and their future course ought to be guided by it.

ROYAL ACADEMY PRIZES, 1887.

THE following is a complete list of the whole series of awards :—

Historical painting, "Captives," gold medal and travelling studentship (£200), Arthur T. Nowell ; landscape painting, "Sunset after a Storm," Turner gold medal and scholarship (£50), Arthur Trevethin Nowell ; landscape painting, "An Old Water Mill," Creswick prize (£30), Stephen Briggs Carlill ; painting of a figure from the life, silver medals, 1st, not awarded ; 2nd, William Farran Littler ; painting of a head from the life, silver medals, 1st, Minnie Jane Shubrook ; 2nd, Maud Porter ; copy of an oil painting, "Man in Armour," by Van Dyck, silver medals, 1st, Arthur Claude Cooke ; 2nd, Thomas Henry Jones ; copy of a landscape, "The Lock," by John Constable, R.A., silver medal not awarded ; cartoon of a draped figure, "Demosthenes on the Sea Shore," silver medal and prize (£25), Alfred Bernard Sykes ; design in monochrome for a figure picture, "Jehu and Jezebel—2 Kings, ix. 30-33," Armitage prizes, 1st (£30 and bronze medal), William Farran Littler ; 2nd (£10), Walter Stanley Paget ; design for the decoration of a portion of a public building, "Summer," prize (£40), William Ernest Reynold Stephens ; drawing of a figure from the life, silver medals, 1st not awarded ; 2nd, Herbert James Draper ; set of six drawings of a figure from the life, 1st, prize £50, Charles Thomas Rudkin ; 2nd (£25), Stephen Briggs Carlill ; 3rd (£15), William Farran Littler ; 4th (£10), Percy Short ; drawing of a head from the life, silver medals, 1st, Joseph Walter West ; 2nd, Mary Catherine Abercombie ; drawing of a statue or group, silver medals, 1st, not awarded ; 2nd, not awarded ; drawing of a statue or group, prize (£10), Lydia Bacon King ; perspective drawing in outline (open to painters and sculptors only), "The Exterior of St. Paul's Church, Covent Garden," silver medal, Edith A. Cooper ; line engraving of a drawing of a figure from the life, gold medal and prize (£25), no competition ; composition in sculpture, "An Act of Mercy," gold medal and travelling studentship (£200), George James Frampton ; set of three models of a figure from the life, 1st prize (£50), William Goscombe John ; 2nd (£20), William Ernest Reynold Stephens ; model of a design, "An Episode of the Deluge," 1st prize (£30), William Goscombe John ; 2nd (£10), Arthur George Walker (disqualified, owing to having received the same prize in 1885) ; design for a medal, "A Prize Medal for a School of Art," silver medal, not awarded ; model of a figure from the life, silver medals, 1st, John Rollins ; 2nd, James Nesfield Forsyth ; model of a statue or group, silver medals, 1st, Andrea C. Lucchesi ; 2nd, Charles John Allen ; model of a statue or group, prize (£10), William Henry Prosser ; design in architecture, "A Railway Terminus," gold medal and travelling studentship (£200), Robert Weir Schultz ; set of architectural drawings, "St. George's Church, Bloomsbury," silver medal, 1st, Percy Norman Ginham ; set of architectural designs (Upper School), prize (£25), William Leck ; set of drawings of an architectural design (Lower School), prize (£10), William Alford ; perspective drawing in outline (open to architects only), "The Caryatide Portico of the Erectheum," silver medal, no competition.

The Landseer scholarships in painting and sculpture, of £40 a year each, tenable for two years, given for the best work done in the examination for passing into the second term of studentship, have been awarded—in painting, to Ernest W. Appleby and Herbert James Draper ; in sculpture to William Goscombe John and William Ernest Reynold Stephens.

The subject for the Gold Medal and Travelling Studentship in the Architectural School was a railway station or central terminus, to be built without the usual adjunct of a huge hotel as a mask to the front façade. Some of the competitors, realising the difficulty of rendering the end of so necessarily vast a building, comprised as it must be of one great central nave, and covered by a single

roof of one wide span, with anything like the usually recognised types of architectural effect, sought a solution of the problem by introducing towers, either centrally placed or as flanking features to the main façade; others, with high mansard-roofed and meaningless pavilions, endeavoured to produce an ambitious composition worthy of the occasion; while a few competitors, discarding such expedients, emphasised the approaches to their station either by inclosing a grand forecourt with colonnades and covered ways, or by introducing ingeniously contrived raised terraces and inclined roadways. In planning, a considerable variety of arrangement was displayed, too; the main idea, however, of a station in this respect being in all of the designs fairly well realised. Roughly speaking, the main difference consisted in the mode of placing the booking halls and waiting rooms, some competitors wisely contriving them in front of the station, and others, with less judgment, placing them on one side. The question, however, mainly resolved itself into the architectural treatment adopted, and herein, as might be expected, an almost unlimited diversity of taste and idea was displayed in the nine designs submitted in the competition. The prize was unquestionably well competed for and, no doubt, on the whole, it has been deservedly won by Mr. Robert Weir Schultz, though there are many points in the next design, No. 331 (said to be by Mr. W. Leck) which merit recognition. The chosen design, an evident study of the Terminus at Paris of the Northern Railway of France, acknowledges the great roof which, by the nature of things, dominates the whole composition, and the author grapples with the bigness of scale thus imposed upon him in a massively muscular way, while with a few telling features he gives us a façade marked by breadth of treatment and an air of practical utility. If there is not, however, any marked degree of originality in his work on this occasion, Mr. Schultz is to be commended for his refined study of detail. The great pediment at the end of the central nave is crowned by a clock panel, with sculptured figures on either side representing "Night" and "Morning." The end window below this feature is a vast semicircular opening, divided ingeniously with iron uprights and transoms, and the walls are of brick, relieved by bands of stone. Over the principal entrance, which is in itself somewhat dwarfed by the colossal lions on either hand, are the Four Winds carved on the wall, after the fashion of the tower of Andronicus Cyrrhestes at Athens. Flanking the central gable are groups of figures supporting globes. The "entrance" and "exit" archways are at the extreme ends of the main front, and the refreshment rooms, &c., occupy a low range of buildings treated in a Renaissance manner in front of the great booking hall. The absence of a cross-section showing the construction of the station roof is conspicuous in all the designs.

No. 331 is clearly a fine design, somewhat more architecturalesque and gracefully worked out. The gable at the end of the nave roof shows as before, but here is treated as a pediment, having an outline which is commonplace, and of poor proportions. In the centre sit salone the vulture-tortured Prometheus as patron of physical power. At one end of the building rises a well-grouped tower, elegantly detailed and beautifully drawn, with flanking pavilions, having rather shapeless pediments over their elevations, and standing somewhat in advance of the tower. The square-headed entrances are ill proportioned, and do not accord with the arched openings for carriages. No. 332 is gaunt in idea, and ill-considered; indeed, its author, Mr. E. H. Sedding, has clearly not given sufficient time to the working out of his composition. Its plan, too, is not good. The raking loggia sloping up the sides of the flanking walls in front is unhappy and restless in effect, while the overbearing proportions of the big central arch crush the arcade below. No. 333 shows the arched iron girder construction of the great roof over the station, which is placed between two cleverly-treated towers surmounted by domes. A great fore-court leads to the fine entrance portico outside the booking hall. The end wings ranging beyond the towers are too disconnected, both in scale and effect, from the main structure to be pleasing. This set is admirably drawn. No. 334 has a central tower with high-roofed pavilions to the right and left of the screen of hotel-like buildings. The plan seems poor, and the roof of the station has no connection with the show buildings, which are isolated from it in front. No. 335 reminds one of a Casino, with its nondescript style of architecture, devoid at once of repose and regardless of moderation. Its detail is extremely well drawn, and is, in its way, refined and studied. The tower suggests a copy of Messrs. Aston Webb and Bell's campanile, which was placed in front of their Imperial Institute design, to its great detriment. The sloping ways which form an approach to the Station are a feature, too, in this composition. No. 336 is exceedingly poor, smacking of an American hotel, with an endless series of bedrooms. No. 337 is quite one of the best designs in the competition, with a fairly good plan and nicely drawn elevation, at once dignified and enriched with well-placed statuary. The detail, however, is unworthy and meanly rendered. No. 338 is the last and, perhaps, the least important of the whole series; but the author has a sense of the relative value of solids and voids, notwithstanding his common-place design. Mr. Percy Norman Ginham wins the Silver Medal for a set of carefully-measured drawings of Hawksmoor's church of St. George's, Bloomsbury, built in 1731, with its truly fine portico and most ridiculous steeple, planned, it is said, from the description in Pliny of the tomb of King Mausolus in Caria. St. George, represented by the figure of King George I., surmounts the structure, whence the epigram:

> "When Harry the Eighth left the Pope in the lurch,
> The Protestants made him the head of the church;
> But George's good subjects, the Bloomsbury people,
> Instead of the church made him head of the steeple."

Hogarth figured this tower in "Gin Lane," and now the building has been measured for the Royal Academy Silver Medal. Street "improved" the interior of this church some years ago, and Mr. Ginham has carefully measured the altar and baldacchino, a feature of which Hawksmoor was very fond. The font is curiously placed in an apse on the east side of the church, the chancel facing north.

The money prize for the year in the architectural schools is given to Mr. Wm. Leck for a design illustrating a street front over a fish shop. The style is French Renaissance of early date, and the façade is surmounted by a shaped gable rising by the side of a conically-roofed circular tower. The detail is good, and the drawing no doubt is the best of the series. Mr. Wm. Alford's "School of Art," which wins a £10 prize, is clever; but the majority of the designs exhibited as the work of these classes is very poor and characterless. Mr. Thomas Maclaren's sketches from Italy and Pompeii form one of the best sets of architectural studies ever shown at the Royal Academy. Mr. E. H. Sedding shows also his series from York, Winchester, and Salisbury, drawn in pencil with much feeling; but without much sense of energy, as compared with Mr. Maclaren's work. Mr. A. Bernard Sykes' masterly cartoon of "Demosthenes by the Seashore," which so deservedly won the R.A. Silver Medal for a draped figure, is one of the best works in the exhibition. Mr. W. E. R. Stephens' decorative prize work is also an admirable composition.

THE SOCIETY OF ARCHITECTS.

THE third ordinary meeting of the Society of Architects for the present session was held at St. James's Hall, Piccadilly, on Tuesday evening, Mr. H. Roumieu Gough, ex-president, in the chair. Six nominations for membership were read. The CHAIRMAN called attention to the fact that a petition in favour of the Architects' and Engineers' Registration Bill, to be introduced next session by Col. Duncan, C.B., M.P., was lying upon the table for signature. A letter of condolence was ordered to be sent to Mr. Edmund Woodthorpe, M.A., on the recent death of his father, the well-known district surveyor, on the motion of the CHAIRMAN, seconded by Mr. W. H. SETH-SMITH, the former remarking that the late Mr. Woodthorpe was one of the members of the Institute who took a warm interest in the Society and its work.

THE RELATION BETWEEN ARCHITECT, SURVEYOR, AND CONTRACTOR.

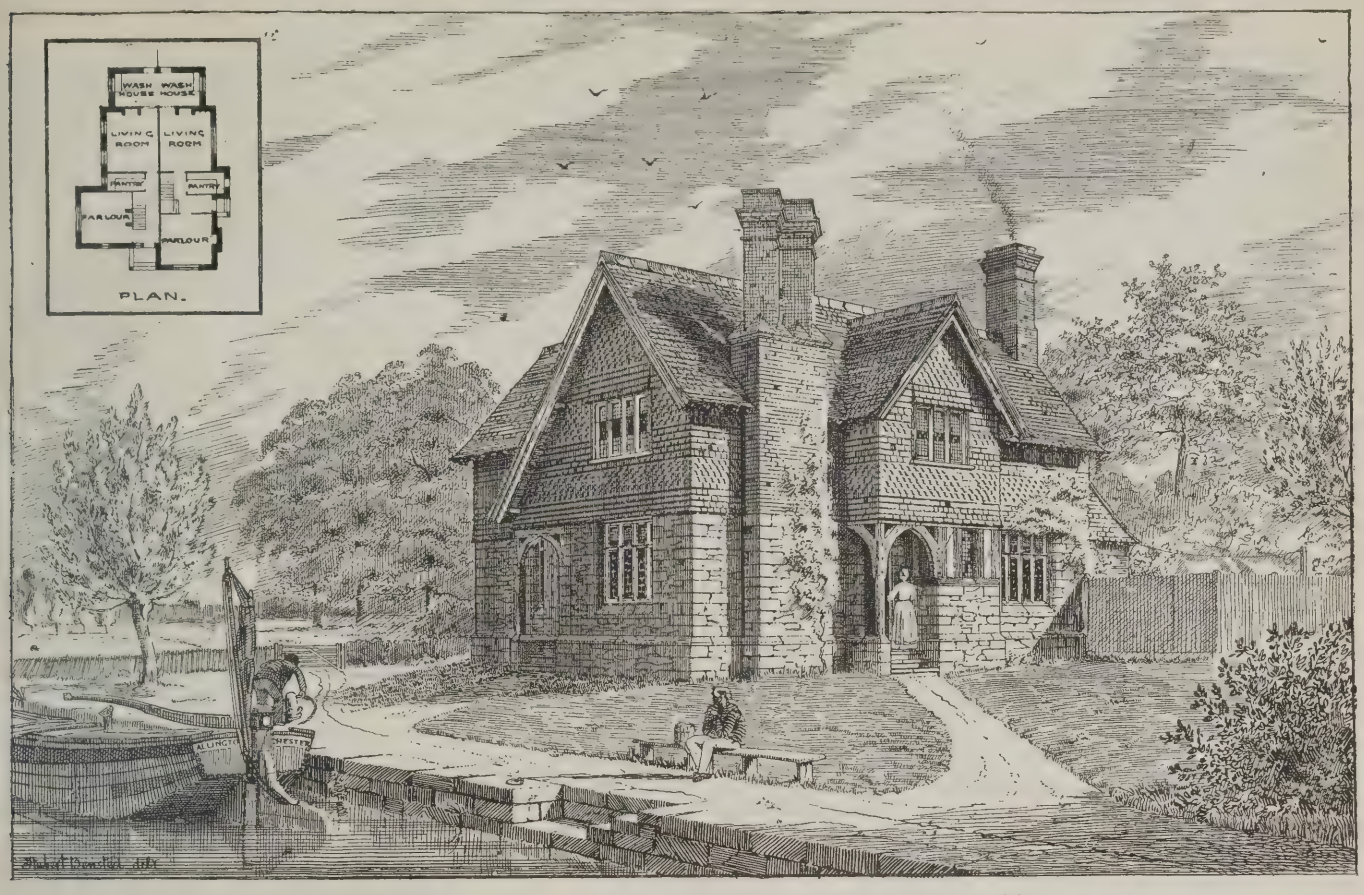
A paper on this subject was read by Mr. JOHN LEANING, and will be found on p. 892. At its close

Mr. SETH-SMITH proposed a vote of thanks to Mr. Leaning for his instructive paper. Its very technicality was, he thought, one of the chief merits of the lecture, which was so full of practical information that it could not fail to be interesting. He had known Mr. Leaning for many years, and knew that his practical knowledge, ability, and business habits qualified him to deal with the subject. As to the conditions of contract, it was very difficult for them as architects to bind themselves to any particular form, for it was not uncommon for clients to send forms drawn up by their solicitors, which were, as a rule, more stringent than that known as the Institute form. The latter was often objected to; but he, like the lecturer, approved of it. However careful an architect might be, extras would often crop up, and in alterations to old buildings, for instance, were almost unavoidable, as no one could foresee the state of work till opened out. It was of the utmost importance that architects should be particular in their specifications, both in the general portion and in the provision of definite sums. Where certain items, such as ironwork, were ordered of special firms, a building agreement should be made with such firms for delivery by a given date so that no delay was caused to the builder.

Mr. J. T. HOLLAND seconded the motion, which was supported by Mr. W. ALLPORT, who said that one Scotch architect formerly practising in London used to make all drawings to a ¼in. scale, and all details to a ½in. scale, giving as a reason for the unusual scale, that he did not like builders' foremen to measure off his drawings; but wished them to accept the figured dimensions. The mode was much better than the common one of adopting any scale for details which would just fill the space in the sheet available.

The CHAIRMAN remarked that one useful clause in a contract was to stipulate that the contract drawings, specifications, and all other papers, were the property of the architect, and were to be returned to him in good condition on the completion of the undertaking. As the client signed this contract as well as the builder, all question as to the ownership of the drawings was set at rest, and no client would object to enter into such a contract if it was explained to him by the architect at the outset. The plan of numbering all rooms instead of naming them saved much work in preparing the specification and quantities, and lessened the chances of mistake. Although it was usual among professional men to name an architect of good standing as arbitrator in case of dispute, it would, as Mr. Leaning had suggested, be preferable to appoint a surveyor, as disputes generally turned on questions of extras and omissions. It should be the endeavour of architects to set clients to agree that the quantities should be made the basis of the contract. As to the best form of contract, his own plan was to make the tender a contract, and to refer in it to the drawings, specification, bills of quantities and conditions, and when it was stamped it became a legal document. Contracts drawn up by solicitors were too wordy, and there was some risk of alterations and omissions slipping in undetected.

Mr. R. O. ALLSOP suggested that to all references to special articles to be provided for



should be added the words "p.c., allowing for cartage, fixing, and profit."

Mr. Leaning, in reply, said he had constantly adopted the usage as to "p.c." of provisions, and a quibble rarely arose. Where the contractor had to take trouble in procuring a fitting specified as "p.c." he ought to be allowed the usual profit, say, of 10 or 15 per cent. on the item. As years went on quantity surveyors naturally grew more liberal towards builders. He agreed with Mr. Seth-Smith that it was impossible to tell the condition of old buildings until one began to take them down, and a tender based on specifications for such work must be more or less uncertain.

THE RELATIONS OF ARCHITECT, SURVEYOR, AND BUILDER.*

I PROPOSE to offer a few comments upon some of the points of the architect's and surveyor's practice—considerations which may help to make a contract work smoothly, and to bring it to a successful issue. And first, as to uniformity of practice. In comparing the work of architects and surveyors with that of solicitors, for instance, a striking difference at once presents itself. We find all the procedure in the initiation of an action settled and uniform, all the forms referable to some accepted type, and the facts being known, the majority of the cases of legal process may be taken up at any stage of their progress by any qualified solicitor, and continued with a certain amount of confidence as to what has gone before; but to adopt the work of an architect or of a quantity surveyor is a widely different matter. The variety of *their* methods is very great, and before one can take up either in course of its progress, much investigation, much more than should be necessary, is inevitable. I do not think this should be so. Up to a certain point the initiatory process of all building undertakings might be, and should be, alike, and I think the advantages would be great and unquestionable. It is not difficult to furnish a reason for this condition of things. It is only to repeat what has so often been said of late, that we have no system of architectural education worth the name, nor shall we have until some central organisation authoritatively constituted shall furnish such machinery as shall impart the necessary instruction in science, forms of professional practice, the principles and history of art, and such subjects, all of which may be taught with as much certainty and precision as the principles of mathematics. The diversity of action is largely referable to ignorance of the best methods. A certain amount of training, to be tested by examination, upon which permission to practise shall depend, should be made imperative. A moment's consideration of what experience means is sufficient to convince us of this. In the early stages of our work we have all known what it was to dissipate our energies in unprofitable, ill-considered effort; now we go direct to our ends with a certainty which nothing but knowledge and practice can afford. Facility has been acquired through a long series of painful mistakes and shortcomings, all of which, under a better system, might have been avoided. The experiences of a quantity surveyor, seeing, as he does, the work of many different architects, gives him somewhat favourable advantages for its criticism. The surveyor, of course, sees many different styles of drawing and various degrees of finish. I may say, in passing, that I offer these opinions with deference to the architectural ability I see around me. As to the scale of drawings, I think the most embarrassing, characteristic of a set of drawings is a great variety of scales in one set. Sometimes the drawings for one building range through almost all the varieties. Most surveyors have had to deal with the drawings of a building in which one had $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, 1in., quarter full size, full size. Considerable errors have arisen from this diversity, such as inadvertently using $\frac{1}{8}$in. for $\frac{1}{4}$in. scale drawing. The scale of $\frac{1}{4}$in. to a foot is most unpicturesque, and unless much much useless labour is expended upon it has an ugly, bare effect; it costs more, too, which is a consideration. The most widely useful scale is $\frac{1}{8}$in. to a foot, and I think the balance of opinion is greatly in favour of this. The details may be to any larger scale, but I think they should all be over $\frac{1}{2}$in., as this is generally too small to be of much use. General drawings often usurp the functions of the specification; it is best that they should have nothing upon them beyond what is absolutely necessary. Considering the prevailing impression as to the inadequacy of the payment of architects, it has often surprised me that so much unnecessary labour should be bestowed upon working drawings, such as colouring, which means nothing, and is solely for effect. Some drawings display all the finishings, as doors, framings, cornices, skirtings, &c. Some draughtsmen even go to the length of back-lining their drawing, an absurd practice. The respective advantages of thick and thin lines has been argued often enough; those who use thick lines are greatly in the majority, and I quite agree with them. The neglect to finish a set of drawings until the work has considerably advanced is a dangerous habit in many ways. Unfinished drawings are a source of legal danger, and cannot have been properly considered until they are finished; moreover, the ultimate expenditure of time is invariably greater. Another weakness of draughtsmen is the making of the sections through the easiest parts of the building; not putting the sectional lines on the plan, or putting them on without distinguishing letters. Elevations, I think, are best described by the points of the compass, and it is certainly most convenient. Elevations may be highly finished much more reasonably than plans. A roof plan is often omitted in the preparation of a set of drawings. When the roofs are at all complicated this often involves alteration and consequent extra work. A plan of the drains should also be supplied; these are often a subject of provision which is generally of insufficient amount. The best drawings that come before me are carefully figured, and this should always be done, especially the ground plan. All the dimensions should be of the carcase—that is, openings and rooms should be in the clear of the brickwork, heights of stories from top of joists to top of joists. It is a good plan to avoid repeating the dimensions of the same thing on another plan; if you make a mistake it gives everyone more trouble than no dimension at all. Drawings may often be much increased in usefulness by indicating by a red line on the elevations the levels of the floors. The distinction on plan between ventilating and smoke flues is often a convenience. A letter V on the former is sufficient in large buildings; flues are sometimes numbered with advantage. Number your rooms, if possible, and consecutively; you will shorten your specification by so doing. Numbers are more easily described then positions. The quantity surveyor sees specifications of various qualifications and construction. Want of precision of statement and absence of systematic arrangement are the most frequent defects. Of course, when one does not know what one means, it is specially difficult to make others understand. Unnecessary repetition is another common fault—the same phrase frequently repeated, which, judiciously placed, might have served for the whole document. Everything is to be done in a proper manner, or a workmanlike manner; but none of these clauses will compare with specific directions as to how the work is to be done. A proper or workmanlike manner may mean so many different things. The only sound preparation for specification writing is a thorough knowledge of construction; without this any specification must be vague. I am sure I need not appeal to you to avoid clauses which shall not catch the builder. There is a tendency in this direction, induced, no doubt, by the desire of the architect to protect himself from extras, and the eagerness of the building owner to obtain more for his money than he has any right to expect. A moment's thought is enough to show us how much harm one may do to a builder in this way. Clauses which provide alternative methods of work or qualities of materials are frequent causes of dispute. If you offer alternatives, let it be clearly understood that the decision—the selection—shall be yours. But to consistently carry out the principle that the exact cost of the building shall be represented by the lowest tender, some rather comprehensive clauses are essential: as that contractor shall keep foundations clear of water; be responsible for all accident to the projected building and adjoining ones affected by the contract works; shall fill up all old drains and cesspools; shall insure from fire, &c. But it is most unfair that contractor should be made liable for increased foundations beyond those specified and shown on drawings; and in the majority of cases, the simple precaution of digging a few trial holes will show beforehand what is necessary. It must not be too readily assumed that every obligation can be transferred from building owner to contractor. The work to party-wall will often vary beyond any reasonable expectation, and there are obligations as to lateral support and general damage to adjoining buildings, which cannot be transferred, whatever the contract may provide. It is beyond the intention of this paper to deal with legal aspects; but I may mention the cases "Hughes v. Percival," "Dalton v. Angus," "Lemaitre against Davis," all of which bear upon these points. But whatever your practice may be in such matters, it is unquestionable that an estimate is always unduly increased by a specification or bill of quantities which provides for throwing such obligations upon the builder; he invariably, and quite naturally, makes himself safe on these points by including an exorbitant sum to protect himself. Another important consideration is, what conditions you shall adopt. For general fairness and comprehensive scope I do not think any are to be preferred to those published by the Institute. There has been some talk of their amendment; but I do not think they will be much altered. Taking these conditions in their order:—Condition 1 provides that the work shall be done according to the true intent and meaning of the drawings and specification, and whatever cases of discrepancy occur the architect shall decide which shall be followed. Some conditions go further than this, by adding "Should anything necessary to the perfection of the work have been omitted in either drawings or specification, or both of them, the same shall be deemed to be included in the estimated price, as if the same had been shown or set forth in both." Such a clause imposes an obligation on surveyor and builder which they should not be subjected to: it is properly a building-owner's risk. Conditions 2 and 3 are in substance so commonly adopted that they require no comment. Condition 4 provides for the supply of drawings and specification, maintenance of a foreman on the works, and forbids sub-letting work except by permission. Some architects stipulate for the return of all drawings, tracings, models, &c., furnished for the purposes of the building, without copies being kept—a kind of assertion of architectural copyright. The clause as to sub-letting is practically dead. Very few buildings indeed, are erected without sub-contractors, and the architect's permission is hardly ever asked for. Whatever the architect may see and know, I believe he will always save himself trouble if he avoids any legal recognition of the sub-contractor; the opposite course will be almost sure to compromise him in one way or another; but this need not prevent a sub-contractor being made use of in the settlement of accounts, when he can probably furnish valuable information. Condition 5 requires no comment. It gives the architect right of access to the works and power to dismiss obnoxious workmen. Condition 6 forbids deviation from contract except by order, defines order for extras, and provides for delivery of day accounts. Written orders for extra works should always be given. Some architects have a book like a certificate book for this purpose—an easy and commendable plan, as the foil forms a register of extra works. I need not remind you that when the conditions stipulate for a written order, its non-existence is quite sufficient legal warrant for refusal to pay for the work in question; but part of the condition which provides for the delivery of day accounts during the week following that on which the work was done is rarely enforced—but it should be, for it is an admirable check. Some builders price the items in each day account. I advise architects to refuse them if priced; the rates are best arranged at the settlement of accounts. There are various works which are properly charged in the form of day account. Works of incidental pulling down and alteration should

* By John Leaning, M.S.A. A paper read before the Society of Architects at St. James's Hall, Piccadilly, Dec. 13, 1887.

A PAIR OF COTTAGES, ALLINGTON LOCK.

always be allowed in this form. The builder's common practice is to combine several pieces of work in one account (presumably that they may be the harder to check). Each piece of work should be kept separate. You can then, if you desire to do so, check it by approximate measurement. The result of experience is probably to modify that complete prostration of mind which besets the young surveyor at his first sight of a voluminous day account. I must confess, after seeing so many of various kinds, that I am even now occasionally lost in astonishment over some of them, as many of you are, gentlemen, I don't doubt. In the majority of cases the time is overcharged—the fact is, a foreman is put on the work to make it pay, and the retention of his employment depends upon it. Some builders give a foreman a percentage, besides his wages, upon the amount of a contract which proves profitable. One should not wonder, under the circumstances, that day accounts are swollen, and this without any specific instructions by the master builder; indeed, I am convinced that generally he gives directions to the contrary. In these remarks I make no imputation upon the honour of builders as a body; the majority of those with whom I am acquainted are men whose words and actions may be relied on; but that is not the point at issue. Your schedule of prices should define the treatment of foreman's time, cartage, lodging money, tool sharpening, and charges for scaffolding. Condition 7 provides that variations shall not vitiate the contract, and states that such works shall be priced according to schedule of prices annexed, or at fair measure and value. This requires modification: it is best to provide that the contractor shall deposit a copy of the priced bill of quantities, or of his original estimate, and that extras and omissions shall be priced at the original rates or analogous ones. Condition 14 provides for free access of persons other than the contractor and employed by building owner, and that contractor shall afford facilities. It is well to define these facilities by stating that it is to include the ordinary scaffolding and ladders. Special scaffolding is better specifically described with the work for which it is required. Clause 15 provides for time of completion and penalty. As a general rule the most equitable application of this clause is the extension of the time in the proportion that the amount of variation (often the total both of additions and omissions) bears to the amount of contract. In attempting to enforce the clause for liquidated damages you will have to prove loss, and you must exclude wet days from your calculation. In this connection it must not be forgotten that by an extension of time for completion you condone the offence, and lose your right to take possession of the works.

(To be continued.)

PAIR OF COTTAGES, FOR THE LOWER MEDWAY NAVIGATION COMPANY.

THESE cottages are being erected at Allington Lock for the accommodation of the *employés* of the company. The lower story is of Kentish rag stone, with dressings of artificial stone, left as it comes from the mould; the upper story is of tile-hanging on quartering. Mr. Hubert Bensted, of Maidstone, is the architect, and the work is being carried out by Mr. John Froud, jun., of the same town, at a cost of £474.

THE FURTHER REGULATION OF THEATRES, &c.

AT the meeting of the Metropolitan Board of works the other day the draft of a Bill was submitted by Mr. Selway for the regulation of theatres and music-halls, and of other public buildings in the metropolis. The purpose of the Bill is to enlarge the powers of the Board in enforcing conditions which would minimise the risk of fires in theatres and other public buildings. The committee was authorised to confer with representatives of the theatrical and musical professions. Mr. Augustus Harris, lessee of Drury Lane Theatre, who represented the views of theatrical managers, thought such a conference would lead to no practical result, and that they objected to any further powers being acquired by the Metropolitan Board for the regulation of places of public entertainment. In addition to inspecting and enforcing these legal powers in respect of a number of music-halls, the Board had dealt with 41 metropolitan theatres, and those engaged in the work of inspection had been astonished at the cupidity of managers in allowing such places to remain. Since the powers vested in the Board were called into operation four theatres had been closed, one reconstructed, and in 27 others alterations had been made. The Bill now promoted gave the Board increased powers of inspection and a further authority to order structural alterations in the interests of the public safety. At least once a year, and oftener if required, the officials are to be allowed to inspect all theatres and music-halls in the Metropolis. The Bill also enabled the Board to deal with club premises used for public entertainment. The powers conferred on the Board enabled them not only to insist on structural alterations being made in accordance with their suggestions, but that those alterations were kept in the stipulated efficiency; that the staircases are not obstructed by pay-boxes, or the gangways blocked by chairs, and to have proof that the exits opened outwards, and were not sealed by unnecessary fastenings. The Bill had been promoted at the request of the Lord Chamberlain, and it would be an advantage to the licensing authority to be in possession of the Board's certificate as to the safety of any place of amusement. If the Bill ever passes, we hope it will be made certain that the Board's officers will administer it impartially. Some recent statements made by Mr. Augustus Harris—which have been commented on by the daily papers, but to which, as they are at present *ex parte*, we do not care more definitely to refer—are, to say the least, disturbing.

The Victorian Government rail contract, for the supply and delivery of 41,500 tons of steel rails and 2,100 tons of steel fish plates in Melbourne, has been awarded to Messrs. M'Lean, Brothers, and Rigg (Limited). It is understood that the whole of the work will be placed in the North of England.

A new pulpit and reading-desk have just been put in the Congregational Church, Salisbury, replacing temporary fittings which have been in use since the church was built in 1879. They have been executed by Mr. Harry Hems, of Exeter, from designs by Mr. Abley, of Salisbury. The pulpit is of Beer stone, lined with oak panel work, and the reading desk is of carved oak.

CITY OF LONDON COURT, GUILDHALL BUILDINGS.—NEW CLUB, WIVELISCOMBE.—FOUNTAIN, WALTON WELL, OXFORD.—DETAILS OF NORTH PORCH, CHRIST-CHURCH, HANTS.—HOUSES AT HEATON, NEAR BRADFORD.—BISHOP BRIDPORT'S MONUMENT, SALISBURY.—SKETCHES FROM ITALY.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NEW CITY OF LONDON COURT, GUILDHALL.

The portion of the new Court building now in course of execution occupies the sites of the old Court, the Land Tax Offices, and the Tap of the "Guildhall Tavern." It will ultimately, on the expiration of a short lease, be extended over the site of No. 84, Basinghall-street, the new building having been designed to cover the entire area. On the ground floor will be offices for clerks and bailiffs; on the upper floor the Judge's Court, 45ft. by 26ft., and the Registrar's Court, 35ft. by 25ft., each with a private room attached, and approached by a separate stair and entrance. The general entrance will be in the centre of the façade to Guildhall-buildings, and will open into a hall and staircase, giving access to the offices on the ground floor and to the Courts above. In the basement will be lavatories and stores for books, papers, &c. The style is Late Gothic, similar to the styles adopted for the Library and the new Council Chamber. The external moulded work will be in Portland stone, with grey granite plinths; the walling of Kentish rag. Internally, the hall and staircase will be of Bath stone, the open roof of oak; the Courts will have wainscot panelled ceilings. The plan has been designed with the view of obtaining ample space and plenty of light, with good ventilation. The warming will be effected by means of hot-water coils and pipes. The amount of contract is £13,637; architect's estimate, £14,500. The architect is Mr. Andrew Murray, A.R.I.B.A.; and the builder Mr. James Morter, of Stratford. The following is the ground floor plan:—A, public entrance and staircase hall; B, public; C, process and hearing and general clerks; D, chief clerk; E, accountant; F, strong room; G, safe closet; H, Registrar's entrance; I, public waiting-room; J, bailiffs; K, high bailiff; L, Judge's entrance. The first floor plan is as follows:—A, Judge's court; B, Judge's room; C, Judge's lavatory; D, Judge's staircase; E, public staircase and landing; F, Registrar's Court; G, Registrar's room; H, Registrar's lavatory; I, Registrar's staircase; J, counsel; K, robing-room; L, lavatory; M, attorneys; N, lavatory; W, X, Y, Z, site of No. 84, Basinghall-street, and will form extension of Court buildings in six years.

NEW CLUB, WIVELISCOMBE, SOMERSETSHIRE.

This building is being erected as a local Jubilee celebration; the foundation-stone was laid on Jubilee day by Mrs. W. Hancock. The building is being carried out in local stone, with Ham Hill dressings, the half-timber being in solid oak. The architect is Mr. T. W. F. Newton, 121, Colmore-row, Birmingham, and the builder Mr. S. Richards, Wiveliscombe.

FOUNTAIN, WALTON WELL, OXFORD.

The inscription on the tablet will perhaps best give the *raison d'être* of this memorial. It runs as follows:—

"With the consent of the Lords of the Manor this drinking-fountain is erected by Dr. William Ward, to mark the site of a celebrated spring known as Walton Well, adjacent to the ancient ford-way called Walton Ford."

The architect is Mr. H. Wilkinson, Dover, and the work has been exceedingly well carried out by Mr. James Clifford, mason, Oxford; the carving by Mr. McCulloch. The stone used is Portland.

NORTH PORCH, CHRIST CHURCH, HANTS.

There is nothing of interest to be said about the North Porch, Christ Church, Hants, as the subject is so well known. The drawing forms one of a series made by Mr. Irwin and myself during a short stay in the neighbourhood. The porch was restored, we believe, by Mr. Ben. E. Ferrey, jun., some years back. It has a fine parvise over, used by the monks as a school and reading room in their day.—Percy G. Stone.

SEMI-DETACHED VILLAS, HEATON, NEAR BRADFORD, YORKS.

These villas, built for Mr. John Maddocks, occupy a commanding position in the most fashionable suburb of Bradford. They are built of pitch-faced delfstone wallstones, relieved with sandstone ashlar dressings, and covered with green Westmoreland slates. The contracts have been executed by local builders, the architect being Mr. Herbert Isett, of Bradford and Wigan.

BISHOP BRIDPORT'S MONUMENT, SALISBURY CATHEDRAL.

Salisbury Cathedral, begun in 1220 and finished in 1258, is well known to be one of the purest and most beautiful of our cathedrals. It contains many features deserving of careful study of the student of architecture, and none more interesting than the fine tomb, of which we give an illustration, which is built in the form of a shrine, and is replete with taste and fancy. It commemorates Bishop Bridport, whose death took place but a few years after he had completed and dedicated his beloved church.—Fred. W. Richardson.

SKETCHES FROM ITALIAN CHURCHES.

CHOIR STALLS, ST. MARIA MAGGIORE, BERGAMO.

The choir stalls of St. Maria Maggiore, Bergamo, are an admirable specimen of the woodwork of the latter half of the 15th century. The carving, although profuse, is very delicate, and the intarsia work extremely rich, some of this being the work of Fra Damiano da Bergamo.

WEST DOOR OF ST. FRANCESCO, BOLOGNA.

This beautiful example of North Italian Gothic, with the typical protecting canopy of the period, dates from the latter half of the 14th century. The west façade was never completed, as was generally the case with churches of that period, but the whole structure is now undergoing complete restoration.

SCALA MINELLI, VENICE.

This staircase, the work of the end of the 14th century, is built of red brick and white stone. The stairs wind up for another story, and are then covered with a domed roof. The palace to which this appertained originally belonged to the Contarini del Bovolo, and afterwards to the family of Minelli. It is now used in connection with the hospital adjoining.

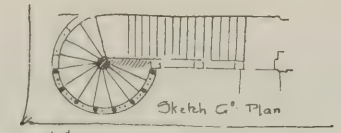
WEST DOOR, OR' SAN MICHELE, FLORENCE.

There are two west doors to this church, the one illustrated being the northernmost. The work dates from quite the end of the 14th century, and the tracery, although rich *en masse*, lacks purity of detail. The moulding section E is a detail of the four bases to main shafts. That marked B is of an amulet above on shaft, and from which the cusped hood springs. Edgar H. Selby.

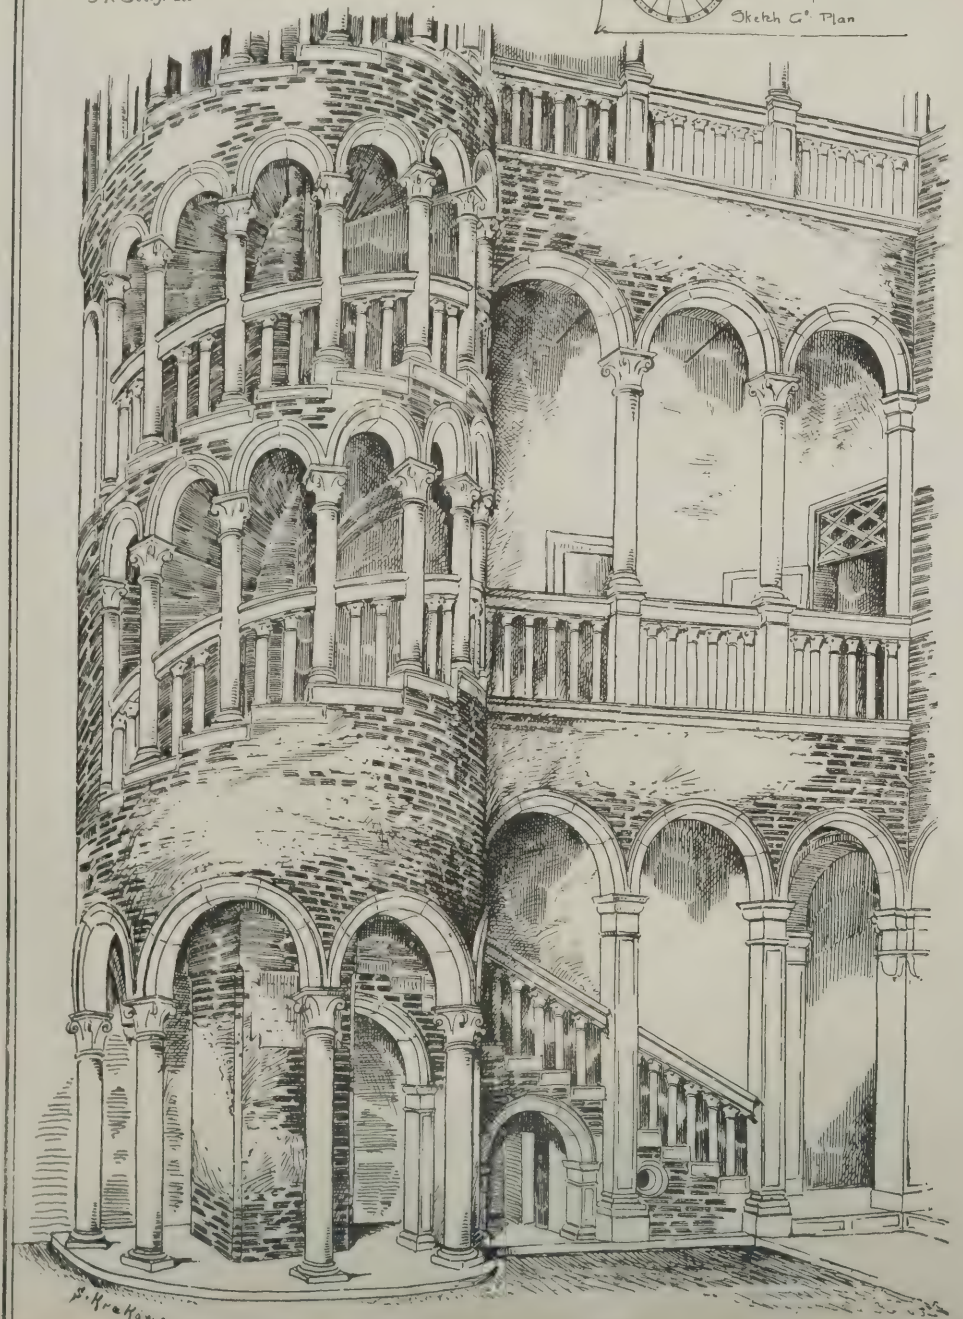
EXHIBITION OF ART AND INDUSTRY.

The Exhibition by London Apprentices, opened at the People's Palace, Mile End-road, last Saturday, by the Prince of Wales, is a promising beginning of what may be expected by organised efforts. The exhibition is divided into 15 classes, and includes printing and its allied branches, lithography, engraving on wood and on metal, bookbinding; various kinds of decorative art, such as woodcarving and painted decorations, designs for fabrics, embossing on glass; the arts related to cabinet-making or furniture, scientific instruments, and various trades connected with building and wood-working. Confining our attention to the latter branches, we notice at the top of one of the annexes a model interior, the combined work of members of various classes, from a design by Mr. F. Jacob, the instructor of the cabinet-making class. The grate (slow-combustion) and chimneypiece, with overmantel, the cosy seats, all painted white, and the wall-papers and drapery, are in good taste and harmonious colours. Some models of staircases by G. Down, John Davis, G. F. Jackson, and G. Stone are very creditable works. The small flight, with circular string and handrail (760), and the Gothic newel with moulded cap and base (757) show clever workmanship. In masons' work we note a buttress-head and panel (773); a stone-carved window, by J. Smart, from the Polytechnic classes. In plumbing several examples of hand-made traps, lead set-offs, lead pipe bending and bossing, and a model of a stack of soil-pipes with siphons and vents, by John J. Green. Bricklayers' work is represented by a model of a chimney, by H. Piper; a Venetian arch by Horatio Cansick; and a semi-arch moulded in the reveals by Alfred Hone. These specimens are all executed by apprentices. In furniture, we see a handsome brown oak sideboard of good character, with carved panels and mirrors, by an apprentice of five years (W. Rutter); also a pedestal table by Albert J. Carter, and several other specimens. Several examples of wood-carving are exhibited, for which the National Silver Medal, bronze medal, and other prizes have been awarded. These are by A. Norfolk, Williams, and G. W. Taylor. The panels and capitals sent by the School of Art Wood-Carving, City and Guilds Institute, are carved in pine and walnut, and are very creditable. Specimens of plasterers' work, including a doorway, pilasters, and capitals, and panels in Italian Renaissance, are the work of John W. Baker and Chas. A. Winter. Iron and general metal-work include some good examples of blacksmiths' and brass finishers' skill, and there are several nice specimens of wrought ironwork and *repoussé*. Especially noticeable are the specimens of chased and embossed ornament by Jas. R. Stebbing.

COMPETITIONS.



Birmingham.—After a year's consideration, and with professional assistance, the committee of the new Baptist Church, Moseley-road, Birmingham, have selected Mr. Ewen Harper, architect, of 57, Colmore-road, Birmingham, to carry out the work at a cost of about £4,000. The other competitors were Mr. J. A. Cossins, Messrs. Ingall and Son, Mr. Hughes, Mr. Sutcliff, and Mr. Newton.



Indianapolis.—We draw attention again to the competition for the Soldiers' and Sailors' Monument at Indianapolis, of which we gave full particulars in our issue of Oct. 28 last, in this column. The advertisement—owing to a mistake of a clerk on the other side of the water—has only reached us this week. A good many English architects have already had sets of particulars from us; any who still desire can do so by sending three stamps for postage. The secretary, in his letter to us, says that though unfortunately the time is now short, yet, as comparatively few drawings are wanted, some English architects may like to compete.

An inquiry was held at Wath, Yorks, on Friday before General C. P. Carey, of the Local Government Board, with regard to an application from the local authority for sanction to borrow £10,000 for works of sewerage and sewage disposal. Mr. C. H. Johnson, C.E., of Sheffield, produced and explained the plans.

WAYSIDE NOTES.

SIR FREDERIC LEIGHTON'S address to the students at the Royal Academy had, said the *Times*, all the characteristic merits and defects of his various discourses upon art. "The style is too ornate. Too many topics are started without being discussed. The catalogue of names enumerated is too lengthy. Too much ground is touched upon to be occupied, except with a golden haze. Perpetually, on Saturday evening, his hearers must have mentally been plucking at his sleeve, and begging him to pause upon one of the peaks to which he had led them before winging his flight to another." Nevertheless, the reported speech must have proved interesting reading to many. That which is too highly condensed for an oration does not appear so in type, when we can ourselves rest awhile upon each peak, and gaze upon the prospect below, leisurely enjoying the evergreen fields of Tuscan art, and that of Florence in particular, the history of which, in the brilliant enthusiastic address of Sir Frederic, assumed all the charms of a romance.

I found time to run into the Royal Academy on Monday, and glance at the exhibition of the students' work. There was quite a gathering present, though, as usual, the room devoted to architecture did not attract many visitors. Perhaps they can hardly be blamed, in this instance. A *railway station* is not a subject that suggests to the average Englishman any great material loveliness. Visions of ungainly roofs, bulky iron trusses, and dull masses of blackened stock-brickwork come before one, looming out of clouds of steam from screeching locomotives. But to the professional man there was considerable interest in examining the designs of the competitors for the £200 Travelling Studentship. True, there was nothing that *quite* came up to Sir Gilbert Scott's work at St. Pancras; but then the R.A. students had no mammoth hotel to hide the ends of their station roofs. The inevitable vast iron roof proved a stumbling-block to all the competitors. Try it how they would, it was a regular *bête noire*. It was amusing to notice the way in which they endeavoured to get over the difficulty. The successful competitor, Mr. R. W. Schultz, had compromised matters; the author of a very creditable Grecian-looking design hid it with a pediment; while many others had openly confessed it, and endeavoured to make a thing of beauty of its ungainly wheel-like framework of iron and glass.

The problem is not a new one; but it still lacks a satisfactory solution. A big hotel has smoothed matters for the architects of most of our great London termini. As regards the *plans* of the competitors for the Travelling Studentship, many of the designs were conceived without regard to that daily morning and evening rush which is the chief feature of all great railway stations. I should say most of the competitors had never had a season ticket on any of the London trunk lines. In spite, however, of this insufficiency of points of egress and ingress, there were many redeeming features in the designs. Moreover, it was rather a thankless task for the competitors. Indeed, it was a very curious subject. Few architects are called upon to design railway stations; and, according to Mr. Ruskin, their services should not be required on buildings where rush and hurry is the order of the day—a view, however, from which I beg most respectfully to differ, having regard to the beautiful (!) specimen of railway station architecture at London Bridge, S.E.R.

So the old stones of Temple Bar are going into the country for a change of air! Who would have thought the venerable gate, which for so long marked the City boundary, would one day be re-erected in the park of a successful London brewer? It is now just about ten years ago that the Griffin usurped the place of the arch which Sir Christopher Wren erected in 1670-72. But softly! Let us not loudly mention Sir Christopher's name in connection with the old Bar. The shade of Inigo Jones might be upon us, with an indignant protest that, in the year of grace 1636, *he* prepared a design for a new Temple Bar—the said plan being still extant—which, to his exceeding chagrin, was never carried out. Looked at in the light in which the late Mr. Jones may be supposed to have regarded the question, it would appear that, *seniores priores*, Inigo should have had the job. Still, there is some consolation for the Jones family, in knowing that their illustrious namesake produced, or has the credit of having produced, a charming riverside water-gate. The authorship of the Adelphi edifice is still an unsettled point, is it not?

"The Metropolitan Board of Works Theatres Bill" was submitted, in draft, to the Board last Friday. It does not appear to have met with the approval of London theatrical managers. We cannot, however, express surprise at this, as the passing of the Bill would, it is hoped, at once put an end to many of their expedients for house-packing. First and foremost, I would recommend to the notice of the authorities the highly dangerous practice of fitting up hinged seats over stepped gangways, so common in many theatres, at least in inferior parts of the house. But this fact only makes the practice the more fraught with danger, as in such places there is the greatest rush in cases of panic.

Mr. Ralph Nevill's lecture at the R.I.B.A. did not seem to meet with the universal approbation of his audience, in spite of the many suggestions contained in it; so we may look for some heated discussion on Feb. 6, till which date comment on Mr. Nevill's paper is adjourned.

The suggestion made by Mr. Nevill that the *ellipse* would furnish the best form for the plan of a theatre staircase, does not seem to me a very practical one. Such a feature may be made very handsome, architecturally, as we may see in Mr. Waterhouse's beautiful marble staircase at the National Liberal Club*; but, as Mr. Emden said, there would be many objections to its employment for theatres. Besides the one he particularly mentioned, there would be a fertile source of danger in the fact that the treads are of ever-varying breadth. Consequently, in a struggling crowd, numerous persons would lose their foothold and stumble, since many would never know for certain where to put their feet down. This objection is magnified when we come to consider that the weaker individuals would be pushed about from side to side of the staircase—from narrow tread to broad tread, and *vice versâ*.

This question of theatre staircases is very interesting and important; and it is to be hoped there will be some valuable suggestions made at the adjourned discussion. While I think Mr. Nevill's elliptical staircase is bad, I cannot bring myself to like Mr. Emden's straightaway flights. A certain number of landings must surely be beneficial; as, also, a change of direction to prevent over-crushing. The weight of a struggling, pushing crowd must be enormous, and it can only be counteracted by a change in direction; but there ought to be something that should plainly indicate the direction to be taken. The tortuous "rat-hole" staircases of the average theatre gallery are the class to be avoided; but it is possibly in a happy medium between this type and the straight fore-and-aft kind that the most practical theatre staircase may be found.

I have to confess that I only saw the marble staircase at the National Liberal Club a day or so back. What a little gem it is! Of course, we ought to discount somewhat from our impressions as to the architectural merit of the composition for the fact of the exquisite nature of the materials employed in its construction. But even if we do, and imagine the staircase to be executed in plain stone and brickwork, it would still be a beautiful object. As it is, in all the glory of its many-hued marbles, it is certainly one of the loveliest things of its kind that one could expect to see. By the bye, it may be entertaining to the reader to know that I was recently most seriously assured that Mr. Waterhouse had taken the idea for the beautiful *faïence* work at this building from a certain miserable little piece of work of a provincial architect!! Bedowell-joggles!!! Happily I recovered the shock to my nervous system.

* This is not a true ellipse, but sufficiently like one in general appearance.

I attended the meeting of the Society of Architects last Tuesday. The paper by Mr. J. Leaning was of a most practical nature, as the reader of this week's "B. N." may judge for himself. The lecturer's genial manner made it quite a pleasure to listen to his discourse on scales, drawings, contracts, p.c. values, &c. Unfortunately, the miserable wet weather caused the attendance to be rather small. Nevertheless, there was an interesting discussion of the paper, and we had a few "wise saws and modern instances"—one of the latter, about a Scotch architect who adopted a ⅛ scale because he did not wish the contractors to measure from his drawings, did not seem to me to show any great wisdom on the part of the worthy Scotch gentleman. Surely, ⅛ scales are not so rare that a contractor cannot obtain one for love or money? Perhaps the architect inserted a clause in the specification that "No ⅛ scales were to be brought on the job." (!)

I fear your correspondent, Mr. H. L. Field, must make the most of the days that remain in which a little of the old work is left at St. Alban's. Protest seems futile, or there would be a rich field for the operations of the S.P.A.B. in protecting the stones of the venerable Hertfordshire abbey.

GOTH.

THE DOORWAY OF SAN PETRONIO AT BOLOGNA.

THE most recent addition to the Architectural Court at the South Kensington Museum is a plaster cast of the central western doorway of San Petronio, at Bologna. This church is a favourable example of the red-brick Gothic architecture of Northern Italy. It is the largest edifice of the kind in Bologna; but even in its present extent it is little more than half the length originally intended — 385ft. as against 750ft. in the first design. The church was founded in 1390, in honour of San Petronio, the first bishop, and the great doorway was executed by Jacopo della Quercia, in 1425; the architect of the building was Antonio Vincenzi. The vast size of this doorway has needed all the available wall space in the great Architectural Court, and the work forms a fitting pendant to the "Puerta della Gloria," of Santiago di Compostella, the famous portal of Mateo, on the other side of the Court.

Surrounding the arch from San Petronio are 32 half-figures of patriarchs and prophets, and on the imposts carried across beneath the arch are statues in full relief of the Virgin and Child, San Petronio, and San Ambrozio. In the architrave are five subjects from the New Testament, treated as bas-reliefs, and a similar number of subjects from the Old Testament, from the Creation to the Deluge, occupy the pilasters on either side. Vasari tells us that the artist devoted twelve years to the execution of this work, and that its completion filled the Bolognese with astonishment. The proportions of this magnificent doorway are somewhat marred by the scale of the plinth mouldings, which are carried across all the lines of the arch, and which, though well adapted to the entire façade, seem unwieldy when taken in connection with the entrance above. Moreover, the great height of the arch renders it a matter of difficulty to examine the figures of the Virgin and Child, and companion Saints, and the fine bas-reliefs in the frieze. It is said that Della Quercia has introduced his own portrait among the patriarchs, and that the figure in the archivolt wearing a chaplet of oak-leaves is the one in question. This splendid piece of casting has been executed for the museum by Lelli, of Florence, at a cost of £875, which compares very favourably with Brucciani's work at Santiago, which cost the Government £2,300.

Mr. Thomas L. Watson, F.R.I.B.A., of Glasgow, read a paper on "Fire Prevention and Exits from Public Buildings" before the Architectural section of the Philosophical Society of Glasgow on Monday night. We regret that pressure on our space prevents us from giving this week the paper, which referred to the points that should be kept in view with reference to safety in designing a theatre, and to those particulars in which, in Mr. Watson's view, the designer should be controlled by regulations.

The trustees of St. Leonard's Charity, Newark-on-Trent, has elected Mr. George Sheppard, the borough surveyor, as their surveyor.

WESTERN ASSOCIATION OF AMERICAN ARCHITECTS.

THIS flourishing Association of American Architects held its fourth annual session at the Grand Hotel, Cincinnati, O., in the third week of last month. At the opening meeting on Wednesday, Nov. 16, Mr. John W. Root, president, delivered an inaugural address, in which he remarked: "Idea is the crying need of our modern architecture. In England, if we may judge by the illustrated periodicals, architects are pitiably fortunate in having so far passed us as not only to be sadly lacking in ideas, but to be utterly unconscious of their imbecilities." The annual report referred to the movement now in progress having for its aim the establishment throughout the States of a uniform form of building contracts, to which we have referred elsewhere, and added: "At the Convention of the American Institute of Architects, held at Chicago last month, a committee was appointed, with instructions to meet a corresponding committee, to be appointed by the Western Association of Architects for the purpose of determining, if possible, a practicable plan for consolidating into one body all the architectural associations of the United States. It is the opinion of your Board of Directors that such consolidation would be of the utmost value to our profession, and it recommends the appointment of such committee." The report of the committee on the organisation of State associations showed that such associations had been formed at Nashville, Tenn., Milwaukee, Wis., Birmingham, Ala., Louisville, Ky., Detroit, Michigan, Rochester, N.Y., and New Orleans, La. Regular meetings had been held in all States but Indiana, and the committee recommended that the association in that State be abandoned. Mr. Louis H. Sullivan, of Chicago, then read the report of the committee on a standard of professional requirement. The committee proposed that the policy of the Association should be broad and democratic; that it should not set up factitious barriers against those who ask for admission; that the Association should seek to count among its members every thoughtful, earnest, ambitious man in the profession; that it should desire its strength and stability to be derived from the standing and capacity of the average man; that while welcoming the fervour of youth, it should cherish the honourable record of old age; that, above all, it should not place its standard for admission higher than it was itself prepared to exemplify. It was assumed as a paramount consideration that the applicant's record, were it short or long, should prove honourable; 2nd, that he evidenced fair artistic, constructive, or executive skill; 3rd, that his admission should necessitate an expressed pledge upon his part to sustain by individual effort a sound standard of professional bearing. The committee believed the time was now ripe for the promulgation of a code of ethics which should define a desirable and practicable relationship of the members of this Association to each other, and to the incorporate body: a code which should indicate the degree and nature of the self-respect and good faith of this Association. They therefore earnestly recommended to the Association that a committee be appointed to prepare such a code, and that its report be considered at the Convention of 1888. The committee further recommended the following form, for application-blanks, which may be found of interest to the councils and committees of English architectural bodies:—

——, 188—.

To the Board of Directors, W. A. A.:—

My full name is ——
My business address is ——
The name of my firm is ——
I have practised the profession of architecture for —— years.

The accompanying photographs (unmounted), numbered respectively 1, 2, and 3, show completed buildings erected from my plans and under my supervision.

No. 1 is a [here give general description of building, giving also name and address of owners and contractors.]
No. 2, do.
No. 3, do.

The accompanying letters, numbered 1, 2, and 3, are from the respective owners of the above buildings, and endorse my character and proficiency.

We, members of the W. A. A., hereby endorse Mr. ——. ——'s application for membership. We know him personally; we believe him to be worthy of membership.

——.
——.
——.

Applications are to be considered by the Board of Directors, who will vote "yes" or "no" by letter-ballot, of which the following is the draft recommended:—

Office of Secretary W. A. A., —— ——, 1887.

DEAR SIR,—Please vote by striking out the alternative word under the heading "vote," and return this sheet to me at your earliest convenience.

Vote.	Applicant.	Lay Endorsers.		Endorsing Members.	
Name.	Address.	Name.	Occu. Address.	Name.	Address.
No.	Yes.				
No.	Yes.				

——, Secretary W. A. A.

By order Board of Directors

——, Chairman.

The report was accepted.

The following resolutions were offered by Mr. Louis H. Sullivan, of Chicago, and adopted:—"That the Board of Directors be empowered and instructed to proceed hereafter in matters of election to membership, upon the basis of the report of the Committee on Raising the Standard of Admission of Membership. That a committee be appointed to prepare and submit at the next annual convention a Code of Ethics." The committee on a "Uniform Contract for Builders" recommended a uniform contract, but not a uniform specification. A committee was appointed to confer with the committee of the American Institute of Architects on the architectural consolidation of all existing societies, to make a report in detail for submission to all members. New officers were elected as follows: President, Sidney Smith, Omaha; vice-presidents, J. F. Alexander, Lafayette, Ind., and W. C. Smith, Nashville, Tenn.; treasurer, Samuel A. Treat, Chicago; secretary, Normand S. Patton, Chicago; directors, John W. Root, J. J. Flanders, Chicago; G. B. Ferry, Milwaukee; C. F. Schweinfurth, Cleveland; W. R. Forbush, Cincinnati.

SIR FREDERIC LEIGHTON ON TUSCAN ART.

AFTER the distribution of the prizes on Saturday night, the President delivered his biennial address, taking as his subject the art of painting as developed in Tuscany, which he remarked presented to us the most homogenous and comprehensive image of Italian culture in all its aspects from the 14th to the 15th Century. In his two previous addresses to the Academy students, Sir Frederic Leighton reminded his hearers that he had surveyed first the evolution of art in Egypt, Assyria, and Greece, and, secondly, its development in Etruria and Rome. In art painting was as characteristically an Italian form, as sculpture had been the pre-eminent expression of the genius of the Greeks. The President glanced at the human material on which this Tuscan art worked, and at the evolutions which marked the progress and development of the human race during the eight centuries between the fall of Imperial Rome and the rise of the Renaissance movement, pointing out that all the invaders of Italy, with the exception of the Saracens and Normans, who came by sea, were hordes who poured into Italy over the Alps, and the traces of whatever modifications the Italian races underwent must therefore be sought for chiefly in the northern and central portions of the peninsula. Rome was indeed a marked instance of the persistency of racial characteristics. Unconquered by the Lombards, occupied for a short space only by the Goths, strengthened by the influx of Italian refugees, Rome sustained little modification in the characteristics of her inhabitants, and the old sterility endured also in the things that concern the graphic arts; and even in the days when enthroned once more, Rome wielded the sceptre of the Christian world, when she gathered within her walls all that was great in art and letters, no solitary flower of native genius rose to grace her name, unless the word genius may be used in connection with the name of that brawny and prolific plagiarist of Raphael, Giulio Romano. Another instance of heredity, the President continued, is offered in Tuscany. Her race did not escape the alloy brought by foreign immigration. Nevertheless, while in the field of art the new amalgam produced an infinitely nobler and more exquisite flower than had grown on her soil in the old Etruscan days, the two distinct elements in Etruscan art—one delicate and graceful, the other harsh and almost Assyrian in its rudeness—assert themselves curiously in the art of Christian Etruria. Meanwhile, however carefully we may seek in the history of a people, the fecundating or the sterilising influences of certain sets of conditions, the source of the artistic gift, the secret of its permanence or its periclitation, will ever remain obscure. Of which obscurities here are two illustrations: The Ligurian was not an artist, the Venetian was; who shall say why? Again, what artist of really conspicuous mark have the two Sicilies sent forth? None, absolutely none; for we shall scarcely give that title to Salvator Rosa, a painter harsh and gloomy, like the Spanish rule under which he was born, whose painted work seems almost in scorn of the bright heavens under which he wrought. Let us now glance at the various formative influences under which Italian art rose and became supreme. The first which claims our attention, one common to all the nations of Europe, is the great spiritual revolution produced by the advent and triumph of the Christian faith. In the place of joy in the ideals of bodily perfection, loathing of the body and its beauty, a yearning for a life in which the flesh should be shaken off, became the moving forces that shaped its creations. The outward change was correspondingly complete. The forms of classic art were an embodied heresy; and, henceforth a gaunt ungainliness of form was to express the doctrine of the depravity of the flesh. A truer balance and a clearer insight was eventually restored; but the influence of Christianity did not cease to prevail in art in the form of the spirit of human sympathy. The growth of the free communities had, in the 13th century, a great influence on art and life, and before the middle of the 13th century these communities reached a level of prosperity and civilisation unknown in any other country. They were raising in their cities splendid edifices, sacred and civil, public and private, and carrying out great engineering works in their subject territories. And as in external dignity of life, so also in letters and art, they were in advance of the rest of the world. Among these young commonwealths, Florence was the most conspicuous. In the general stir of bracing civic life the genius of the Florentines had expanded on every side. In art, Andrea called Pisano, though not a native of Pisa, Arnolfo di Lapo, Cimabue, Giotto, and a host of others placed within the 13th century the name of Florence on a pinnacle from which it has not been dethroned. But the days of golden freedom were not of long duration in the cities of Italy, and by degrees these communities fell, one by one, under the rule of despots who, by prowess or by craft, or both, had seized the reins of power. This span of Italian history contains, then, two epochs—that of the republics and that of the despots; but changes not less momentous and far-reaching marked the domain of art and letters. The period embraced between the close of the 13th and the first quarter of the 16th century falls into three distinct divisions:—The first is the age of Dante, Petrarch, and Boccaccio, an age of creative production; the second, the age of the first triumphs of the humanists, one of reception and assimilation; and the third, ushered in by Lorenzo Magnifico and Poliziano, once more a period of productiveness, spontaneous and national, but bearing the stamp of the revived spirit of antiquity. To this revival of the spirit of antiquity the name New Birth, or Renaissance, is given; and, as this great intellectual revolution profoundly affected the course of Italian art, we will look at it first for purposes of future comparison, in its bearing on literature. The Renaissance movement is the result of two distinct currents of force. One was the spirit of intellectual revolt against the bonds of scholastic theology, and an impulse to reassert the dignity of man and to rehabilitate the world, and the other a new-stirred consciousness of a great intellectual inheritance. The general course of intellectual development which marked this Renaissance movement out is reflected in the development of art during the same period. The production, both in sculpture and painting, of the middle period of the 13th century has a character of transition. In painting, the works of Cimabue and of Duccio are still impregnated with the

Byzantine spirit, and occasionally reveal startling reminiscences of classic dignity and power. In sculpture, the handiwork of Nicolo Pisano is full of the amplitude, the rhythm, the virility of classic art. It contains the tokens of a new life in art, but little sign of a new artistic form—it is not a dawn; it is an after-glow, strange, belated, and solemn. In the art of Giotto and the Giottoists the transformation is fulfilled. It is an art endowed with an exquisite instinct of the expressiveness of form, but untrained in the knowledge of concrete facts. Within the outline of these general characteristics individuality found sufficient scope. Local particularities of temperament were reflected in local artistic production; in the work of the Florentines we trace that grave sobriety which so strongly marked them in the early days of their republican freedom. Among the Siennese, on the other hand, the love of splendour and luxury peculiar to them translated itself in the gay profusion of gold adornments which, in their pictures, bespangled and enriched the gorgeous raiment of their virgins, saints, and angels. The main external characteristics of this early phase of art, however, are a keen sense of the expressiveness of form, which translates itself in beauty and flow of line, ignorance of the facts of nature resulting in drawing empty as well as inaccurate, and a complete indifference to landscape, with which it deals symbolically rather than by imitation. Soon, however, the agencies which were at work in the world of general culture made themselves felt also in art. Of ancient painting, nothing, of ancient sculpture little only, was before the artists. And so it happened that artists were compelled to go to the study of nature. Another feature of the period was the free and unchecked development of the individual. Accordingly, the study of the individual forced itself upon the artist, and the acuteness of observation, innate in the Tuscans, became manifest in a marvellous subtlety in the rendering of individual character. Such portraits as those of Mellini and Palmieri, the medals of Pisanello, and the frescoes of Massaccio and Ghirlandajo will at once occur to you. Whether they use the pen, the pencil, or the chisel, the Florentines of the Renaissance are unsurpassed in their vivid portrayal of individual men. In its turn the scientific spirit took possession of the arts. Anatomy was pursued with zeal. Perspective, too, was keenly studied—a science especially indispensable to men whose love of architecture as an adjunct to figures amounted almost to a passion, and was in great measure the outcome of the haunting impression of architectural grandeur produced in them by the sight or by the accounts that reached them of the stupendous ruins of ancient Rome. And in the train of perspective the cognate mysteries of foreshortening claimed their votaries and exercised a fascination of which, indeed, the results were sometimes not a little ludicrous. By the side of this scientific fever the joy in re-discovered nature manifested itself in a new delight in landscape. Thus to Tuscan artists the new movement brought the love of nature and the light of science. While the revived classicism for some considerable period affected but little the outer form of their art, it largely modified from an early date the subject matter with which artists dealt; but under Tuscan pencils pagan themes gradually assumed a thoroughly changed complexion. But the action of this complex movement on artistic development varied in its conflict with the Mediæval spirit according to the human stuff on which it worked. The various operation in the province of art of the two main motive forces of the Renaissance may be best illustrated by reference to the work of three typical artists—Leonardo da Vinci, Raphael, and Michael Angelo. Of the scientific impulse we see the fullest expansion in that miracle of many-sidedness. A never-sated hunger for knowledge in every form, a desire ever burning to lift up the veil from every secret of creation, possessed and marked him through life. The hidden structure of the bodies of men and of animals, the structure of plants, the ways of rushing waters and of wandering winds, and every riddle in the book of nature were objects of his ardent curiosity and unwearied study. But we cannot, in this strange man, separate the scientific investigator from the artist. The same haunting sense of mysteries unsolved led him now towards scientific prophecy and now to the creation of a type of human beauty more subtle and complex than any the world had seen before. The influence of the revival of classicism, both in its spirit and as a form of æsthetic expression, is seen at its meridian in Raphael. Whatever was best in the classic spirit was absorbed and eagerly assimilated by him, and imparted to the work of his best day that rhythm, that gentle gravity, and that noble plenitude of form which are its stamp, and proclaim him the brother of Mozart and of Sophocles. In these two artists we see the afflatus of the Renaissance in two distinct forms—in its avidity of research with Leonardo, in its classic serenity with Raphael. The greatest, far, of all three, on whom, as an artist, the old world had no direct hold or influence, though it coloured his intellect by blending into his Christian orthodoxy some tinge of Platonic mysticism was Michael Angelo. His contact with the Renaissance as an artist is traceable only in the scientific spirit and its interest in man; for to the artist Michael Angelo, who saw in the human form a dim reflection of the Divine beauty, man was the all-absorbing and exclusive object of study. All else was indifferent to him; to him a plain mass of green or grey sufficiently signifies the earth. Giotto himself is not more scornful of its charms. And this is to be noted of Michael Angelo as distinguishing him from Raphael—the type of human form which he lifted to the fullest expressional force is the last development of a purely indigenous conception of human beauty, whereas the type which we know as Raphaelesque is a classic ideal warmed with Christian feeling. Sublimely alone as Buonarroti's genius stands, towering and unapproached, like some unscaled, heavenward, mountain peak, it does but mark the highest summit reached, in the magnificent continuity of its evolution, by the purely native genius of Tuscan art. In his grave the art of Tuscany was buried; no flower grew over it. When he died in 1564, one Florentine of genius was still alive—wild Benvenuto, to whom a short span was yet allowed. For a few years longer a Venusti, a Bronzino, a Daniele da Volterra remained to show how dull a thing art may become when the soul has gone from it and rhetoric replaces feeling. For a few years yet good Giorgi Vasari, king of chroniclers, strutted in garments which he believed to be his master's; and then final night closed over the art of Florence. The light of Italian art passed from the valley of the Arno to Venice. One last point, and one not without interest for artists, remains to be briefly noted. Whatever noxious influences crept in under the cover of the humanistic movement fastened far less on the art than on the literature of Italy. The profession of the great mass of the humanists, said the president in his closing remarks, in the days of the middle life of Michael Angelo, had become a synonym for corruption. How different a spectacle is afforded to us in the field of art! The Renaissance was to it a new birth, indeed, and profoundly affected it; but affected it in the main to its strengthening—never to its ethic degradation. The material on which the new spirit impelled it to work often lacked the moral elevation of that which had inspired the Art of Giotto and of Lorenzetti; but how dainty and how decent is the mirth, how pure and free from every taint the joy of life appears! I call up before my mind, in bright procession, the profuse treasures of Etruscan art, and in vain I look in all that varied pageant for one unwholesome work. Rather, I see in it dignity, throughout unfailing; often a vein of sadness; here and there, among the most impressive of its triumphs, a male severity and a sublimity of strain such as had not winged Italian poetry since the death of Dante. These things I see in Tuscan art, of which it may be said, as truly as the art of Greece, that whatever was highest and purest in the spirit of the people from which it flowed found in it a faithful image and an adequate expression. Let it be our care, my young friends, that one speaking at some future time of this our English art may say a like thing with equal truth.

A large Odd Fellows' Club is to be erected in the centre of Oldham, from the plans and under the superintendence of Mr. A. Banks, architect,

ELLIOTT'S "PERFECT SIMPLEX" METAL WEATHER BAR.

MR. SAMUEL ELLIOTT, of the Albert Joinery and Moulding Mills, Newbury, has brought out a metal weather bar, which is certainly simple, and, we think, is as nearly perfect in its action as may be; at any rate, it is more efficient than any other we know of, and should certainly obviate the principal objection to the use of casements. The lower bar is in sectional shape something like the letter L, and is screwed into a groove formed in the sill, the highest side of the bar being on the outside; or it can also be screwed on to an ordinary sill without forming any groove at all. The bar is pierced in one place at the bottom, and a hole is also bored through the sill to carry off the condensation or other water that may accumulate in the bottom of the bar. The top bar is somewhat similar in shape, but of a smaller section, and is screwed into a rebate formed on the outer edge of the casement. This bar is also pierced to convey the condensation down through the bottom rail. The lower external angle of this bar is bevelled to form a drip, which is fixed flush with the bottom edge of the rebate in the sash. The long edge of the bar fixed on the casement laps on the top of the long edge of the bar fixed in or on the sill, and forms the outside joint of the casement; consequently the short edge of the small bar touches the inside face of the sill bar.

MARBLE AND MARBLE-WORKERS.*

THIS little book will be of real service to architects and builders. There is no other like it in existence, and Mr. Lee has conscientiously expended a good deal of labour to make it complete and accurate. In the course of his business he has visited the principal European quarries, and has become practically acquainted with the various methods adopted for the raising and working of the material. Early in the present year he contributed several papers upon this subject to the Building News, which our readers will remember. These form the basis of the present work, which is a really valuable little addition to the technical literature of architects and masons.

ART WORKMANSHIP COMPETITION.

AT the rooms of the Society of Arts an interesting exhibition of decorative painting, *repoussé* and chased work in metal, ornamental bookbinding, and painted glass is to be seen. Messrs. Powell and Sons, Whitefriars, obtain the second prize for a painted glass panel of "Music," from a design by Mr. Henry Holliday. The figure of "Music," with wreath, is gracefully drawn; the drapery, by John E. Penvarden, very delicate in tint, also the lines; and the background, by A. Lawrenson, very effective in design and colour; the blue sky and foliage at the back of the head of the figure being an appropriate ground to the tender and expressive face. Alan Cooper, of Birmingham, shows a well-treated head-light subject, "St. Mary," and the Glass Decoration Company a window screen, crystallised by W. R. Pullen, and painted, designed, and fired by Birch. In the glass-blowing class are some very choice specimens of Venetian character, including some very beautiful lead glass opal vases, jugs, and dishes by workmen in the employ of Messrs. Powell and Sons. The first prize is won by T. Smith, W. France, and W. Watkins for some very delicate specimens of vases, with scroll and frilling, and a lead glass opal dish on scroll foot, tazzas of lead glass; the second prize, for a soda lime vase with scroll, is by J. Hughes. A. Johnston, and H. Hart.

The inlaid work is a large class. We see a lady's workbox inlaid with 16,000 pieces of different woods; another with 2,000 pieces of twelve different sorts. The third prize goes to T. Spalding for three table tops. The specimens of decorative painting on wood and other materials include a very tastefully designed piano-front in walnut, having a centre panel, with figures representing "Vocal and Instrumental Music." The figures are painted with considerable feeling and delicacy, and the colours are nice. Side scroll panels fill up the

* Marble and Marble Workers. By Arthur Lee. (London: Crosby Lockwood and Co.)

front. The artist is John Eyre, of Battersea, S.W. Jas. Law sends three panels of floral design, one of a sunflower on dark wood. H. Mennier, Chelsea, has an ornamental screen, carved and painted; and Cornelius Crane, Hull, a painted canvas screen of good design, in flat ornament, one of the best works of the class. We cannot admire the ten panels imitating inlaid woods; the motive is wrong, but as a work of artistic execution they are unsurpassed; they are sent by W. Oldfield, of Coventry, and are intended for room or furniture decoration. G. D. Sumpter's (Cricklewood) imitation of mosaic on marble is a wonderful example of engraving and painting. The colours are quiet, and the resemblance to mosaic excellent. As an example of imitation decorative painting on wood, the lacquer panel which takes the first prize, by Thos. W. Hay, Paddington, is very creditable. The panel is intended to imitate a Limoges enamel subject or medallion of Bacchus and the Tyrrhenians, the embossed framework and figures are in toned gold and imitation lacquer work. But why imitate Limoges or lacquer? We admire the artistic result, but not the imitation. A case of bookbinding, showing many ornamental covers, is of interest. The first prize goes to T. G. Cobden-Sanderson, Hendon, for "The Germ," bound in green morocco, with a rich floral design tooled all over it in gold. A binding in red morocco, tooled over with a gold device, and another in blue, are to be noticed for their elegant design and ornamentation. The second prize is awarded to T. Mäuller for "Mireille," bound in orange-coloured morocco, ornamented with a design in gold, with inlaid Venetian green morocco, in style of 16th century. The *repoussé* and chased metal-work forms another important class. A. Hubert, Chelsea, sends a very choice collection of specimens in silver and other metals, including steel *repoussé* plate for cards, head of Christ and four cherubs in steel, a *repoussé* panel for a Bible or prayer-book, and several other specimens. A first prize, too, is given to R. Holloway, Birmingham, for a capital of column in hammered gilding metal, showing considerable delicacy of handling, and we notice a *repoussé* curtain for fire-grate by W. Bullar (taking a second prize), and some very nice plaques and shields in brass and wrought iron, by Charles Letheren, of Cheltenham—one of them a plaque of "Lot's Wife." The exhibition is well worth a visit.

ARCHITECTS' AND BUILDERS' DIARIES.

NO architect or builder, we imagine, ever uses any other diary in his business nowadays than those published by Messrs. Hudson and Kearns, and the wonder is how we all got along before their introduction. We ourselves should miss the date-indicating blotting-pads more than any other office adjunct. These are so well arranged and so handy that one gladly commits to their keeping all memoranda with the certainty that in due time they will jog one's memory with the faithfulness and persistency of an alarum. The new issues for 1888 are in all respects worthy of their predecessors. For the first time we think the publishers fail to advise us of any change, and the reason, we honestly think, is that they have approached so near perfection as to render none necessary.

The day for holding the professional examinations of the Surveyors' Institute has been postponed from the 9th to 23rd of April next. Names of applicants must be sent in to the secretary before the 14th January next.

The Corporation of Rochdale have just completed considerable alterations and additions to a building (originally erected as a workhouse, but now not required for that purpose) purchased by them for an infectious diseases hospital, and have made ample provision for dealing with fever and smallpox cases. The work of conversion has been carried out from the plans and under the supervision of Mr. S. S. Platt, A.M.I.C.E., borough surveyor, Mr. W. Smithson, his chief assistant, acting as clerk of works.

On Monday, Col. Rich, of the Board of Trade, finally inspected the Pontypridd, Caerphilly, and Newport Railway, which is to be opened for passenger traffic to-day (Friday). The railway places Newport in direct communication with the coal and mineral fields of the Rhondda Valley.

Building Intelligence.

Bracknell.—The Bracknell Jublilee Memorial Hall was opened by H.R.H. Prince Christian on the 8th inst. This building has been erected by Messrs. Green Bros., builders, of Colnbrook, near Slough, from the designs, and under the superintendence, of Mr. J. T. Lawrence, architect, of Leighton Buzzard, Beds. The whole of the bricks were supplied by Messrs. T. Lawrence and Son, the noted T.L.B. rubbers being used for the gauged and carved work, and the walls faced with their dark red-brown pressed bricks, the gables and other parts being relieved with diaper and moulded bricks made by the same firm. The roofs are slated, that over entrance lobby having stamped copper hips and flat, with moulded curb, the copper work being carried out by Messrs. Braby and Sons, of Euston-road. The closets are fitted with "Jennings" pedestal vase closet apparatus, and the lavatories with marble top and patent valves. The whole of the building is lighted by gas, the fittings being made by Messrs. T. Brawn and Co., of Birmingham.

York.—Special services were held in the Church of Holy Trinity, Micklegate, York, on Sunday, in connection with the opening of a new chancel and vestry. The work has been executed from designs prepared by Messrs. Fisher and Hepper, architects, York, and the cost amounts to £1,800. The new chancel is built in the Perpendicular style, and is one of the largest in the city. The roof is covered with green Westmoreland slates. The walls on the exterior are faced with stone, and on the interior are plastered and coloured above the window sills, below which they are faced with dressed stone. The roof is of deal, stained dark, divided into panels by moulded timbers and plastered, and is supported by moulded principals resting on carved stone corbels. The vestry is on the south side, and the organ-chamber is built over it. The choir seats accommodate 16 men and 22 boys. The floor of the chancel is laid with encaustic tiles. A pulpit, executed out of the old oak from the nave roof, has been placed in the nave. The total increase of accommodation is 84 sittings.

CHIPS.

Mr. Charles Pring, builder and contractor, of Exmouth, met with a serious accident on Saturday afternoon. He is carrying out a large building contract at Sidmouth, and was going there to pay his men in a spring cart, accompanied by Mr. Hine, a stonemason, who is doing the ornamental stonework of the building. In going over Peakhill the horse ran away, throwing Mr. Pring out of the cart, when he received serious injury to his head and was rendered insensible.

A carved oak eagle lectern, a replica of one supplied to the English church at Neuilly, near Paris, has recently been executed for Tunstead Parish Church by Messrs. Jones and Willis, of Birmingham and London.

The Shrewsbury Town Council have applied to the Local Government Board for power to borrow £25,000 for carrying out a new scheme for improving the water supply of the town.

The Bradford Town Council has determined to carry out a scheme for supplying the electric light to the public buildings and to those firms in the business part of the town who require the light. The present expenditure for that purpose is limited to £15,000, and it is estimated that the cost to the private consumer will be just double the cost of gas. The electric cables will be laid underground.

A high-level water supply is being commenced for Brixham at the cost of the local board. Mr. Philip Hayman is the contractor, and Mr. William George the clerk of works.

The Smethwick Local Board has received and accepted (a motion of regret being passed) the resignation of the office of consulting surveyor from Mr. W. Harris, who has held that post for over ten years.

Following our example, the nucleus of a National Portrait Gallery for France is being formed in the Rue de Valois, Paris, by M. G. Castagnary, the new Director of Fine Arts. An endeavour will be made to bring together at least a thousand portraits of distinguished Frenchmen, and it is intended to hang them in a gallery of the Louvre.

Engineering Notes.

Society of Engineers.—The thirty-third annual general meeting of this Society of Engineers was held on Monday night, at the rooms of the society, 9, Victoria Chambers, S.W. The chair was occupied by Professor Henry Robinson, president. The following gentlemen were elected as the council and officers for the ensuing year, viz.:—As president, Mr. Arthur T. Walmisley; as vice-presidents, Mr. Jonathan R. Baillie, Professor Henry Adams, and Mr. Robert Harris; as ordinary members of council, Messrs. R. W. P. Birch, W. N. Colam, W. Schönheyder, W. A. Valon, C. Anderson, J. H. Cunningham, J. W. Wrestler, and J. W. Wilson, jun., the four latter gentlemen being new members of council; as honorary secretary and treasurer, Mr. Alfred Williams; and as auditor, Mr. Alfred Lass.

The Use of Concrete in Sacks for Marine Works.—At a meeting of the Royal Scottish Society of Arts, held on Monday, at Edinburgh, Mr. William Dyce Cay, C.E., gave a paper on the construction of marine works with concrete bags, and the plant used for their deposit. He noticed some previous cases of the use of sacking in the laying of concrete foundations. The use of sacking bags, however, had been first introduced by himself at the building of the Aberdeen breakwater. There the concrete bags had been dropped into position by means of a hopper barge. The barge was fitted with bottom doors. When in use, her hold was lined with jute sacking; the concrete was then filled in and the sacking sewed up. The barge was towed into position, the bottom doors were opened, and the concrete bags dropped down into position, fitting accurately over each other. The barge used at Aberdeen carried fifty tons of concrete, and barges carrying a hundred tons had since been used. The breakwater at Aberdeen had now stood twelve years, and it had been reported this year that it had required but £50 to keep it in repair since that date. Mr. Cay described also the dropping into the water of concrete bags and boxes or skips carried by cranes, in which the arrangement of bottom doors was the same. In the discussion which followed, Dr. Sang raised a question as to whether the different masses of concrete separated from each other by the canvas bags gave sufficient stability. Mr. D. M. Westland, C.E., answering, explained that, having had to take down a breakwater made of concrete bags, he had found the bags adhering very closely to one another, so that it was easier to break a bag through the middle than to separate the bags from each other. Some discussion took place as to whether concrete could be made perfectly watertight. Mr. J. Reid, C.E., said they had never succeeded in doing so. Mr. R. K. Miller, C.E., took an opposite view. He argued that it depended on the quality of the materials used.

A large block of residential flats is being erected by Messrs. J. W. Hobbs and Co., Queen's-buildings, Southwark Bridge-road, S.E., in Carlisle-place, Victoria-street, Westminster. The building is six stories in height, and has a frontage of 227ft., and is Classical in style, consisting of a central block and two end wings flanked by composition pilasters, and faced with malms and stone dressings. A large block consisting of about fifty flats, erected by the same firm on the opposite side of Carlisle-place, is now approaching completion, about thirty flats being occupied. The architect for both blocks is Mr. George Baines, 4, Great Winchester-street, E.C.

The Great Eastern Railway Company have under consideration the development of Bradwell-on-Sea, Essex, a small village on the south side of the estuary of the River Blackwater. It is 15 miles by road from Maldon, 6 miles from Southminster, the terminus of the new Dengie Hundred Railway now in course of construction, and only 5 miles by water from the proposed port of Colnemouth. The channel of the river is half a mile broad, with a high tide width of over a mile. Bradwell as a port would have an advantage over Parkeston and Harwich in being 20 miles nearer London.

The Aberdeen Harbour Trustees have adopted a report by Mr. Philip Messent, of Newcastle-on-Tyne, and will carry on the re-construction of portions of the graving dock by their own workmen, at an estimated cost of £4,400.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—A meeting was held on Tuesday evening last, the Vice-President (Mr. W. Doubleday) in the chair. A paper was read by Mr. Whitworth Wallis, F.R.G.S., on "The Temples, Forum, Theatres, and Tombs of Pompeii." The lantern views illustrating the lecture were of the most interesting description — temples, theatres, tombs, frescoes, statuary, &c., succeeded each other in an almost bewildering variety. The "City of the Dead" became, indeed, for the time a city full of life and vivacity. The draping of the statues which have been unearthed lately rivals those of the Early Greek period. A vote of thanks, proposed by Mr. W. Doubleday, and supported by Messrs. Newton and Victor Scruton (hon. sec.), was unanimously accorded Mr. Wallis for his interesting lecture.

Edinburgh Architectural Association.—At a meeting of this body, held on the 8th inst., Mr. John Wallace read a paper on "Italian Monuments." Reference was made to the Early Renaissance tombs of the 15th century, not only as being of singular interest from their intrinsic excellence and suitability for their purpose; but as throwing valuable light on the rise of Renaissance art, and the influence this department of design had on architecture proper. The Gothic tombs of the 13th and 14th centuries were next spoken of in some detail. The tombs of the Scaligeri at Verona were described as being of supreme importance, giving, as they did, dated examples of the best Gothic work during the whole time of its prevalence in Verona. The earliest examples of Renaissance tombs—those of the Quattro-cento period—were next treated, Tuscany being the home of their birth and most perfect development. The vagaries and bad influence on art of the Rococo School were then alluded to. Reference was then made to the modern Italian tombs, as exemplified in the Campo Santo at Genoa, regret being expressed that effort should be so misdirected; ignoble realism in the dexterous representation of lace and ribbons, and the trivial accessories of modern dress being aimed at, to the exclusion of the higher qualities of sculpturesque design. The value of a study of these ancient monuments was expressed with a view to improvement in this department of design in modern work.

Leeds and Yorkshire Architectural Society.—The annual dinner of this society was held on Monday evening in the Queen's Hotel, Leeds. Mr. C. R. Chorley, the president of the society, presided. "The Queen and Royal Family," given by the President, was followed by the "Clergy and Ministers of all Denominations," proposed by Mr. R. Benson Jowitt, to which the Rev. F. J. Jayne, the vicar of Leeds, responded. Colonel Wilson acknowledged "The Army, Navy, and Auxiliary Forces." The toast of "The Royal Institute of British Architects" was proposed by Mr. J. Murgatroyd. Mr. E. I'Anson, P.R.I.B.A., who responded, urged the necessity of architects joining the Institute. Mr. J. W. Connon, in proposing "The London Architectural Association and Kindred Societies," said that the Institute was rather wanting in energy and spontaneous movement. It was the figure-head of the profession. They had to look to the Architectural Association and local societies for movement and judicious agitation. Professor A. Barr proposed "The Leeds and Yorkshire Architectural Society," and Mr. G. Corson responded. "Our Guests" was proposed by Mr. W. H. Thorp, and the Rev. Canon Scott replied.

Manchester Architectural Association.—The last ordinary meeting was held at the Diocesan Buildings on the 13th inst., Mr. A. H. Davies-Colley (president) in the chair. The Rev. R. H. Snape read a paper on "Scotch Cathedrals." He prefaced his remarks by saying, as he had spent several of his earlier years as an architect, and had visited the whole of the English as well as the Scotch cathedrals, he claimed some right to speak on this subject. Our views of cathedrals must be very much modified when we come to Scotland, as they are, more correctly speaking, simply kirks, numbering in all about fourteen. Transepts, cloister courts, and crypts are non-existent except in a very few cases; towers and spires are also very few and very irregularly placed. The round arch is to be found in nearly every style, but the Perpendicular has hardly an example. The crypt of the Glasgow Cathedral is the finest in England or Scotland. The abbeys more than rival the cathedrals.

Society of Antiquaries of Scotland.—A meeting of this society was held on Monday night, Mr. Robert Herdman, R.S.A., vice-president, in the chair. The first paper was a notice of the ceiling of the painted gallery at Pinkie House by Mr. George Seton, F.S.A., Scot. After referring to the description of the painted hall as given by Billings, the author proceeded to describe the blazons and emblematical devices with their legends which remain upon the ceiling. He also referred to other examples of painted ceilings at Earlshall and Cullairney. A discussion on decorated ceilings followed, and Mr. Findlay recommended the subject as one which had not yet been treated systematically, and for which there was a large field of investigation open to those who might be induced to enter into it. In the second paper, Mr. James Macintosh Gow, F.S.A. Scot., gave notice of some cup-marked stones and other antiquities which he had investigated during a recent sojourn at St. Fillans. The third paper was entitled "Notes on the Trinitarian or Red Friars in Scotland," by Mr. Joseph Bain, F.S.A. Scot. The occasion of this paper was the recent discovery of a charter of Alexander III., confirming the foundation of Houston, a Trinitarian house, by Christiana Fraser, widow of Sir Rodger de Moubray, and Mr. Bain identified the site of this unknown monastery of Red Friars with the neighbourhood of the parishes of Athelstaneford and Prestonkirk in East Lothian.

York Architectural Association.—On Thursday, the 9th inst., in connection with this association, an address was delivered in the Church Institute, Lendal, by Mr. J. Wreghitt Connon, F.R.I.B.A., of Leeds, on "The Legal Registration of Architects." The chair was occupied by Mr. W. Hepper, president of the society. The lecturer said the desirability of bringing about the legal registration of architects was shown under the headings of how registration would effect architectural students, architects in practice, and the building public. Until the profession of architecture is placed under conditions identical with those now forming the medical and legal bodies, there is no probability of the universal education, from a technical point, of architects being attained; the power of compulsory examination being an essential precedent before students can be induced to undergo the preliminary training needful to competency in their calling. A discussion followed, which was taken part in by Mr. W. Brown and Mr. Yeomans. Mr. Hepper moved, and Mr. G. Benson, F.R.I.B.A., seconded, the following resolution:—"That this meeting of the York Architectural Association believes an Act of Registration for architects is an imperative need, and urges upon the Royal Institute of British Architects the desirability of giving the movement its countenance and support."

SCHOOLS OF ART.

Kendal.—On Saturday evening last the annual meeting for the distribution of prizes was held in the Town Hall, Kendal. The prizes were distributed by Mr. J. Cropper. The report showed that 132 students attended the school, showing an increase of 18 on the previous year, and that of 48 students on the year 1885. The work of the students done during the past year, a few specimens of which were on exhibition, showed a marked improvement on that of former years. The silver medal annually presented by the president, Earl Bective, was awarded to Frederick Wilkinson, he having been the most successful student of the year.

In the Chancery Division, on Saturday, a petition was presented by Mr. John Waddell and Co., contractors, for the appointment of a receiver and manager of the Scarborough and Whitby Railway Company. According to the petitioners' statement, Messrs. Waddell are judgment creditors for £148,000. The line was opened in 1884, and Mr. Justice Kay appointed Mr. B. L. Fernley, secretary to the company, as receiver and manager.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., and XII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—Pat. P. Co.—T. and D. P. Co.—C. L. B.—W. and J. R. H.—A. H.—G. and Co.—F. C.—A. and Co.—W. C. and Co.—H. G. S.

JAS. FASNACHT. (Better address your letter to our contemporary; we have no stomach for the task of criticising its eccentricities.)—CHAS. HUNT. (*Do* make yourself acquainted with the proposed Bill before criticising. A note to the secretary of the committee will remove most of your objections, which have been before dealt with in these columns, but which you attack *de novo* as innocently as possible.)—H. T. M. (No; they will be probably increased, and we do not see what you have to complain of. We have not decreased the lithographic plates, have we? We give you the others into the bargain.)

"BUILDING NEWS" DESIGNING CLUB.

W. B. (The size 14in. by 22in. for the sheets must be maintained. A pent roof means a projecting hood or oversailing roof to keep off the weather from those using the grindle-stone below.)—R. M. P. (There will be no living apartments in connection with the smithy.)—AN ACADEMY STUDENT. (The award of prizes for 1886-7 was published in the BUILDING NEWS for Oct. 28th last, and in the same article you will find a list of the subjects competed for, with the dates when the chosen designs were published in our pages.)

Correspondence.

ARCHITECTS', ENGINEERS', AND SURVEYORS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—With a view of clearing up an uncertainty which some of your readers appear to have with regard to the exact form in which the above Bill is to be presented to the House, will you allow me to state that since May last, when copies of the Draft Bill were sent to all the principal architectural, engineering, and surveying societies, and circulated generally, the Registration Act Committee has been engaged in considering the many useful suggestions made with the object of improving the Draft Bill that have since come to hand from all sides.

The Bill, therefore, which Colonel Duncan, C.B., M.P., has kindly undertaken to present early next session will embody such suggestions which appear to the committee to be improve-

ments, and calculated to benefit the public and the profession.—I am, &c.,

Edgar Farman (hon. sec.)

39, King-street, Cheapside, E.C., Dec. 13.

Sir,—Referring to the Draft Bill, I think that the following modifications might be made with advantage :—

1. That persons who have been members of any of the bodies mentioned in Schedule A, but who from removal or other cause have withdrawn their membership, should be entitled to register.

2. That provision should be made for those who have commenced practising at any time up to the passing of that Act, and not previously to 1882 only (but are not qualified under any of the heads), as it is unlikely that Parliament will pass a Bill excluding them.

3. As the Bill is at present drawn, I take it that an applicant for registration who practised prior to 1882 (not being a member of any of the bodies named in Schedule A) will, on being registered, be required to pay a fee of £5.

This is manifestly unfair, as any member of the societies will be admitted on payment of £2 only. The subscription for membership in some cases being only 5s., why should a practitioner (previously to 1882) be mulcted in the sum of £2 15s.?

4. That after the passing of the Act no person shall be qualified for admission except by examination, as the number of years' assistantship specified in Clause C is no guarantee of proficiency to practise.

5. In my opinion the Bill is weak on the question of pupilage ; and a clause should be inserted limiting the number of pupils to two for each registered practitioner, as in the legal profession.—I am, &c.,

Harrogate. F. Bagshawe.

THE DRAUGHTSMEN'S PROVIDENT SOCIETY.

Sir,—May I ask the favour of your space for the purpose of informing your readers that the committee have now finished the first stage of their labours, and made arrangements for calling a general meeting at St. James's Hall on January 9th? They have now provided for forming a fund, out of which it is proposed to lend to members out of employment sums of money up to £10, free of interest.

I would beg to urge upon draughtsmen the desirability of supporting this movement, and of communicating with the hon. sec., Mr. G. A. T. Middleton, St. James's Hall, Piccadilly, W., and attending the general meeting, so that the efforts of the committee may be crowned with success. It is desired to make the society entirely mutual and self-supporting, and the committee in framing the rules have always borne in mind that it is to be a society managed entirely by draughtsmen for draughtsmen. Thanking you in anticipation—I am, &c.,

Walter J. Kenny.

11, Southampton-street, Strand, Dec. 12.

ST. ALBAN'S ABBEY.

Sir,—I cordially share W. Field's hope that some influential effort may be made to stay the destroying hand of Lord Grimthorpe ; but I much fear his lordship will yet gain the unenviable notoriety of being the one man in England who has both the inclination, the means, and the power to exhibit his self-assumption of practical and artistic knowledge at the expense of one of our grandest national monuments.

But where is the power to be found to resist the enemy? Where are the wealthy and influential committee who were originally responsible for the work? Have the Bishops, the cathedral dignitaries, and the clergy of the diocese no interest in the church? Cannot the law for the preservation of ancient monuments be put in force?

I don't know ; but this I do know, that his lordship has enough money to ruin and to rear.

Fortunately, St. Alban's Abbey is very large, and we may hope, unless Lord Grimthorpe lives to the age of Methuselah, to have some fragments left to tell of its ancient glory, and to save the necessity of changing its name to "Lord Grimthorpe's Folly."—I am, &c.,

Arthur Baker.

14, Warwick-gardens, Kensington, W.

Sir,—Some few years back the tower of St. John's Church, Chester, fell through want of funds. It had long been known to be in a state of decay ; but there was no "riche amateur" at hand to repair it. Your correspondent seems to forget that the same thing would have happened to the south wall of the nave of St. Alban's if Lord Grimthorpe had not repaired it. The shoring supporting the wall had been up for years, and was in a perfectly rotten state.—I am, &c., Charles F. Moxon.

Sir,—Everybody who has seen St. Alban's lately will confirm the truth of every word Mr. Field says in your last issue. There seems to me something like a conspiracy to let Lord Grimthorpe do as he likes, and I do not think posterity will entirely saddle him with the responsibility. "The fact is," said one who had something to do at St. Alban's some time since, "none of us *dare* remonstrate, though we see the mischief that is being done. We are all powerless—not even excepting Mr. Blomfield or Mr. Gibbs, or we should be all kicked out together by Lord Grim." Is this true?—I am, &c.,

One Who Wonders At It.

ASSISTANT SURVEYORS R.E. DEPARTMENT EXAMINATION.

Sir,—In answer to "Assistant Surveyor's" remarks in last issue, I may state that when writing my first letter I was not in the least bit doubtful as to the meaning of "surveyor" as applied to those in the R.E.D. I may also state that I have had over fifteen months' experience of the working of the department.

The principal work done by these surveyors is the checking of quarterly and intermediate requisitions—these are for small jobs, repairs to floors, and such like, and are in the form of bills of quantities. They have also the work enumerated by "An Assistant Surveyor" to do. "Assistant Surveyor," however, has not given all the duties, and as well as I can remember from the regulations, the Commanding Royal Engineer can require the surveyor to do any work in connection with the department that is of a clerical or professional character.

Though land-surveying and levelling are not specially mentioned in the regulations, they are to be implied, or else how can a surveyor draw his plans and designs—for instance, a rifle range on steep ground—unless he does it by guesswork?

The suggestions of "Norseman" are most valuable. A surveyor ought rather to know the difference between white deal and red pine than that between a moulding of the 13th and one of the 14th.—I am, &c.,

Prospero.

P.S.—In my first letter, the words "of surveying" should come after "acquaintance."

SALISBURY CATHEDRAL,

Sir,—"Belfastiensis" may rest assured, I think, that there is no change since Price's or Wren's time, the direct-plummet experiment being frequently repeated. I was told, the last time I was there, it had been tried the same week ; and as both the vaulting and all floors above have central openings, there can never be any difficulty. The marks on the pavement are a small brass plate inscribed, "The Centre of the Tower" (*i.e.*, centre of plan), and an octagon of 4ft. diameter, said to be outlined from the capstone, the centres of the two figures being, I believe, 29·4in. apart, as Francis Price's detailed measures require, though he strangely twice gives, instead of this, "two and twenty," or "22 inches and three-eighths." Sir Christopher had plainly erred, as he shows, about the sinking of the legs, which does not account for a sixth of this decline. Indeed, the centre of the vaulting (at 88ft.) being not quite an inch W.S.W. from that of the ground plan, would not throw the top 5in. in the same direction, whereas it is $\sqrt{(27{\cdot}5^2 + 17{\cdot}5^2)} = 32{\cdot}6$in. S.S.W., according to Wren, and I see no inconsistency between this and Price's measures. The latter professedly apply to the "capstone, 387ft. from the ground" ; but the ironwork protrudes 13ft. higher, and being very visibly more inclined than anything below, may well lean the additional 3·2in. It is part of a bar, according to Price, 50ft. long, and might, I should think, be straightened by lighting a fire above the stone, almost without scaffolding. The whole finish, however (a vane, and above it the exact inversion of a pawnbroker's sign), is very unworthy the building. A vane is of little use at a height where the direction of wind often differs from the undercurrent, and one with fixtures above it cannot be hung the best way.

The present one is slightly better shaped than that represented by Price ; but a floriated metal cross, as large as on the Rhine spires, would be the only worthy finial. The iron riggings, as of a masthead, can only be meant, I suppose, to assist a climber, and would not be needed were there no vane to be oiled. All the top masonry should be held firm enough by the central iron alone. Price represents the weather-door only 3ft. high, and its sill fully three above the third band of panelling, on which band the present door immediately opens. That is the only difference now apparent from his engravings.

As the decline may be said to consist practically of merely curvature in the spire itself, I cannot but think this may some day be straightened, as factory chimneys have been, by drilling out mortar from some beds round the N., N.E., E., and perhaps N.W. and S.E. sides. The old mortar, once perforated by drills, might be attacked with a dilute acid. The whole tower was, till 1480, open as a lantern, like that of York, and the vaulting is a mistake that should be removed. E. L. G.

CAPLE'S "COMBINATION SET-SQUARE."

Sir,—I have to thank you for the notice of my "Combination Set-square," given in the Building News of last week, and should regret that a pear-wood instead of vulcanite specimen was sent you, but for the opportunity it has given me to detail a few more of its advantages over the ordinary 45° and 60°, which may be more apparent by the use of the vulcanite of smaller dimensions herewith.

Your "main" objection, as set forth last week, does not really exist, as you will see on further reference ; for if, referring to the pear-wood specimen, you take as your base line the 5½in. sides, the 30°, 45°, and 60° angles will equal respectively in length the dimensions of the right angle—viz., 9in. by 7in., by which these angles will then be formed, and you have the advantage of an extra angle on each side of the centre, equal to 165° or 15° in each case, with your square in the same position. I admit, however, that if, as you must have done, one side of the right angle is used as a base line, the 30°, 45°, and 60° angles will only measure half that which they would on an ordinary square of the same altitude ; but you obtain even in that case the use of three angles simultaneously—viz., by the 7in. side as a base line the angles of 90°, 60°, and 45°, and the 9in. side as a base line of 90°, 45°, and 30°.

If we suppose my "combination" was deficient in the respect you point out, it would still be more useful than two smaller squares, because of the altitude being greater by half—a matter of no small importance, as you are aware, to architects, engineers, and draughtsmen.

May I draw your attention to the fact that my square in any one position will give three different angles, and, in all, six can be obtained —viz. : 165°, 90°, 60°, 45°, 30°, and 15°? All professional men to whom I have personally submitted and explained it are high in their praises of its usefulness.

As your last week's notes may seriously affect its distribution among the profession, I should be obliged by a publication of these facts.—I am, &c., W. H. D. Caple.

Cardiff, Dec. 13.

THE PERSPECTOGRAPH.

Sir,—In reviewing Mr. Spiers' work on "Architectural Drawing" in your last issue, mention is made of the perspectograph, and as the agent therein referred to, I would ask your permission to make a few remarks respecting this instrument.

The perspectograph is a delicate instrument ; but its complicatedness is not really so great as with superficial acquaintance one is led to suppose. That it *can* outline perspectives mechanically is beyond a doubt. I have a machine in constant use, and shall be glad to show it to anyone who likes to see how it works.

I was, unfortunately, unable on the two occasions mentioned in your article to show the instrument to advantage, for the obvious reason that at the Inventions Exhibition it had been bent and maltreated by the public, and also had suffered from moisture and dust; and with the one sent to your office a very essential part had become lost in transmission. The manufacture of these instruments having come to an end in the mean time, I did not proceed in the matter.—I am, &c.,

C. W. ENGLISH.

69, Chancery-lane, W.C., Dec. 14.

Intercommunication.

QUESTIONS.

[9501.]—**Waterproofing Tank.**—Would be very glad to know what is the best material to point inside of tank built of white enamelled bricks, so as to make it thoroughly watertight.—B. P. G.

[9502.]—**Sapwood.**—I should feel very much obliged if some among your able readers would inform me how I can distinguish the "sapwood" or "alburnum" from the "heartwood" or "duramen," which has been discoloured by water-stain in consequence of the timber logs having lain long afloat. The question is intended to apply to Baltic yellow fir, the timber of the Pinus Sylvestris, which in this country is, I think, invariably kept afloat until required for use. When the bark is cut, should I be right if I can trace the discoloured edge clearly along the side, clearly bounded by a particular ring, in coming to the conclusion that the discoloured part was sapwood and not mere water discoloration? Is a little of the inner sapwood nearest to the heartwood allowable if it occurs on the edge only, and does not cover one side? As each year a new ring of sapwood is formed, is not the ring of sapwood nearest to the heartwood each year turned into heartwood? And if so, is there not a definite number of sapwood rings to the trunk of every tree? The carpenter who was planing the wood applied a steel scraper (the end of a joiner's square) to the planed surface of the wood nearly perpendicularly, and scraped it with considerable force, saying that if the wood was sapwood that treatment would cause it to work up woolly; but if it were mere water-stain that treatment of it would not rough the surface. Is this a good test? In this particular case the stain was traceable all along the side of the timber (about 24ft. long), distinctly bounded by the next ring, and continuing unbroken in a line from end to end. I was told that it would "dry out," as probably it would more or less, but it would, nevertheless, I apprehend, continue to be sapwood.—R.

[9503.]—**Stock Size.**—Will some reader who knows what the "stock sizes" of timbers are, give us a full list of them, so that we could compile a table of the various stock sizes of timbers for floors and roofs of various spans and use said table in our specifications and drawings? Such a reader would have the thanks of all builders and nearly all architects, who would, I know, rather specify the stock sizes if they knew them.—N.

[9504.]—**Liability for Damage.**—Some time ago I obtained a contract to pull down and rebuild some business premises, and the conditions stated that I was to be responsible for any damage that might occur to the adjoining properties during the progress of the work. After the new building is up, though not quite finished, a shrinkage occurs in one of the adjoining gables (which is only 4½in. and a party gable), the owner of the adjoining house claims damages of the owner of the new building, who, in turn, wants to make the contractor liable for the damage. The contractor says he is not liable, but says the damage is caused by the extra weight of the new building, which is four stories high, the old building being only two stories. Consequently the old gable has all the weight of the extra new gable, which was made 9in. thick above second floor. Is the contractor liable for the damage? The work was carried out to the architect's instructions. Also, is owner of new building justified in refusing to pay balance of contract to contractor, although the latter has obtained the architect's certificate certifying to the completion of the contract?—W. SCOTT, 54, Hedley-place, Newcastle-on-Tyne.

REPLIES.

[9474.]—**Ordnance Maps.**—"Def." and "und." are applied to boundaries, and are contractions for "defaced" and undefined.—R.

[9377.]—**Dimensions of English Cathedrals.**—I believe that St. Alban's Abbey or Cathedral has the longest nave in the world. It is 292ft. long. The entire external length of St. Alban's is 550ft.; Winchester boasts that it is 6ft. longer; Ely, with its western Galilee is 517ft.; Canterbury, 514ft.; Exeter, 387ft.—HARRY HEMS.

[9480.]—**Masonry and Stonecutting.**—The question at issue is not the one proposed by Mr. Harvey, but "arch-stone" versus "voussoirs." Mr. Harvey has pointed out no instance against the application of the former. In a cupola the stones are doubly archstones, and the theory of construction is based on the principle of the arch; still, it does not follow that for a special form—viz., the section of an arch rotated around a vertical line passing through its centre—a special term shall not be applied indicative of such form. Hence, the question is irrelevant to the issue.—JOHN POWELL.

[9482.]—**Products of Gas Combustion.**—I beg to thank "Science" for his kind reply. As carbonic acid is the result both of the "atmospheric" gas flame and of the ordinary "illuminating" flame, will he kindly explain the reason of the peculiar smell which arises from the former and not from the latter?—R.

[9484.]—**Chesterfield Spire.**—Mr. Peachey's practical experience relative to the above is very interesting. The spire 230ft. high, is covered with lead, and is constructed of oak. The latter material was probably more or less green when framed together, and in summer-time the heat of the sun upon the covering would naturally be very trying. I was apprenticed some twelve miles from Chesterfield's spire, and in those days always heard that his Satanic majesty was responsible for the distortion in question. Once, so the story goes, the Devil was out at night for a fly over the face of this wicked world, and chanced to rest awhile upon the summit of Chesterfield spire. It so happened that midnight mass was being celebrated at the self-same time in the church below, and the incense coming up through the belfry louvres, encircled itself in graceful clouds around the steeple. At last it reached the top, tickled the Devil's nose, and made him sneeze. With claws tightly clasping the vane, and tail twisted round and round the uppermost part of the spire, mouth wide open, and his wings spread out, he drew in his sulphurous breath and then sneezed and sneezed again. Those who prayed below heard the noise, and the townspeople who had gone to bed were woke up at what they thought to be successive peals of thunder. The next morning found the spire twisted in the fashion it stands to-day. 'Twas all the result of that dreadful sneeze. There is another old story that tells how a local smith was engaged to shoe the Devil by some magician who resided in a village near to Chesterfield. The smith, naturally nervous at his job, was clumsy, too, and ran a nail into Satan's foot, who flew howling away. Passing over Chesterfield he kicked out in agony, and so violently that he, catching the spire, twisted it and left the mark of his foot upon one of the buttresses. There is yet a third story, that in the good old days chaste maidens were not plentiful, and when at last a virtuous wench presented herself to be married at the church gate the steeple made her a profound bow, and actually twisted itself crooked by sheer gallantry. But this is told in common at other places—for instance, Ermington Church in South Devon has a tall stone spire, bent a long way out of the perpendicular, and that state of things the villagers so recently as yesterday affirmed to me came originally about on the memorial morn when a virtuous maiden became a bride. This is rather hard on the ladies, but so the story goes.—HARRY HEMS.

[9493.]—**Geology and Chemistry of Building Materials.**—Perhaps "Q. A. G." will find the information he requires in some articles (eight in number) on "The Chemistry of Building Materials" in the BUILDING NEWS for 1878; and on "Architectural Geology" (seven articles) in the BUILDING NEWS for 1879.—E. W. T.

[9494.]—**Hot Water Pipes.**—4ft. sup. of heating surface in the boiler will supply 200ft. of 4in. pipe, 250ft. of 3in. pipe, or 400ft. of 2in. pipe. If many bends are used, or the pipes are complicated to suit the requirements of the building, the friction will reduce the above 50 per cent. One foot of 4in. pipe (internal diameter) heats 222 cubic feet of air 1° per minute, when the difference between the temperature of the pipe and the air is 125°. This is, of course, subject to loss of heat by area of glass, ventilation, radiation, and other causes, which "Pack" will have to take into account.—JAMES THORNELOE.

STATUES, MEMORIALS, &c.

CHRIST CHURCH CATHEDRAL, DUBLIN.—A brass is about to be erected in this cathedral to the memory of the late Archbishop Trench. It is of latten, and is in two pieces. A standing figure of the Archbishop occupies a space 3ft. 9in. high, in correct costume, wearing the Order of St. Patrick, and holding in his right hand a Bible, the cover of which is a curious Celtic example, lent by Mr. T. W. Drew, architect, of Dublin, under a canopy, the details of which are designed in the style of the cathedral. On either side are figures of SS. Patrick and Lawrence, the one with an Irish episcopal baculum, and the other with an archbishop's crozier, both authentic. Lower down are two angels holding shields, with the arms of Dublin and Glendalough, and the arms of Kildare. The base contains the Trench arms, Capitular seals of Westminster, St. Patrick, Christ Church Cathedral, St. Bridget, and arms of Trench and Diocese of Dublin impaled. Messrs. Heaton, Butler and Bayne are the makers of the brass.

SOUTH WEALD, BRENTWOOD.—A monument of Sicilian marble, having a Latin cross 6ft. 6in. long resting horizontally on five octagonal moulded and diapered shafts, beneath which is a moulded slab richly carved with orchids, a favourite flower of the late Mr. O. E. Coope, M.P., to whose memory it has been erected, in the parish church of South Weald, near Brentwood, together with an elaborate alabaster reredos in St. Mary's, Whitechapel (noticed in a previous number), from the designs of Mr. E. C. Ayton-Lee, architect, and executed by Messrs. Earp, Son, and Hobbs, of London and Manchester.

At the last meeting of the River Tyne Commissioners, the Piers Committee announced that the engineer (Mr. P. Messent) had laid before them a report recommending the position which should be fixed for the pier heads. They recommended that there should be a width of 1,300ft. left between the pier heads, and the distance still to be built to carry the piers to the recommended terminations is 159ft. at the north pier and 137ft. at the south pier. Satisfaction was expressed that this great work is so nearly completed.

From among 44 candidates for the post of surveyor, the local board of Pudsey, near Leeds, have elected Mr. Richard Hodgson, of Grantham, and late of Idle, Bradford, to fill the vacancy.

LEGAL INTELLIGENCE.

THE LONDON AND SOUTH-WESTERN RAILWAY COMPANY.—An important arbitration took place on Thursday, the 8th inst., before Mr. Henry Clutton, at the Surveyors' Institute, in reference to the above. The Company have been widening their line of railway on the western side between Paradise-street and the Westminster Bridge-road, and it became necessary in crossing the latter road to erect a new iron bridge alongside the present one. The claimants, Messrs. Holloway Brothers, manufacturers of ready-made clothing, occupy Lambeth House, 157 and 159, Westminster Bridge-road. They claimed for injury resulting to them by the erection of the bridge and the diversion of the right of way, also for interference with light and loss of profit by reason of diminished sales. Their total claim amounted to £9,977. Various witnesses were called, and the arbitrator reserved his decision.

IS A TOBOGGANING SLIDE A "BUILDING"?—ELKINGTON V. SMEE.—(High Court of Justice, Dec. 13. Before Mr. Justice Wills and Mr. Justice Grantham.)—This was a case stated by Mr. Biron, the magistrate sitting at Lambeth Police-court, and raised the question whether a "tobogganing slide," erected in the grounds of the Crystal Palace, was a building within the effect of the Metropolitan Building Act, 1855, so as to make it necessary for notice of the erection of the structure to be given to the district surveyor under section 38 of that act. The respondent was the builder of the slide, and the contention on his side was that the slide was not a "building" within the meaning of the Metropolitan Building Act, or if it was it was exempted from the operation of that act by section 21 of the Crystal Palace Company's Act, 1881, which provides that "the main building, conservatories, and waterworks of the company, and the conveniences, and other works immediately connected therewith, shall be exempted from the operation of part 1 of the Metropolitan Building Act, 1855." But the section adds, that "this exemption shall not extend to any dwelling-house or building except as aforesaid upon any part of the property of the company." The toboggan slide was erected by a company called the Tobogganing Company under an agreement with the Crystal Palace Company. The slide and the structure connected with it were detached from the main building of the palace, and comprised besides the slide, 426ft. in length, a pavilion at one end, 63ft. long, part of which was occupied by an engine-room with brick walls and concrete foundations and roof, containing the engine used to work up the empty sleighs. The magistrate held that the structures were "buildings" within the meaning of the Metropolis Management Act, but were also within the exemption of section 21 of the Crystal Palace Act. He accordingly dismissed the summons against the respondent for not giving the notice abovementioned. The Court allowed the appeal, holding that the structure was within the Metropolis Building Act, and not within section 21 of the Crystal Palace Act. The case was accordingly remitted to the magistrate.

STAINED GLASS.

ST. MARGARET'S, WESTMINSTER.—A stained glass window in memory of Milton will shortly be placed in this church. It is the gift of Mr. G. W. Childs, of Philadelphia, who presented the drinking-fountain to Stratford-on-Avon, designed by Mr. J. A. Cossins and recently illustrated by us, and the window in honour of Herbert and Cowper to Westminster Abbey. At the request of the rector of St. Margaret's, an inscription has been written for the Milton window by the American poet, Mr. J. Greenleaf Whittier, who has sent the following lines:—

"The New World honours him whose lofty plea
For England's freedom made her own more sure,
Whose song, immortal as its theme, shall be
Their common freehold while both worlds endure."

An extensive tramway line to the Drawbridge at Bristol having been completed, was formally inspected by Major Hutchinson, on behalf of the Board of Trade, on Friday. The works have been carried out from plans by and under the supervision of Mr. Kincaid, C.E., engineer to the company.

A new building in Lodge-lane, Liverpool, for the Upper School of Liverpool College, is in course of erection. It has been built from designs by Mr. E. Harmood Banner, of that city, and accommodates 250 pupils, and is Perpendicular in style. Messrs. Brown and Backhouse are the contractors.

The Local Board of Tettenhall, near Wolverhampton, have instructed Messrs. H. J. and E. B. Marten to submit a scheme for the disposal of sewage. The anticipated outlay is £11,000.

Our Office Table.

THE City Court of Common Council proceeded yesterday (Thursday) afternoon to elect a City Architect and Surveyor in succession to the late Sir Horace Jones. The following eleven candidates had presented themselves for the appointment:—Herbert Duncan Appleton (aged 34 years), 157, Wool Exchange, Coleman-street, E.C.; Charles Barry (63), 1, Westminster Chambers, S.W.; Francis Chambers (58), 11A, College-hill, E.C.; William Henry Crossland (52), 46, Upper Bedford-place, W.C.; Goymour Cuthbert (38), 83, Queen-street, Cheapside, E.C.; Thomas Milbourn (52), 38, Bishopsgate-street Without, E.C.; Charles Nevin McIntyre North (50), 15, Borough High-street, S.E.; Alexander Marshall Peebles (47), 3, Salter's Hall-court, E.C.; John Hatchard Smith (34), 41, Finsbury-pavement, E.C.; Benjamin Tabberer (56), 13, Basinghall-street, E.C.; and Joseph Tanner (53), 109, London Wall, E.C. Two of these withdrew their applications—Messrs. Chambers and Hatchard Smith. The vote was then taken on the remaining nine names, by ballot. The first voting showed:—Peebles, 85; Barry, 45; Crossland, 31; Cuthbert, 6; Milbourn, 4; Tabberer, 4; North, 3; Appleton, 2; and Tanner, 0. A second ballot was then taken among the three highest candidates, when the voting was: Peebles, 108; Barry, 41; Crossland, 21, and the first having a clear majority of votes was declared by the Lord Mayor to be duly elected, and agreed to the prescribed conditions. Mr. Alex. M. Peebles, F.R.I.B.A., has long been in practice in the City, had held for many years a district surveyorship, and was, on the whole, the most suitable candidate. We heartily congratulate him on his appointment, which was generally anticipated by the profession.

FOLLOWING on the discussion and letter read at the last Friday's meeting of the Metropolitan Board of Works, the Works and General Purposes Committee have made a recommendation to the Board, for consideration at their meeting to-day (Friday). The notice in the *Agenda* runs in the following terms:—The committee report "for the information of the Board certain circumstances which have now for the first time come to the knowledge of the committee with respect to Mr. Hebb, the assistant architect, and recommend that Mr. Hebb be called upon to resign."

A NEW hot-water pipe joint has recently been invented and made at the Tyldesley Ironworks, owned by Mr. John Grundy, of 30, Duncan-terrace, City-road, London. It is claimed for this joint that it is impossible to blow off or become loose during expansion or contraction. This novelty will be interesting to those who understand hot-water fitting. Provisional protection has been granted to the patentee.

AN American inventor, William Dryden, of Hopkinson-avenue, Brooklyn, has just patented a form of building slab for lining the interior of rooms, which is claimed to be an advance on the usual lath-and-plaster construction. It consists of a composition of whiting, plaster, glue, straw, pulp, and alum, cast in slabs having vertical depressions on one side and corresponding spherical projections on the other side. The slabs are intended to be nailed up to the walls and underside of floor joints, as wall and ceiling surfaces, and the spherical projections are to be placed inwards next the joists, to insure a through current of air, while nails for fixing are to be driven through the corresponding depressions on the face of the slab. An opening is formed centrally in the ceiling of the room, a circular block being arranged beneath it, so as to leave an annular passage for the air and gases from the room into the ceiling space, and openings are also formed in the slabs at the skirting level for the entrance of cold air, all these openings being covered with wire gauze. By this means, it is held, a continuous air space would be provided round and above each room, while the composition of the slab would be a protection against the spread of fire.

TWO portraits of unknown persons have just been purchased for the National Gallery from the Lucas Walker bequest, and are numbered 1,230 and 1,232. The one is that of a girl by Ghirlandajo (1483—1561), and is hanging in Room No. I. Another work by this master, "The Procession to Calvary," purchased in 1883, is numbered 1,143. The other new work, that of a fair-haired man, dressed in black velvet, is the first example of Henry Aldegrever (b. 1502)—an imitator of Dürer's style and mannerisms—and is hung in Room No. XII. Some good pictures by this little-known German artist are to be seen in the galleries of Munich and Berlin.

A PRELIMINARY circular has been issued for the next convention of American master-builders, which is to be held in Cincinnati on the first Tuesday of February next. The circular is purposely issued at a very early day in order that the important subjects which are to be acted upon at the meeting may be maturely considered in the local societies before the delegates from these societies meet for final decision. The most important matter to be discussed is that of forms of contract, which the Association wishes to have made uniform all over the United States. To this end a committee was appointed last year to confer with committees from the American Institute of Architects and the Western Association of Architects, and "results of great interest to builders" are said by the circular to have been arrived at. Whether the "results" will prove as satisfactory to architects and owners as to builders, although a question of very considerable importance, is as yet undecided; but it appears that the Association proposes that all members shall decline to sign an agreement in any other form than the one to be put forward, and if this is insisted upon, the suggested model contract, no matter how carefully it may have been prepared, is certain to be looked upon with suspicion and disapproval by architects and their clients.

IN the course of an address to the students of the Islington School of Art, Barnsbury-street, on Friday night, Mr. Phil R. Morris, A.R.A., pointed out that although British art was really only about a century old, Hogarth being one of the first original English artists, during that single century our country had become filled with artists. The lack of beauty in our street architecture was due to a want of training in former generations—a want which was now being supplied. To the same cause was attributable, until very lately, the ugliness of our furniture. Even in the matter of a lady's dress, there was many a duchess of the last generation who would look with envy upon the simple toilet of a lady now. Art itself was simply the interpretation of nature adapted to the use for which the work was required. He believed art would never again be a matter of tradition. The whole civilised world was now brought into such close intercommunication that no longer would a nation's peculiarities be so strongly marked in its art as formerly; but we should be much more reflective and sensible in our art than we should be if we held an isolated position.

CHIPS.

Among the receiving orders in bankruptcy announced in Tuesday's *Gazette* appears the name of Joseph Brown, Belvedere-crescent, Lambeth, and King's-road, Wimbledon, timber merchant.

Dr. Schliemann has returned to Athens from Cythera, where he attained his main object of discovering the ancient temple of Aphrodite mentioned by Homer and Herodotus; but except some Cyclopean walls there are no vestiges of antiquity.

All Saints' Mission Church, Warrington, was opened on Tuesday. It is in a simple phase of Gothic, and seats 200 persons. Mr. J. Pierpoint, of Warrington, was the architect, and Mr. Gibson, of the same town, the builder.

At a meeting of the county justices of Kent, held on Friday, the revised and reduced plans of Mr. E. W. Stephens, of Maidstone, for the new asylum at Abbeygate Farm, East Farleigh, were finally adopted.

The York Corporation have accepted the tender of Mr. Joseph Clark, builder, &c., of York, for the restoration of the walls between Bootham Bar and Monk Bar. Four other tenders were sent in. The works will be carried out in accordance with plans prepared by the city surveyor, Mr. E. G. Mawbey, who has acted upon the valuable suggestions of Mr. G. T. Clark, of Tullygarn, Llantrissant, which have been considered and approved by the corporation.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyor's Institution. Discussion on 'Allotment Legislation." 8 p.m.
Royal Institute of British Architects. "Recent Development of the City of Vienna," by F. R. Farrow. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "Electrical Tramways; paper by the late H. Goodall on, "Open Hearth Steel for Boiler Making." 8 p.m.
Glasgow Architectural Association Lecture by David Barclay.

WEDNESDAY.—Civil and Mechanical Engineers' Society. "The Roof of the National Agricultural Hall, Kensington," by A. T. Walmisley. 7 p.m.

THURSDAY.—Edinburgh Architectural Association. "Architecture and Decoration in their Social and Economic Aspects," by P. Geddes. 8 p.m.

ARCHITECTS', ENGINEERS', AND SURVEYORS' REGISTRATION BILL.

The ARCHITECTS' and ENGINEERS' REGISTRATION ACT COMMITTEE invite all who are interested in the Passing of the above Bill to CONTRIBUTE towards the NECESSARY EXPENSES incidental to the presentation of the Bill to Parliament.

If this appeal is met with a ready response by the profession, the Bill will be presented to Parliament early next session by COLONEL DUNCAN, R.A., C.B., M.P., who has kindly undertaken to pilot the Bill through the House, backed by other influential members.

Subscriptions of all amounts will be acceptable, and all sums of £1 or upwards will be publicly acknowledged, and subscribers will be supplied with a Copy of the Bill.

Subscriptions may be sent to the Honorary Secretary, EDGAR FARMAN, Hon. Sec.

J. WATSON MOYSES, B.L., ROBERT WALKER, M.S.A., A.M.I.C.E., HUGH ROUMIEU GOUGH, M.S.A., F.R.I.B.A., } Treasurers.

39, King-street, Cheapside, London, E.C.

Trade News.

WAGES MOVEMENTS.

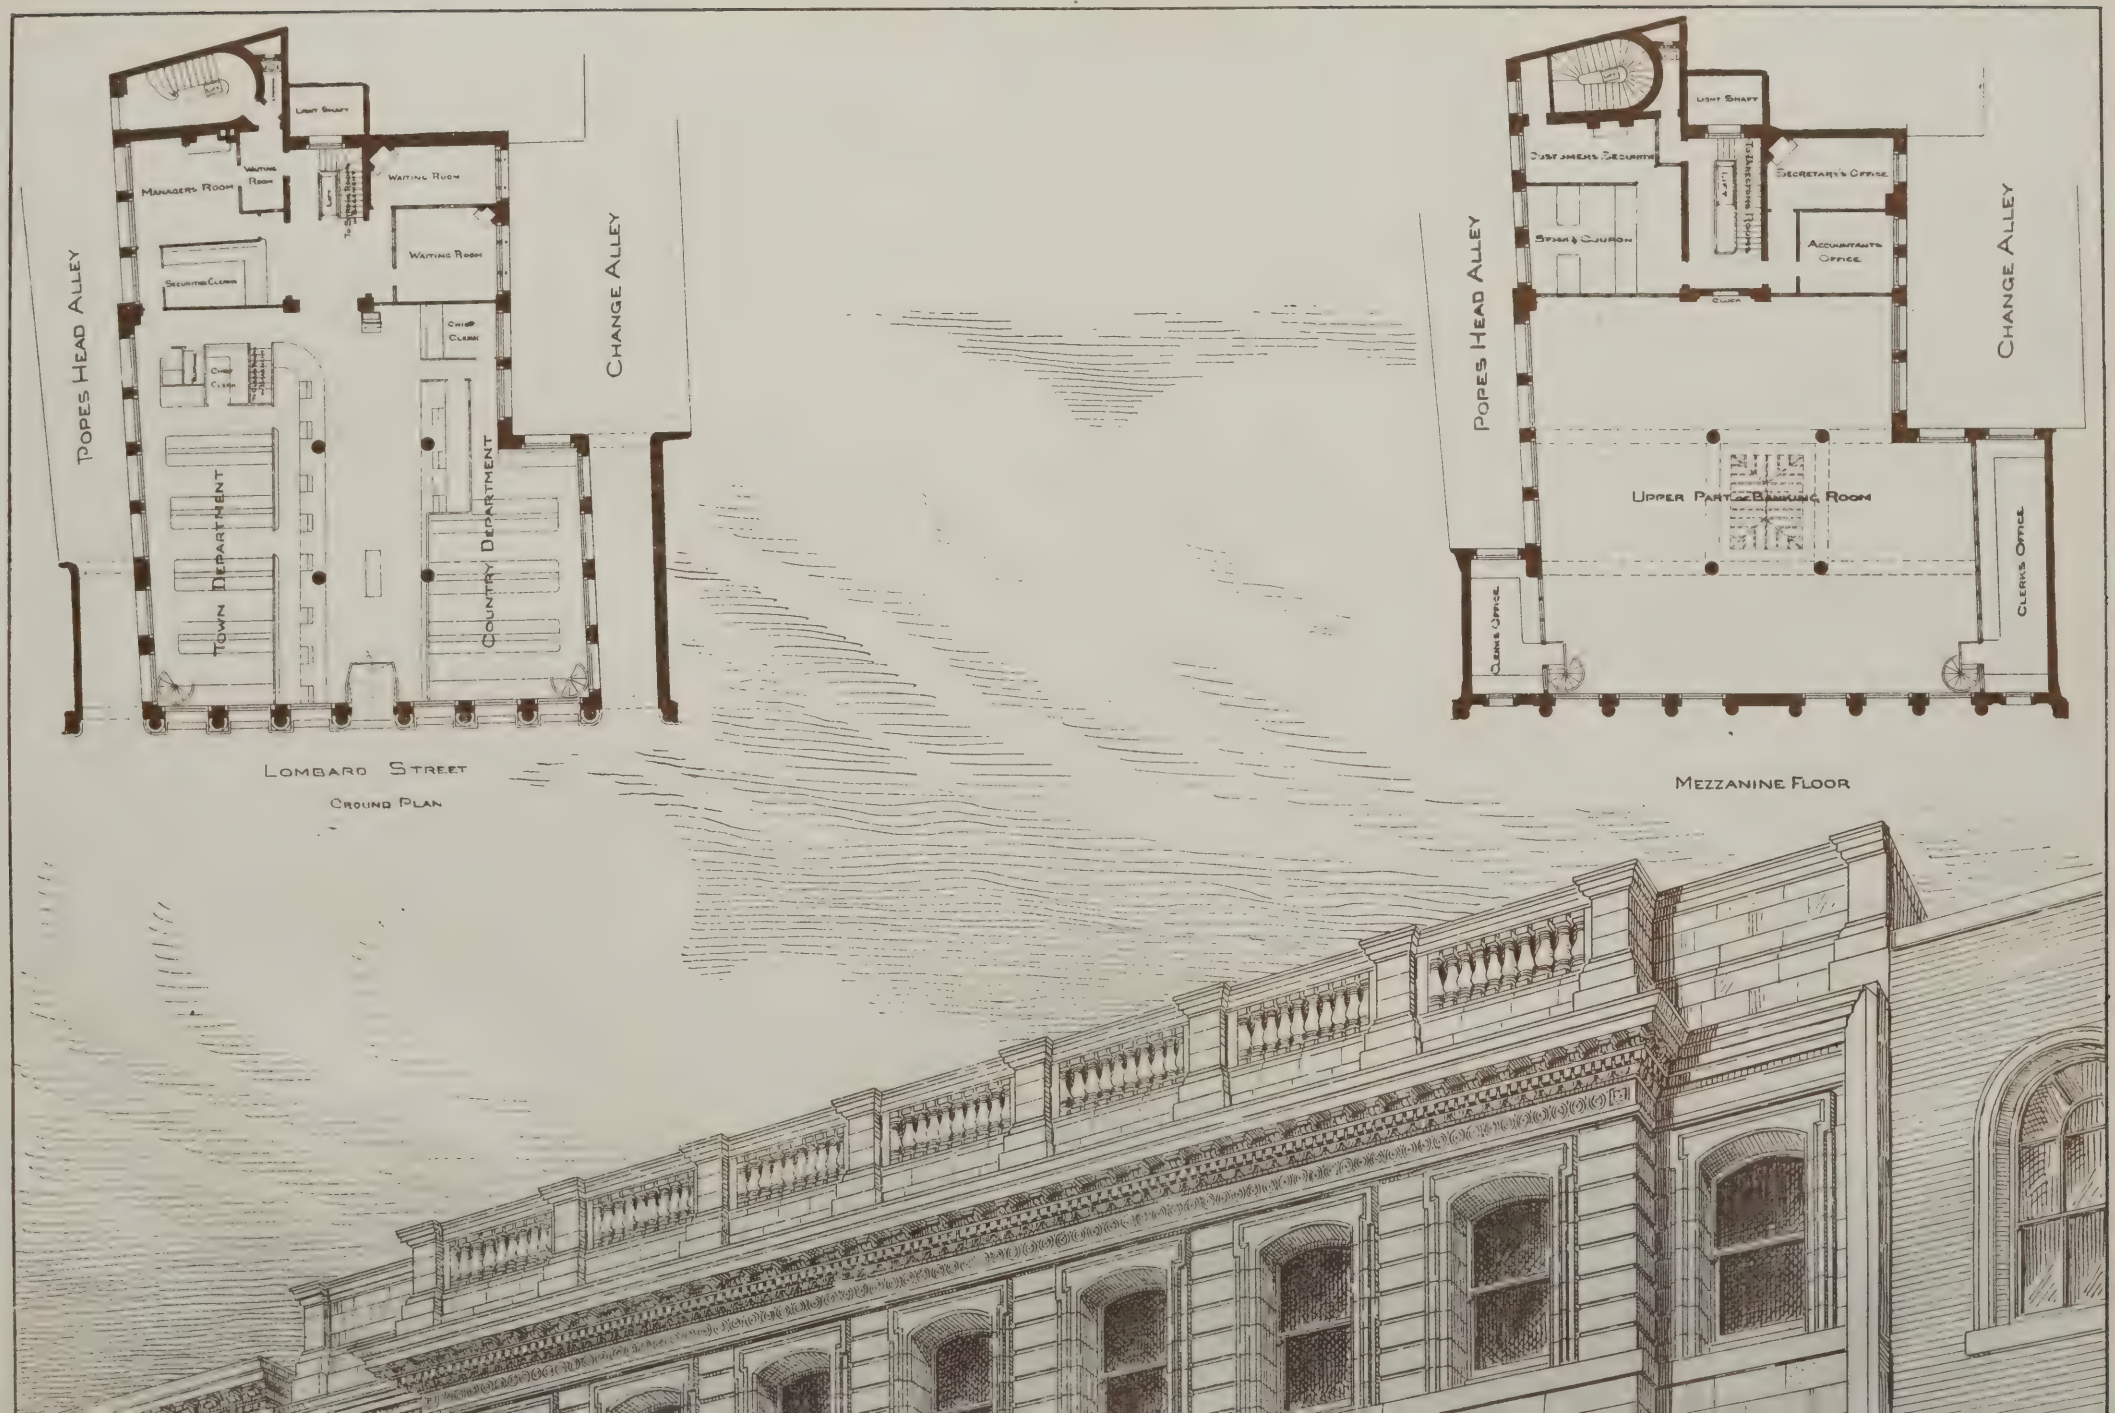
HULL.—An extraordinary strike and lock-out of plumbers has taken place at Hull. The local branch of the Operative Plumbers' Association objected to the employment by Mr. George Frederick Wells, of Prospect-street, of a non-society man, and he was asked to dismiss this individual. Mr. Wells refused to do so, and the whole of the master plumbers of Hull met and agreed to discharge every society man in their employ unless the objection was removed. This the society refused to do, and the men were then discharged, and non-society men taken on in their place.

CHIPS.

Extensive additions and improvements to the Queen's Hospital, Birmingham, are to be made at a cost of from £5,000 to £6,000; and the committee have called in the assistance of Mr. Ewen Harper, architect, of 57, Colmore-row, Birmingham.

A new chapel is to be built for the Wesleyans at South Shore, Blackpool, and a number of architects were selected to submit designs for the same; the result being that the drawings prepared by Mr. J. H. Burton, of Ashton-under-Lyne, were adopted by the unanimous vote of the trustees.

The monument to the pastoral poet, John Cunningham, in St. John's Churchyard, Newcastle-on-Tyne, was unveiled on Monday by the Rt. Hon. Sir M. W. Ridley, M.P., after restoration, a work carried out by Messrs. Brown and Sons, of Newcastle.



At a meeting of the Cardiff Corporation on Wednesday week, it was resolved to invite competitive plans to be sent in for laying out the 100 acres of land presented by Lord Bute to the town as a people's park and recreation ground, with an ornamental lake in the centre. The estimated cost is £30,000, but each competitor must name his own estimate. The competition is to be open to all England.

Holloway's Ointment.—This cooling Ointment perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsey, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment.

Cement is Tested, Mechanically and Chemically, at the NORTH OF ENGLAND TESTING LABORATORY, 2, Old Post Office-place, Liverpool. Also LUBRICATING OILS, Mechanically and Chemically.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1720.
FRIDAY, DECEMBER 23, 1887.

THE REQUIREMENTS OF PUBLIC BUILDINGS.

TO maintain an efficiency for safety and convenience of public buildings is one of the first duties of a State. The Romans had magistrates who undertook the supervision and construction of all buildings of a public character, and the office of the Ædile was regarded as a high one and a primary step to a distinguished position in the State. In France, Germany, and other countries there are departments having the control of national buildings—a kind of bureau—whose function it is to prescribe for and supervise the erection of national and other public structures. In the United States the Government of Washington has its supervising architect, and the question of a National Building Act has been under discussion for a considerable time. Our own separate municipalities have their borough surveyors, and in the metropolis there are at least two governing bodies, each having its own architectural functionary or superintending architect. Our systems of control work more or less smoothly, according as the legal machinery which set them in operation is perfect or otherwise. The chief hindrance is that the Statute law has been framed piecemeal, the enactments have been made after admitted failures and to rectify abuses, and have not been laid down upon any comprehensive plan. Thus the frequency of fires in London during the 17th century led to the framing of the Building Acts of which several were put into force, and in the following century the troubles arising out of party-wall disputes led to legislation. Again, the necessity for widening streets arose, and an Act was passed which made regulations about them, so that in course of a century several statutes were passed, all of them framed to meet some urgent state of the metropolis, and many of them conflicting and overlapping in their requirements. More extensive powers were then required; these gave rise to later Acts, till at length the confusion of so many sections and amendments became so bewildering to builders and others that a new Act was called for incorporating leading principles and the general provisions of former statutes. Such a measure was that of the Building Act of London, 1855, though far from being a complete piece of legislation. In a very few years it was found necessary to alter and amend the Act to meet new circumstances—such, for example, that buildings erected for the manufacture of machinery distant more than three miles from London, and of one story only, should be exempt from certain rules as to party-wall division. Afterwards a new Act transferred the powers over dangerous structures from the Commissioners of Police to the Metropolitan Board of Works. The provisions of the Metropolis Management Act of 1862 were subsequently called for.

Such conflicting and piecemeal legislation has been opposed to anything like a systematic administration, and a host of buildings have been erected deficient in many things, about which the Acts have said nothing. As new laws are framed these structures are found to be defective, and the owners or lessees of them are made amenable to the authorities for various modifications and improvements. One instance of this will suffice. Most of the London theatres were built before the recent rules came into force under the Metropolis Management Act, 1878, and were therefore defective in many points which recent experience has proved to be necessary to the safety of the public. The provisions contained in that Act empowered the Metropolitan Board of Works to make several alterations to existing theatres and music-halls, and, acting under those provisions, the Board have carried many alterations into effect at considerable expense to the owners and lessees. "Such structural defects as can be remedied at a moderate expenditure" were the only qualifying words in the Act. Several structural faults were left untouched. Lately it has been sought to make legislation still more severe, and not only to insist upon structural alterations being made in accordance with the suggestions of the Board, but to see that these alterations are maintained in an efficient condition. In the public interest these alterations are desirable, though they entail upon many owners a very large expense in altering buildings which were erected years ago. Although a perfect system of building regulations is a slow growth, the promoters of buildings set apart for public resort have a right to object to what they regard as a sort of vexatious interference with their rights—an inquisitorial and arbitrary dealing with them. Additional exits, and better stair approaches, and fire-resisting materials are all very necessary; but they ought to have formed part of provisions in the Act when first passed. The danger of fire only led our old legislators to prescribe rules for what they thought to be fireproof materials; they did not appear to entertain any desire to increase the number of exits, so the latter precaution has been reserved for more recent Acts to deal with. So with other details. But this slow-growing legislation has been costly, and has greatly impeded enterprise. It may be too late now to regret past omissions, yet it was easy to have forestalled the requirements of all public buildings of this class, if a comprehensive code of regulations had been laid down.

There are, for example, a few well-marked requirements for public buildings which distinguish them from the private class. Their structural strength should be greater; their walls thicker; their floors, galleries, and staircases of greater strength; the means of ingress and egress adequate to the requirements present and future of the establishment. The site is of the first importance, and in this particular a public building ought to possess facilities over private erections. Yet it is one of those conditions which have been left to good fortune and accident. No building law has ever provided that a church or a public hall should have a site open on two or more sides. Even so important a building as a block of municipal offices or a court of law has no provision for extension, or that it should stand at the angle of a square or be surrounded by roads, though the necessities of the public would have certainly dictated a site at once open, and with facilities of entrances and exits on at least two or three sides. Common sense and appropriateness have alone suggested open sites for these buildings; but a comprehensive scheme of legislation should have defined the needful requirements. For example: in the United States architects have been discussing the paramount requirements of a national building, and one author of a paper read recently has sketched out what these should be. Referring to site, it is suggested that it should be at the angle of a square, with its main façades to the south and east for proper light; that an undivided space of not less than 30ft. should be preserved upon the two inner façades as a protection against fire from adjacent property, and for circulation of air and admission of light. In London our principal public edifices have been well provided for. The Bank of England, the Royal Exchange, and the Mansion House form a trio of well-placed buildings, each surrounded by streets and having a wide space in front of them. The Houses of Parliament and New Courts of Justice have sites worthy of the palatial edifice raised upon them. The British Museum, the National Gallery, and the Post Office have sites leaving little to be desired; and the great Metropolitan basilica of St. Paul's is at least well isolated from adjacent buildings. But legally there was nothing to prevent any of these buildings being hemmed in between shops and houses—imperilling their safety, or, at least, the treasures some of them contain. After site, the entrances demand attention; yet not a word exists about their number in any building law, and even, as we have seen in regard to theatres, they have never been considered till recently. We consider it to be of the first public importance that every edifice set apart for assemblies should be provided with at least a certain number of entrances according to its size or capacity. The provision would, of course, divide public buildings into different classes or risks, the highest risk being that of a theatre or public hall, and the exits ought to be proportioned in number to them. What these ought to be would be a question of experience based on experiment. The rule as to theatres abroad is that two exits should be provided for 300 persons and three for 500. Capt. Shaw makes the sensible suggestion that the exits should at least be as numerous as the internal divisions of the auditorium, according to prices. Another authority says no allowance should be less than 3ft. for every 200 persons in determining the width of doors and stairs—a very small allowance. But it is not width of openings so much as the *number* of them that is desirable. It is far safer to provide a 3ft. or 4ft. door for every 150 persons than one doorway of double that width for 300 persons. At any rate, there might be a rule determining the least number of entrances allowable for a given number of persons and their least width. If this had been done by the framers of the Act of 1855, there would have been less call for remediable measures being taken now, and the owners of theatres would have been saved considerable expense and inconvenience. The Metropolitan Management Act exempts most of the public buildings we have named from the operation of the Act, though it is difficult to see why, unless it is thought that national buildings are generally planned and designed irrespective of minima of cost, and other considerations which usually weigh much with those who promote private enterprises. The Board has "power from time to time to make, alter, vary, and amend such regulations as they may think expedient with respect to the requirements for the protection from fire of houses or other places of public resort within the metropolis, &c." These words are far-reaching and general, and much is left to the discretion of the Board or its officers, and there is, from some recent incidents, little assurance that they will not be stretched in one case and relaxed in another. To prescribe the requirements as to the position and structure of houses or rooms of public resort, is not so easily done as when there are rules for guidance—of course, discretionary powers are important, and ought to be exercised in every particular case—but the requirements of entrance and exit, strength of floors and staircases, are things that are as equally necessary in one situation as in another. The difficulty of prescribing fairly in every case under the existing rules has no doubt been felt by the Metropolitan Board, who are now seeking to strengthen their hands. They could prescribe or give suggestions for structural alterations, but have not the power to see that the alterations were practically in operation. For example, they ask for fresh powers by their new Bill, to which we referred last week, to inspect theatres at any time, to see that the staircases are not obstructed by pay-boxes, or the gangways

blocked by chairs, and to see if all the exits can be easily opened outwards. Then as respects structural matters, there ought to be some definite rules given for the scantlings of floor timbers and girders for assembly rooms and galleries which are now left to the builders. How many gallery accidents there have been of late years! Supervision by district surveyors may be all that can be desired; but what is required are specific sizes for girders, bearers, and other things necessary to enable a floor or a gallery to bear its full complement of weight. A gallery often gets overcrowded, and the stamping of feet or a sudden rush may severely test the floor. Definite rules as to width, construction, and thickness of stone staircases, or, better, of concrete, should be enforced, though of all these matters there is really nothing to guide in the Building Act. Lighting is one of the requirements that are sadly overlooked in our public buildings. It forms no part of building law, except for purposes of sanitary efficiency. There is nothing to require every corridor to be well lighted by end windows, or that basements and offices should have at least good areas for ventilation and light. The materials and finish of walls and floors for the purpose of not only resisting fire but of preventing the passage of sound, are other details very inadequately dealt with; but we have said enough to prove that the essentials to a safe and a healthful public building have never been contemplated by the Legislature. The Building Act has been from the first chiefly remedial in its operation, of supplying defects after they have been discovered, rather than in prescribing and preventing calamities. Although in some respects more perfect, the by-laws for new buildings in urban and rural districts are also unsatisfactory. The power which every authority has to make by-laws with respect to new buildings in its locality has been somewhat misapplied by the framing of rules which seriously restrict the adoption of local materials and methods of construction.

THE LAW AS TO OWNERS OF DWELLINGS.

OWNERS and lessees of dwellings in a condition unfit for habitation or dangerous to health ought to take a lesson from the judgment recently delivered in the case of "Hyde *v.* Vestry of Marylebone," which came before Mr. Baron Pollock and Mr. Justice Hawkins. The case related to some houses near the Middlesex Hospital belonging to Captain Berners, and held by Mr. Hyde under a long lease, which expired at Michaelmas, 1886, and also having a lease of twenty-one years to commence from that date. The latter only paid a ground-rent of £5, and so was a "beneficial" owner under his lease. In July, 1886, the medical officer reported, under the Act of 1868 to provide better dwellings for artisans and labourers, against the houses, which was followed by the surveyor's report condemning the premises. A summons was issued to both owner and lessee. On the day after the first lease expired they both attended and objected to demolition. Soon after an order was made for demolition, but upon appeal to sessions it was altered into an order for structural alterations, going beyond Hyde's covenants to repair. However, Hyde gave notice to Captain Berners, and, with his consent, did the works required at an expense of about £400, and afterwards applied for and obtained from the Vestry a charging order, under the Act, charging that sum as an annuity on the premises. Captain Berners objected, and applied for writs to set aside the order, or of prohibition to restrain the Vestry from enforcing it. The Court delivered judgment against the applicant, Captain Berners, upholding the charging order charging the expense upon the premises. In his judgment, Mr. Baron Pollock remarked that the question was whether the order had been rightly made against Hyde—that is, whether he was at the time the "owner" within the meaning of the Act. He was of opinion that he was, and that the order was rightly made. At the time the notice was given that the premises were in an unfit state, he held the premises under a long lease unexpired, and also had a lease for twenty-one years to begin when the first had expired. He thought the Act intended the notice to be given to the then owner of houses in an unfit state, and the subsequent proceedings were to be upon that notice. The scheme of the Act showed the intention to enforce the liability of the party in whose hands the premises were allowed to become unfit for habitation. He thought that it was clear, therefore, that the person liable was the owner at the time the notice was given. The charging order was right, and the application was dismissed with costs. Mr. Justice Hawkins concurred in this opinion.

The decision is of importance as showing the interpretation of the Court on this part of the Act. Many an "owner" might evade the objects of this beneficial Act if it were otherwise. He could assign his interest, or, say his interest had expired, and the new owner would be rendered liable. The Act itself obviously intended to enforce the liability on the person who was owner at the time the defective condition of the premises was found. There was no presumption that on a change of ownership a new notice was to be given. The Act of 1868 has important provisions, which give power to the officer of health to examine any premises. If he finds they are in a state unfit for human habitation, he reports to the local authority, who refers the report to their surveyor, and he is authorised to inspect the premises, and report as to the cause of the evil, and the means of remedying the same by structural alterations or by demolition. On this report the local authority has power to call upon the owner to carry out the works necessary, the expense of which is to be charged on the premises as an annuity to be payable for a period of 30 years (Section 25). It was under these provisions that the lessee in the above case was ordered to execute the works necessary to put his houses in a fit state, and then to obtain a charging order on the premises. The provisions of this Act (Artisans' and Labourers' Dwellings Act) apply also to dwellings or buildings which, although not in themselves unfit for habitation, are so situated as to stop ventilation or make houses in their proximity unfit for habitation. For example, if a house is so situated that it obstructs air or light to another dwelling, the authority has power to order the pulling down of the "obstructive building." These provisions of the law have been found of essential value in towns where large blocks of houses built in courts and areas are found which obstruct any scheme for improvements. They enable a local authority to clear away all obstructive and injurious buildings, and to apply the other remedial measures of the Act. An owner, of course, has power to appeal and state his objections upon the reports of the medical officer and surveyor being sent to him, before any order for demolition is made, and there are clauses by which he can retain the site by undertaking to pull down, &c., which entitle him to receive compensation for the demolition. The above case establishes the meaning of the term "owner" in a way that might have been misinterpreted, and shows that the word in the Act is large enough to include interests in the term of an estate.

Mr. F. S. Granger, M.A., of Nottingham, has been appointed Lecturer in Classics and Philosophy to the Nottingham University College.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute for the present session was held on Monday evening. The PRESIDENT, Mr. E. I'Anson, announced that under the provisions of By-law 44, the following gentlemen had ceased to be Associates:—Henry Barber, of Manchester; W. J. Bowyer, of Cambridge; R. S. Ingram, of Kilmarnock; Ernest W. C. F. Schmidt, late of Eastbourne; Jas. Souttar, of Aberdeen; Edward Joseph Thomas, of London; and Charles Young, of London.

Mr. MACVICAR ANDERSON stated that three series of measured drawings had been received from competitors for the prize offered by Colonel Edis, who, it would be remembered, offered last year a prize of 20 guineas for the best set of measured drawings of any building or buildings erected in Great Britain and Ireland, in any style current between the years 1600 and 1800, to be made within a period of four weeks. The Council had selected the series of drawings from Exeter, submitted under the motto "Semper Fidelis." The sealed envelope containing the name of the successful candidate was then opened, and the drawings proved to be the work of Mr. Sidney K. Greenslade, of Ockendon-road, Islington, N. For the recently-created Travelling Studentship at Athens, of the value of £100, jointly contributed in equal proportions by the British school at Athens, and Mr. I'Anson, President of the Institute, seven candidates presented themselves—viz., James H. Cooke, Liverpool; Ambrose M. Poynter, Robert Weir Schultz, Ravenscraft Elsey Smith, James Cromer Watt, F. Ernest Williams, and Arthur Needham Wilson, all of London. The council having carefully considered the antecedents and character of the several candidates, and the quality of the work submitted, had awarded the studentship to Mr. R. E. Smith. Although the fact that this gentleman was the son of his father had, of course, not influenced the council in their decision; yet it was a source of gratification to feel that the award went to the son of so well-known and highly-respected an architect as Professor Roger Smith. On the screen were exhibited that evening drawings executed during his tour by Mr. A. Needham Wilson, the Soane Medallist for 1886; and also a selection from the drawings of the late Mr. Geo. Devey, lent by his executors.

The hon. secretary also read a letter from Sir James Fergusson, Under-Secretary for Foreign Affairs, stating that the third international exhibition will be held at Munich, from the 1st June till the 3rd October, as a celebration of the first art exhibition held in the Bavarian capital. As it is specially designed to obtain the co-operation of foreign artists with the view of enhancing its interest, Lord Salisbury has been requested to make it known to British artists.

THE RECENT DEVELOPMENT OF THE CITY OF VIENNA.

Mr. FREDERIC R. FARROW, the holder of the Godwin Bursary for 1886, read a paper on this topic. He commenced by describing th separation between the City of Vienna anditse surrounding town by a system of fortifications existing previous to 1857, and the proposals made to remove the separation, leading to the decree of the Emperor issued Christmas, 1857. This decree provided for the removal of the fortifications; the appropriation of the area partly for open spaces, partly for sites of public buildings; for the formation of a boulevard round the city, and a quay next the Danube Canal; for the sale of surplus land to form a fund from which were to be erected numerous public buildings, and for the promotion of a competition for designs of the proposed scheme. The competition was held, an official plan subsequently prepared in the Office of Works of the Ministry of the Interior, and the work commenced. The Stadt Park, the Palace Court, People's Garden, Rath-haus Garden, and the place in front of the Votive Church were laid out as open spaces. The building fund was established by the sale of surplus land at prices ranging from £150,000 to £300,000 sterling per acre, from which was defrayed the cost of erecting public buildings on the Ring. The Museum of Applied Art was erected for the purposes of a museum and technical art school during the years 1868-71, from the de-

signs of the late Freiherr von Ferstel, at a cost of £65,000. The Cur Salon in the Stadt Park is a building used as a concert-room and café, designed by J. Garben in florid Italian Renaissance. The Opera House was the first public building erected on the Ring, having been built during 1861-68 from the designs of Vander Nüll and Von Siccardsburg, at a cost of £500,000, for the accommodation of an audience of 3,000 persons. The Academy of Fine Arts faces the Schiller Platz, was designed by Baron von Hansen, and erected in 1874-76—contained galleries for casts and pictures, library and reading-room, and accommodation for students of architecture, sculpture, painting, and etching. The Art and Natural History Museum intended to form, with the Imperial Palace now in course of erection, one grand conception, from the designs of Semper and Hasenauer, were commenced in 1872 and completed in 1884. The Houses of Parliament, in Classical Greek style, designed by Baron von Hansen, consist in the main of a one-story building on a basement, and provide for a House of Peers and a House of representatives, with the necessary offices, &c. The Rath-haus was designed by Freiherr Friedrich von Schmidt, whose plans were selected in open competition. It was erected in 1872-84, in Modern German Gothic style, with an admixture of Renaissance features. It included a grand ball-room, 12,000ft. superficial area and 45ft. high, with its attendant supper-rooms, salons, &c., a council chamber and municipal offices. The University buildings contain 46 lecture-rooms for 6,000 students in the faculties of arts, laws, medicine, and theology; three large halls for festival occasions; examination-rooms, and a fine library, on the model of the Ste. Geneviève at Paris, for 32,000 volumes and 520 readers. The buildings were designed by Baron von Ferstel, were commenced in 1874, and completed in 1885. The Court Theatre, designed by Semper and Hasenauer in florid Renaissance, thus contrasting with the other buildings in the same interesting group—the Houses of Parliament in Greek, the Rath-haus in German Gothic, and the University in a severe Italian Renaissance style. On the site of the Ring Theatre, destroyed by fire December 8, 1881, the Imperial Institute had been erected, fron the designs of Baron von Schmidt. This building contains a commemorative chapel and suites of residences in "flats." These latter were especially noteworthy, as showing the latest phase of feeling in Vienna in respect to such domiciles, the rooms being for the most part entered directly from a vestibule or corridor, a distinct departure from earlier types of plan, in which the only means of access to many of the apartments was by transit of other rooms. The Bourse was designed by Baron von Hansen, and was erected in 1870-75 at a cost of about £350,000. The great hall, of basilican form, measures 195ft. by 130ft. in extreme dimensions; and there are also offices for bankers and stockbrokers, a corn exchange, &c. Among the chief hotels were the Grand Hotel, on the Kärntner-ring, with 300 visitors' rooms; Hotel Imperial, also on the Kärntner-ring, formerly the Palace of the Duke of Würtemburg, and the Hotel Austria, on the Schottenring, each with 150 rooms, and the Hotel Métropole, on the Franz Josef's Quay, with 400 visitors' rooms. The Palace of the Grand Duke William, on the Park Ring, overlooking the Stadt Park, designed by Baron von Hansen. In conclusion, the author exhibited plans of, and described some of the houses in flats, pointing out that house rents in Vienna were far higher than in London. Of these flats, the "Heinrichshof" is one of the largest in Vienna; it is situated on the Ring, and has been built from the designs of Baron von Hansen. The Globe House, erected in the Hof, in the Baroque style prevalent in old Vienna, from the designs of Ludwig Tischler, combining café and restaurant with the dwellings on the upper floors, is planned on the most modern system, with the rooms entered from vestibules or corridors. The house of Herr Neumann, in the Rudolfsplatz, with stone façade, was an exception to the stucco generally used in Vienna. The "Arkaden-Hauser," near the Rath-haus, had luxuriously-fitted blocks of residences, with cafés and restaurants on the ground floor. A group in the Stadiongasse, also near the Rathhaus, was planned on the older system of residences in "flats." The Schwarzenberg group, containing 100 dwellings in three blocks, was also planned on the older system. The private house of the brothers Böhm, in the Maria Lilferstrasse, had the ground floor arranged for shops and small residences for letting, and the third floor also arranged for letting. The Commercial Bank was a combination of business premises and residences on the upper floors. The author also briefly referred to some of the churches of Friedrich Schmidt, including the Brigittenau, the Weissgärber, the Lazzaristen and the octagonal planned and domed Gothic church in Fünfhaus.

ARCHITECTURAL DESIGN IN VIENNA.

Mr. THOMAS BLASHILL, Fellow, Superintending Architect to the Metropolitan Board of Works, also read a short paper descriptive of a recent visit, illustrating his remarks by a large collection of drawings and photographs he had obtained at Vienna, which showed most of the important new buildings. A plan prepared in the office of the architect to the municipality, showed the situation and surroundings of the city, which, as regarded latitude and altitude, only slightly differed from London. The climate, however, differed materially, and the general brilliant sunshine makes Vienna, to English eyes, first of all, bright. It could not be called a manufacturing or commercial city, but more the town residence of the emperor and wealthy classes. In some of the suburbs were important villas; but the middle classes lived mostly in flats, in which accommodation was far more expensive than a house and garden in London. The working population occupied houses of some architectural pretensions, with rather high rooms, in which, however, they were closely packed. From an elevated point, near the beautiful "Volks Garten," the chief of the new buildings could be seen: the Hof, or Court, theatre, now being completed by Baron von Hasenauer, sumptuous in design and decoration, and open on every side; Ferstel's University, and his Votive Church; the Palace of Justice; the Town Hall, by Baron von Schmidt; and the Houses of Parliament, by Baron von Hansen. On the Ringstrasse were the two Imperial Museums, and opposite to them the new Palace of the Emperor was slowly rising. Blocks of private houses filled up intervals and formed backgrounds to the view. The new Opera House, rather beyond the view, was a fine Renaissance building, possessing an auditorium very successful in respect te sight and sound. The grand Church of St. Stephen was a rare ancient example of the Gothic style; but the Votive Church and the Town Hall were almost the only instances of Gothic in that area, the group of spires in the latter forming a picturesque feature above the horizontal lines of the general mass of buildings. The sober character of the great mass of Italian designs was striking. Doorways, windows, &c., seemed old friends of thirty years' standing; and, though specimens of good Renaissance were not wanting, there was little or nothing of the very "free Classic" which, in the interval, had flourished in London. The Houses of Parliament was the only instance known to Mr. Blashill of the successful use of the Greek style in a large and complicated design. In this work it was developed into life and beauty. The building was of greyish-white marble, and the interior richly designed in coloured marbles, adorned with figure sculpture and harmonious decorations. Figure sculpture was a striking feature of the new architecture of Vienna. It was very cheaply executed, and was employed in every situation in which the human figure could be placed in the exterior of a building, and also much used in interiors. The back elevation of the University building furnished a good example of external sgraffito work. In Vienna, it seemed probable that it would long retain its freshness. Terracotta was used in enriched friezes and figure sculpture. Although much used, brick was seldom seen in the elevations of important buildings, much of the architecture being executed in cement upon a structure of brick. Stone was not the local building material; but good grey marble, reddish-white marble, and light grey limestones, were obtained for important buildings, besides the richly-coloured marbles lavishly used inside the Houses of Parliament. Portland cement had been much used; but old work executed in a local plaster wore well, and this plaster was still used. The new improvements were the results of a grand combination of tact, talent, and business capacity, and were worthy of study. He also referred to the employment of women as bricklayers' and masons' labourers.

Mr. WILLIAM WOODWARD said they had heard in that room on Friday evening that the study of the history of architecture should be abandoned to antiquarians, that examinations were unnecessary, and that building operations should be left to be conducted by builders; and he was not, therefore, surprised at the absence of the high art architects when such practical papers on the embellishment and laying-out of great capitals were read, especially as these arguments were endorsed in an eloquent commendatory speech by Professor Kerr. [Professor Kerr: I said nothing of the kind.] Such questions as the laying-out and widths of streets, the ideals of municipal control and administration, were beyond the "ken" of high-art architects; but they had had two valuable papers, following up those by the President on "Modern Rome," and by Mr. John Hebb on what had been done at Milan. It seemed that, with few exceptions, the architecture of Vienna might come under the category of the cast-iron type; but very great care seemed to have been taken by the Government to relegate the duties of supervision to those who were supposed to know what was most likely to contribute to the architectural adornment of the city. It would have been a great advantage to London if a similar Ringstrasse or boulevard to that seen at Vienna could have been carried out here. Our climate was not favourable to the employment of so much sculpture as the Viennese adopted on their buildings; but if more of the class used by the late Sir J. Pennethorne could be introduced into our buildings, it would greatly add to their effect. An example of the want of forethought and control exercised by the Metropolitan Board of Works was to be seen near Holborn Town-hall, where although the end of Gray's Inn-road, recently widened to 60ft., was shown by experience to be none too spacious, they were actually commencing a new street to the Angel at Islington only 50ft. in width.

Mr. HENRY DAWSON proposed a vote of thanks to Messrs. Farrow and Blashill for their interesting papers.

Mr. ARTHUR CATES, in seconding the motion, said Mr. Farrow's paper showed how great were the advantages to be obtained by young men who availed themselves of the opportunities for travel afforded through the liberality of Mr. George Godwin. It was no credit to the young men of the profession that this year there were no competitors for that Bursary. The papers, one by a student and the other by a mature official, highly placed, would probably benefit the Metropolis in the future. The works which were going on in Vienna and in other Continental capitals were in sharp contrast to what we saw in London, in their wisely prodigal expenditure on works for the improvement of the cities carried out with some degree of dignity. Although he could not say that the architecture of Vienna possessed the elegance of that of our leading architects, there was apparent great character, a harmony of composition, an openness and spaciousness, a liberality in design, and a generosity in execution. This spaciousness of design was very evident in the sizes of rooms and the widths of staircases of important buildings in Vienna. The keynote of this difference was that Austrian architects were subject to academical training, which, while it was productive of some faults, and hardened their style, it gave them a desire for height, and spaciousness. Our architects deserved some of the blame for the contrast to be seen in London, for they were possessed by a desire for economy of money and space, and did not insist upon aiming at grandeur of style, so that every scheme in this Metropolis was blasted by a miserable prodigality and a wasteful parsimony which was more expensive than a liberal scheme. The Metropolis might a century since have had a parallel to the Boulevards of Paris and the Ringstrasse of Vienna in the new road from Marylebone to the City; but it had been destroyed in effect by the miserable and squalid shops allowed to be built on the forecourts, and the same process was injuring all the wide thoroughfares in every quarter of London.

Professor Kerr said the fault lay on our mode of government. London could never, under Parliamentary and local self-government, achieve such great results as could cities under imperial rule. Still, in individual buildings in the City we could show exceedingly creditable examples of the work of the architect. At the same time architects should not cease to point out that outlay on the decoration of a city paid in a commercial sense; that it was a beneficial expenditure for the nation at large and a profitable investment.

After a few remarks from the President, who referred to the Thames Embankment as a work of ornamentation carried out by the much-abused Metropolitan Board of Works, the vote of thanks was carried by acclamation, and briefly acknowledged by Messrs. Farrow and Blashill.

ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the forty-first session of the Association was held on Friday evening, the President, Mr. John Slater, B.A., in the chair. The following new members were elected:—H. H. Dunn, G. P. D. Saul, S. A. Stanger, J. G. Henderson, D. F. Pitt, P. R. Smith, P. Hayton, jun., E. A. Masey, F. C. Eden, A. F. Faulkner, F. Bouch, H. W. Bannan, E. Osborne, H. J. Hicks, E. L. Lutyens, G. P. Wagstaff, and W. E. Wears.

The President announced that a special business meeting would be held on January 20, for the purpose of discussing the question of the affiliation of provincial societies, and the proposed alterations in Rule 22 relating to the constitution of the committee.

THE PROPOSAL TO MAKE ARCHITECTURE A CLOSE PROFESSION.

A paper was read by Mr. T. G. Jackson, M.A., F.S.A., on this subject, which appears *in extenso* onthe next page. At its close,

Mr. G. A. T. Middleton said, that as a member of the Committee which was promoting the Architects' and Engineers' Registration Bill, he wished to thank Mr. Jackson for his criticisms of the draft, as it was only by acting on the suggestions conveyed in such honest and outspoken criticisms that a committee could so modify the provisions of such a measure as to render it workable. He regretted that he could not agree with many of the arguments used by the lecturer. He was surprised to hear Mr. Jackson say there were no points on which architectural knowledge could be tested by examination. Anyone who had gone through the Institute examination, as the speaker had done, must be aware that it was a good one; it did not, and could not, include tests of artistic powers, but it would exclude men who did not understand constructional matters. This R.I.B.A. examination was the one specified as a test of fitness for the registration of English architects in the Bill to which he had referred, which proposed to give the control of examinations in Ireland to a similar body, the Institute of Architects in Ireland. Scotland at present possessed no corresponding professional body claiming to represent its architects. Mr. Jackson had asserted that the public were sufficiently protected by the present statutory regulations. This might be the case in the Metropolis, where the district surveyors were a highly qualified body of men; but it was not so in provincial towns, and especially in rural districts. The Bill would correct this, and would insure that in a few years none but competent and well-qualified men acted as architects and surveyors, which was more than could be said to be the case at the present time. Engineers and surveyors, as well as architects, were included in the one scheme of registration, for no Bill which failed to do so would have a chance of passing; but it was distinctly provided that the examinations should be separate. The Bill recognised, in fact, three distinct and well-defined branches of the profession. The lecturer had stated that the object of candidates entering for a test examination was not the acquirement of knowledge, but of a diploma; but, he would ask, did this apply also to medical and legal students, who equally had as the goal before them the passing of an examination entitling them to a diploma to practise, but who were generally admitted to obtain in the preparation for those examinations a considerable knowledge of their respective professions? The objections raised by Mr. Jackson applied fairly enough to competitive ones, such as those held for admission to the Civil Service, but not to those held under the auspices of the Institute. It was desirable that every person practising in the profession should have to pass some test of general fitness, and should also have served articles of some form of pupilage. Whether the terms of pupilage set forth in the Draft Bill were the best that could be devised was as yet uncertain, but if they failed to meet with the approval of the majority of the profession they would be modified. He agreed with the lecturer that no man's position would be raised or lowered by registration, and he thought no one proposing to enter the profession would be such a cad as to imagine that his social position could be affected by enrolment in a list. It was evident that all men at present in practice who chose to register must be included in the lists, but as time went on the incompetent men would gradually drop out, and the profession would reap the benefit of registration. He differed from the lecturer again in his suggestion that the general public were not interested in the matter. He knew that most medical officers of health felt strongly in the matter, and that their view were shared by many medical men and members of the professions.

Mr. Bernard J. Dicksee said, as one of those disqualified under the Registration Bill—namely, men who had commenced practice since 1882, and who had not been articled—he objected to its provisions. An open door of salvation had, however, he found, been left for him, as members of that Association were to be recognised; though what better qualifications he possessed the day after his election than he held the previous day he had yet to learn. One of the Scottish societies mentioned in the Bill, membership of which would qualify for registration, admitted to its ranks, he had been informed by a competent authority, house painters, glaziers, and decorators.

Mr. William Woodward thought that the practical question for consideration was whether the Architects' Registration Bill would or would not benefit the profession. Those promoting that Bill believed that the obloquy which had been cast upon them had arisen, not so much from architects of good standing, as from those who had unwarrantably assumed that name and were unworthy to be recognised as members of the profession. Others had feared that the Bill, if passed, would quash the R.I.B.A. with its compulsory examination for Associates. It would, he thought, have been better if a less distinguished architect than Mr. Jackson had taken the question up, for from Mr. Jackson's high position in the profession he could look with unconcern on the difficulties which the average young practitioner felt from the unfair competition to which he was exposed. He wondered Mr. Jackson had not strengthened his position on this question by telling them the names of members of the legal and medical professions who were outsiders, and yet more distinguished than those within the ranks; but he had not attempted to do so. Apart from this question of registration, he had been much surprised by some of Mr. Jackson's observations as to the qualifications of architects. He had informed them that the construction of vaults and walls was mere builders' work, and that the history of styles and art, which had been thought to be most essential items of knowledge to professional men, were only interesting to antiquarians. If Mr. Jackson was correct, and construction and style were outside his province, they had nothing left to the architect but the designing of the mere façade of his building. Was the contriving of this art surface, the simple casing of a building, that which Mr. Jackson would have them regard as alone entitling a man to assume the name of architect? The lecturer, moreover, had said that the true friend of the architect was not the engineer or the surveyor, but the painter and sculptor, but the latter gentlemen were not introduced to the architect except in the very largest buildings. The decorator might be allowed to be the friend of the architect, but the speaker could not see how the painter could be recognised as such. Mr. Jackson's assumption would confine the profession to buildings of the first class in magnitude and importance, and would relegate all other work, such as sanitary matters, engineering, even decoration, to various experts.

Mr. H. Roumieu Gough said he had been delighted to find from Mr. Jackson's paper how very weak the arguments were which could be adduced against Registration. When the speaker first took up the question he met with much ridicule, misrepresentation, and even insolence; but in the opening addresses of the present session, the president of every professional society, including the Institute and all the provincial bodies, had alluded to the proposal. To allege that the profession did not call for closing the entrance by examination was absurd; to allege that the public were not interested in the movement was more difficult to disprove; but whenever he had written to the public Press on the question, the number of letters and inquiries he received from outsiders showed the interest that was being aroused. The chief point of controversy seemed to turn on the inclusion of engineers in the Bill; but it was only within the past century that the profession had been separated, and it would be practically impossible to obtain statutory powers to prevent engineers from practising as architects, and *vice versâ*. He held that every professional man calling himself an architect ought to understand all about materials, to be able to calculate stresses and strains, and have some knowledge of engineering matters. He knew that those who regarded architecture as a fine art, pure and simple, would not agree with him; but if they looked at the etymology of the term "architect," they would recognise that at least its original meaning was the "chief builder." They had been told that an architect's knowledge could not be tested by examination, and that registration was, therefore, impracticable, and would not benefit the profession. But let them ask any medical or legal practitioner if they were willing to tear up their charters, or if their examinations were valueless as tests; the ideas would be scouted as monstrously absurd. If they granted, for the sake of argument, that knowledge in art could not be tested by examination, yet the knowledge of construction and materials could be so tested, and its possession would not render a man less artistic or accomplished. An artist as such was useless as an architect unless he were also qualified to construct. Mr. Jackson had also said in the early part of his paper that the Registration Bill was being promoted by men who would not regard the Institute as the great central body. That was a mistake, for the promoters of the Bill had expressly named the Institute as the examining body for Great Britain.

Professor Kerr thought the time had come when the meeting ought to be called on not to misinterpret Mr. Jackson's views. There were some to whom his phraseology might be obscure, but many would remember the time when such words were in everybody's mouths, and were used by distinguished men who had now passed away. When Mr. Jackson spoke of architecture being an art somewhat distinct from engineering and construction, why should he be ridiculed and misrepresented? Why was the suggestion made that the lecturer thought the construction of an edifice was the work of a builder, and that its beautification that of another man? Such criticism was utterly unworthy of an answer. What Mr. Jackson contended for was that England could afford and ought to maintain an architectural profession more or less suggestive of fine art, and that pure art could not be taught. The late William Burges nailed that thesis to the wall, although he could not express it logically, but he trusted that those who could argue the matter out would do so. At the present time the architectural profession was undergoing a marked change in this country. There was, for instance, a great change apparent within the Institute of British Architects. Not many years ago the number of its members was fewer, and although not more select than at present, its pre-eminent men were, in a certain sense, more distinguished in the eyes of public society. The Institute was then a learned society, but that state of things had passed away; that was to say, the public interests in this country, and the professional interest inside and outside the Institute, did not necessitate it to confine itself exclusively to art and learning. The Institute

ran a risk, therefore, of losing touch with art altogether. The Council of the Institute had recently adopted a measure quite in accordance with the spirit of the age—that of admission by examination, as far as it could be applied to architecture and for what it was worth. It was not an academical examination, but an ordinary practical test—not intended for the purpose of keeping out so much as of letting in names—although they practically, he must admit, amounted to the same thing. Then came Mr. Gough with his Registration Bill, which was a perfectly honest movement for the extension of the principle of exclusion or inclusion—whichever way people chose to regard it. For his own part, he did not believe there was a chance of the Bill being read a first time, still less of its passing; but he would give its promoters a fair opportunity. The position of the Architectural Association was different: its object was primarily education, and was a pure, practical, commonsense, adaptable one to suit the purpose of the times, day by day, and he hoped its members would adhere to the principle of mutual instruction. Mr. Jackson had, he thought, said in a scholarly way that they must not let architecture, as an art, die out. The question was whether the time had not arisen for the formation of the nucleus of a new body of artist-architects elected by artist-architects, not, however, in connection with the Royal Academy, for that was hopeless, but in the profession itself.

Mr. Arthur Cates had listened with great interest to Mr. Jackson's admirable paper, although its author had made therein an onslaught upon what was very dear to him—the Institute examination. Nothing could be more fatal to their prospects than would be an examination conducted on the principle of that of the Civil Survice, and which, instead of inducing students to study, led them to cram to satisfy examiners. The Institute examination, although not as yet a triumphant success, had been acknowledged to have been of great practical benefit to those who prepared for and passed it. This examination met with much opposition at first, but the views of architects had advanced of late years, and at the last conference all seemed to be in favour of the principle. The aim of its promoters was that the architectural pupil should from the first be encouraged to study for his profession, and that his progress and accuracy should be tested by questions. Mr. Jackson had taken a very high standard of an architect's power, which he was entitled to do by his own attainments, but which few others could reach. It was the misfortune of the architectural student that his preliminary education, even at public schools, was miserably imperfect and inadequate, and he and others therefore hoped that the Institute would establish, in addition to the present compulsory examination, preliminary and intermediate ones. It would be desirable in many ways that provincial societies should be affiliated to the Association, binding young architects in one league throughout the country, and leading up to the Institute examinations.

Mr. Cole A. Adams proposed a vote of thanks to Mr. Jackson, remarking that he should have preferred to have heard him lecture on another subject, for he ventured to think the one chosen was hardly the one to bring before a body of students banded together for mutual instruction, but savoured too much of high politics. He was surprised to hear Mr. Jackson, in this year of grace, attempt to throw cold water on an architectural examination, for although all agreed that it was impossible to test acquirements in art, still art represented but one side only of the profession. Any test of constructural knowledge was of great importance to the architect, and one which was paralleled by the examinations existing in all other learned professions. He did not believe that preparations for examinations would unfavourably affect a man's artistic capabilities. It would be an insult to suppose that the distinguished gentlemen Mr. Jackson had mentioned would have failed to pass the Institute examination. He hoped that after what had fallen from all speakers that evening, Mr. Jackson would modify his views. The cry for the abolition of examinations might be expected from some young students, but not from gentlemen of Mr. Jackson's standing in the profession.

Mr. Edgar Farman did not concur with the last speaker in deprecating the subject chosen by Mr. Jackson. The question of closing the profession vitally concerned students, and no better or more important topic could have been selected.

The President remarked that, in his opinion, Mr. Jackson had done students a very great service in bringing the question forward. He agreed with him thus far, that an examination should be regarded as a means, and not as the end, of preparation and study. The late Mr. Street was at one time strongly opposed to the voluntary examination; but before his death his views changed, and in later years he held that it was a very good thing for students. It was not requisite for gentlemen like Mr. Jackson; but many students received no professional instruction at all, and the only way in which the use a student made of his opportunities could be tested was by an examination. The fact that under the compulsory examination ten times as many candidates presented themselves as under the voluntary system showed that it had not been a failure, although he should like to see the numbers largely increased. We had, as Mr. Jackson remarked, district surveyors to look after the safety of our buildings in the Metropolis; but how could it be ascertained if they were qualified to discharge their duties if they were not tested by examination, and ought not this system to be extended all over the kingdom? As to Registration, he concurred with Professor Kerr that he did not see any likelihood of the Bill passing, but this was a question of high politics into which he would not go.

The vote of thanks having been passed by acclamation,

Mr. Jackson replied. He observed that registration and high architectural politics were not the subjects he should have liked to talk upon that evening, for that Association was not quite the right body in which to discuss those matters. At the same time, it was important for the younger men of the profession to consider whether they would make architecture a close profession, or whether they would retain their liberty; and it was desirable that they should be prepared for the question when it came practically before them. Many points in the paper had been criticised; but one had not been touched on, and that was that any scheme of registration would bind architecture into a close profession, and any Act could only have the effect of preventing builders and others from calling themselves "architects," and they would, in fact, do the same work as now, but only refrain from entitling themselves architects. The Registration Bill would have the effect of making three classes—artist-architects, registered architects, and mere builders. Each class would go their separate way; the mere builders would not suffer, but he believed the better men would. It had been misinterpreted by some, but he placed the utmost value on sound and good construction. The progress of architecture would depend on the increased knowledge of construction, and as time went on he believed new ideas would arise in the minds of architects, and thus a new style or styles would be evolved. It had been urged that, although metropolitan district surveyors were well qualified, provincial surveyors were not so well informed; but the reason for this was that the better class of men would not take such places because it would not be worth their while, and he did not see how any scheme of examination or registration would improve the remuneration of those officials. One fatal objection to the proposals was that there could be set no fixed standard of examination. His remark that the true friends of the architect were the painter and sculptor had been criticised, but he meant to show that the kind of study to which the architect should devote himself was the fine arts, and not the mere work of the engineer or surveyor. The architect's training ought to be artistic, and in sympathy with the allied arts.

A committee of the City Court of Common Council has recommended that the salary of Mr. Andrew Murray, principal assistant in the architects department be raised from £600 to £800 per annum; and that of Mr. T. Baker, officer for surveying the City Lands and Bridge House Estates, from £500 to £550.

THE PROPOSAL TO MAKE ARCHITECTURE A CLOSE PROFESSION BY IMPOSING THE TEST OF EXAMINATION AND REGISTRATION.*

IT is obvious that so sweeping a revolution as that by which what is now a free and liberal art, to the pleasures and honours of which all may aspire who can obtain employment, would be converted into a close profession like law, physic, and divinity, to which admission could only be obtained by apprenticeship, payment of fees, examination, and diploma, could not be effected without influencing for good or for evil the progress of architecture in the kingdom. It is, therefore, a matter which ought to be thoroughly considered in all its bearings, and from all points of view, both by those who follow architecture as a profession, and by all others outside our ranks who value the progress of art among us. Nothing could be more disastrous than that such a radical measure should be hurried through Parliament and become law without any real certainty that it is desired by the public, or even by the whole body of architects; without any clear prospect that it would help to improve the architecture of the day, or even that it would not, on the contrary, fatally injure it; without due consideration for the case of those on whom the new restrictions would press with undeserved hardship; and, above all, without proper intelligence of the undoubted blessings of liberty from State or bureaucratic control which we should sacrifice. This thorough and impartial consideration the proposition has never yet received. The advocates of the measure have had their say, and have probably said all that is to be said on their side of the question. Those who object to it have been generally silent; the success of the scheme seemed to them unlikely, and the attempt to carry it out not dangerous; and they have consequently turned away with a feeling of security from the discussion of a question which, while it remained a mere question, was uninteresting to them. The time has, however, arrived when their views ought to be known, and the arguments against the proposed change ought to be listened to with equal attention to that which those of their opponents have received. It is for this reason, therefore, that I have chosen as my subject to-night "The Proposal to Make Architecture a Close Profession by Imposing the Test of Examination and Registration." It seemed to me also that the discussion which I wish to provoke would, with special propriety, be begun by one, like myself, who is not a member of the Institute or any other architectural society, and who may therefore be regarded as in a special way able to look at the matter impartially. The history of the scheme and its growth from a mere speculative idea into the concrete form of a Bill, which it was sought to bring into Parliament last session, is given briefly in the *Journal of Proceedings* of the Royal Institute of British Architects for November last. From that account it appears that the Council of that Society for 1859-60 reported that "the establishment of a system of compulsory examination, extended to all architects, whether members or not of this Institute, was considered desirable." The first step taken towards this end was the establishment of voluntary examinations of candidates for admission to the Institute, which, after some twenty years, became compulsory. The further extension of this examination is now seriously contemplated, and Mr. Connon, the author of a paper in the Journal I have just cited, says that "should compulsory registration become an accomplished fact, the registering and examining authority should alike be vested in the Institute." Meanwhile, however, in the absence of any sort of coercion, it would appear from the same account that these examinations have not been attended by a great measure of success. From 1861-81, while the examinations were voluntary, the average number of candidates who passed annually was less than three; while, since 1882, when the examination for admission to the Society became compulsory, the number has risen only to twenty or thirty, although, according to one statement, no less than four hundred students, on an average,

* A Paper by Mr. T. Graham Jackson, M.A., read at the Architectural Association meeting, at 9, Conduit-street, on Friday, December 16, 1887.

enter the profession yearly. It is clear, therefore, that we are very far from the state of things contemplated by Mr. Connon under which the Institute would hold the keys of admission to the profession. As a step towards the attainment of that object, it is now proposed that all the local architectural societies in the kingdom should accept the Institute as a common head, to which they should be affiliated, so that the parent society should stand to architects in the same relation as the Incorporated Law Society to solicitors and attorneys. But in spite of the analogy, this dignified position will not, it seems, be willingly accorded to the Institute by all those who promote compulsory registration, and it is from the dissentients that the first tangible scheme for closing the architectural profession has seen the light in the form of a Parliamentary Bill. Whether if registration were carried the Institute would have the management of it or not is unnecessary to discuss here. I should myself agree with Mr. Connon that it would be the natural and most convenient plan; but this is only a matter of detail, and I wish to-night to confine myself to principles. Setting aside this point, the Bill, of which I dare say most of those in the room have seen an abstract, may be taken to give correctly in the main the nature and scope of the restrictions which it is desired to place on the pursuit of our craft. I propose to examine them in detail. The Bill calls itself "The Architects and Engineers Act," but it includes surveyors also within its jurisdiction, and its object is to combine architects, civil engineers, and surveyors — surely a strangely heterogeneous assembly—into a close profession of which the members are to be registered after a qualifying examination, and, of course, payment of certain fees. After a certain date it is proposed that any unregistered person calling himself an architect shall be fined £20 for the first and £50 for each subsequent offence; that no public body shall give him any appointment; that his certificate shall have no legal value, and that he is to have no *locus standi* in a court of law for recovery of his professional charges. The only way to registration is to be in the first place by apprenticeship to a registered architect for a term in general of five years, and afterwards by examination. The term of apprenticeship is reduced to two years in the case of assistants of five years' standing and students who have passed the examination of the Institute or others like it; while assistants of eight years' standing are excused the examination, though one reads with surprise that even they are expected to serve an apprenticeship of two years beyond that time. Such is the outline of the Bill, which may be summed up in three words: registration, to which the avenue is by apprenticeship and examination. Looking more closely at the details of the Bill one cannot but be struck by the unequal measure meted out to apprenticed pupils and assistants. The articled pupil may present himself for examination after five years' pupilage, but the salaried assistant, after serving five years, must undergo two more as a pupil before he can do so. Now it is likely that before he became an assistant he had been some years learning his business in an inferior capacity, so that probably he would have undergone a probation of nine or ten years before, in the opinion of the framers of the Bill, he was qualified to offer himself for examination. But during these five years the assistant is at least as likely as not to have made better use of his time than the pupil, and it is simply unjust that the man who can afford to pay a premium should be floated into the profession at the end of the time, while, from want of a golden key, his poorer companion has to go to school again for two years more. This is a hard case enough, but what must we say to that of the assistant who is to be subjected to two years' apprenticeship after eight years of service as a draughtsman, which probably implies twelve years or more of training for a profession to which the man with a premium in his hand may obtain admission after five years or less? If the final qualification is to be by examination, what need is there for the further qualification of apprenticeship? If an assistant or any one else can pass the examination, that ought to be enough. But this evidently is not the intention of the Bill, which proposes to adopt the restrictions of the old trade guilds and modern trade unions. Like them, it makes apprenticeship the only door of entrance, and as no architect in his senses would take pupils without a premium, their services being of little or no use even at the end of their term, the result would be that there would be fewer architects to share the same amount of work, and that poor men, however well qualified, would be left on the outside of the door, while a golden shower of premiums would fall on those who are on the right side of it. As the same fortunate persons are to have the sole right to hold public appointments, it is easy to see who would be the gainers and who the losers by the new state of things. Although the Bill professes to be drawn in the public interest, it is not our fault if it awakens that incurable suspicion with which we regard those who propose that certain privileges and advantages should be conferred on them because it will be for the public good that they should enjoy them. The preamble of the Bill, however, boldly takes its stand on the ground of public interest. It runs thus:—"Whereas it is expedient that persons requiring professional aid in architecture, civil engineering, or surveying, should be enabled to distinguish qualified from unqualified practitioners, be it therefore enacted," &c. This beginning would naturally lead one to suppose that the Bill emanated from the public, anxious to protect itself from incompetent practitioners. Nothing, however, can be further from the fact. The scheme for closing the profession, and the Bill, which is the first outcome of it, are the offspring of architects; they come from within the profession itself and not from without, and this alone is enough to justify the outside public in regarding it with suspicion. The general body of mankind is, in fact, wholly in the dark about us; they neither know nor care whether we are organised into a close profession or not. I have even heard it said that nineteen men out of twenty, in a mixed company, if questioned on the subject, would be obliged to confess that they had never even heard of the Institute, a statement so nearly, if I may say so, bordering on profanity, that I should hesitate to repeat it had I not heard it from the lips of a member of the Council of that respected body. Nothing can be more complete than the indifference of the outside world to these plans for revolutionising our condition, except the ignorance of them. There has not been the least sign that any one outside our own ranks is otherwise than satisfied with things as they are, unless it be Lord Grimthorpe, who wrote to the *Times* approving the idea of examination, but saying at the same time that there was nobody among us fit to be examiner. To his support, such as it is, the promoters of the Bill are, so far as I am concerned, heartily welcome; but with this solitary exception, I know of no instance in which the public have given any sign that they require the kind of protection the Bill offers them; nor do I believe that if they had it they would attach the least importance to it. Had it been otherwise, surely the tentative and imperfect tests of qualification, which have been afforded by the examinations of the Institute, would have attracted some attention. But who can recall an instance in which membership or non-membership of that or any other architectural society told to an architect's advantage or disadvantage? What employer ever troubled himself to inquire how many and what capital letters the architect whom he thought of employing could write after his name? On the contrary, it is notorious that an architect may reach the highest grade among his brethren, and, in the estimation of the outside world, without being a member of any architectural society, in proof of which we need look no further than the list of architectural members of the Royal Academy. Obviously, the public are wise enough to trust rather to their own eyes than to those of other people; they are content to judge architects as they do painters and sculptors by their works, and they find in them a better guarantee for good workmanship than would be afforded by any diploma or registered certificate of competency. As to the protection against bad work which it is pretended the Bill would give, the public have already taken the matter into their own hands without any aid from us, by erecting an elaborate machinery of local boards, sanitary authorities, and district surveyors. If this machinery is properly worked, unwholesome and unsubstantial building ought to be impossible, and if bad work does manage to pass through such a sieve it would probably pass through any other that could be devised. If the surveyor does his business it is impossible for drains and soil pipes to convey sewer gas into houses, or for the construction, so far as the plans go, to be insecure, and any subsequent failure must be the result of bad workmanship or wilful negligence on the part of the architect or builder in carrying out the work. Against negligence, of course, no diploma is any protection. Whatever certificates of competency an architect may have it will not be enough that he should know how things ought to be done; the public will not rest satisfied with that, but will insist on seeing that he does it. No one can seriously believe that they will dismiss their local surveyors and shut up their Building Acts and By-laws as unnecessary when the world is supplied with a duly certified and registered body of architects. The regenerate architect, if ever he comes into being, will have to pass local boards and their surveyors just as we unregenerates have to do, and he will be very sanguine if he supposes his diploma will be of any assistance to him or will be regarded by the outside world as affording any security which would enable them to dispense with that of the Local Government Act. So far as public security goes, the proposed measure would add nothing to it; the present machinery is sufficient if properly administered, and, if necessary, its efficiency can be increased and its powers enlarged. Society may safely be left to take care of itself in this respect, and it is certainly no business of ours to undertake to defend it against ourselves. In support of the scheme for closing our profession a great point is made of the analogy of other professions which are already closed. In the paper by Mr. Connon, to which I have already referred, we read: "The demand is no new thing. It has already been granted by the State to the clergy of the Established Church, to military and naval officers, to members of the Civil Service, to physicians, surgeons, and apothecaries, to solicitors and barristers, to chemists and druggists, to dentists and veterinary surgeons, to metropolitan surveyors, to colliery managers, to certified teachers, to ships' captains and mates, and to steamship engineers." But the analogy sought to be drawn between these professions and our own craft is fallacious. Many of them have inherited their privileges and monopolies either from trade guilds and mysteries of the Middle Ages or from ecclesiastical usurpation, and cannot be said ever to have received them directly from the State. Others, again, like doctors and chemists, have to deal with matters of instant life and death, and it is clear that we have a right to feel sure that the man who serves us knows the difference between Epsom salts and oxalic acid. With a still larger number of cases, such as those of officers in the Army and Navy or the Civil Service, District Surveyors, and certificated teachers, we have absolutely no analogy at all, for all these persons are public servants paid by the State, and the public which pays has, therefore, a right to be assured that they are worth their wages before it engages them. In our case there is nothing parallel to this, for the State certainly does not engage to find a practice for those of us who prove, by examination, that we are competent to undertake it. Neither is our case analogous to that of the Church. The established clergy enjoy emoluments and immunities at the public expense, and some of their acts have a certain legal value. It is evidently only in virtue of these endowments and official duties that they are under State control, for in the case of other denominations which enjoy no such privileges there is no State control whatever, and anyone who pleases is at liberty to undertake the office of minister without incurring any pains and penalties. So also in the case of certificated teachers, the Government interferes only where there is a question of receiving a grant of public money. Schools that receive no Government aid may employ uncertificated teachers if they please. The analogy attempted to be drawn between these cases and our own is entirely fallacious, but even if there were anything in it it would not be worth much as an argument unless we are prepared to invite the State to play a paternal part and close every profession that is now

open for fear an innocent public should be imposed upon by incompetent professional men. But it is time to point out that the Bill offers no sort of protection against the worst kind of building that goes on in our midst. It only aims at preventing people who do not know how to build calling themselves architects, a matter which need not trouble us very much, and it leaves the "jerry-builder" unharmed so long as he does not offend our respectability by ranking himself as one of us. There are, of course, bad architects in the world, but there are few of them who do not know how to build houses that will stand, and be wholesome to live in. It is not, so far as I have observed, in their buildings that the evils occur which are generally complained of. I remember a case where, after a family had lived a few days in a new house, all the drains were mysteriously choked up, and where, on examination, it was found that the leaden soil-pipe was carried into the ground and the end turned up and closed without any pipe-drain from it at all; but this house was one of a dozen or so built by a speculative builder without an architect. I remember another case in the present year where a house fell down, which proved to have been designed, not by an architect, but by a plumber. And let it be observed that with cases like these no Registration Bill would interfere. Let the builder call himself a builder, and the plumber a plumber, and they would incur no penalty. If they avoided the sounding title of architect they might go on designing and building these filthy and insecure habitations as long as the district surveyor let them. To make the Registration Bill efficacious it would be necessary to insist on the employment of a registered architect on every building that is put up. This would be protection indeed with a vengeance, but though it is difficult to regard it seriously, I observe in the same journal to which I have more than once alluded that one gentleman actually suggests that local authorities should be required to condemn plans prepared by any other than a properly-qualified architect. Here at last we seem to have the *reductio ad absurdum* of the whole scheme. It begins by shutting the door against all but those who can afford to pay the premium of apprenticeship, and having thus limited the number of architects to a fortunate few, it proceeds to sweep into their net all the building operations of the kingdom. Surely the wildest imagination can go no further, and may well rest satisfied with the glorious prospect of such a good time to come. Before leaving this branch of the subject it is necessary to notice one strange argument. I must, I fear, call it a selfish argument in favour of making architecture a close profession. It is supposed that in some mysterious way the social status, as it is called, of the profession would be thereby raised—an idea which embodies a sort of complaint that architects are not thought of as highly as they deserve. Now, even if it were true, I must object that this is an unworthy argument, which we ought to be the last persons to employ. But I believe the complaint to be wholly unfounded; there seldom was a time when the calling of an architect stood higher in public estimation—certainly there never was a time when so many young men of higher culture and superior position flocked into it. Among people of educated taste it seems to me that architects and their works receive quite as much attention and commendation as they deserve; and I am far more afraid that our profession will become fashionable than that it will be despised. But however this may be, it is certain that it will gain no additional respectability from the Registration Bill, nor will those who now think themselves too low on the social ladder find themselves raised by a single step if that Bill becomes law. Setting aside, however, this Parliament-made gentility, which may be left to dazzle those who fancy it, and the more solid advantages of loaves and fishes, which the Bill is to confer on the new profession—setting aside, in fact, architects themselves altogether—let us turn to the far more important question of what the revolution will do for architecture. The object which its promoters have in view is thus stated by Mr. Connon. He says, "That the largest proportion of the profession are as well educated and as highly trained as they would be under an Act of Registration is probably true. What is sought is the exclusion of those who sink far below the standard which should be the lowest level of fitness." It is intended, therefore, that the unworthy should be shut out by the test of examination; but nothing is said of the exclusion of those who, for want of means, are unable to undergo the compulsory apprenticeship which the Bill requires, whether they are able to pass the test of examination or not. This condition would have the effect of narrowing the field to those who can afford to pay for entering it, and there would certainly be no gain to architecture in this. Everyone must know of cases of men who have risen from assistants into architects and done excellent work, though they have never gone through a regular pupilage, and who would have been lost to the profession had the proposed Bill been in force. But we are told, further, "that the profession of architecture would benefit greatly by the universal education of its followers which would follow from legal registration." And this brings me to what is, perhaps, the most misleading of fallacies, and one which seems to underlie all that has been written and said on the side of registration—namely, the confusion of examination with education. Now, there are several ways of employing examination. Students may be examined by their teachers with a view of seeing whether they have properly understood what they have been told, and of correcting any misapprehensions they may have fallen into. That kind of examination is itself a means of education, and is both useful and necessary to the student, who might otherwise be a long while in discovering his mistakes. It is obvious, however, that the examination for admission to a profession is not of this kind. There is another kind of examination like that at our old Universities, which are both teaching and examining bodies, where the teachers are also the examiners, and do in a manner review in the University schools the result of the University curriculum. This kind of examination is less educational than the other, and many University teachers of the present day advocate the abolition of University examinations as the best thing that could happen for University education. Clearly, however, the examinations at Oxford and Cambridge have little in common with what we are considering. The third type of examination is that for admission to the public services by examiners who have had nothing to do with the education of the candidates, but simply admit or reject them according to their success in answering a certain number of questions. This kind of examination has been adopted in dealing with public appointments, less for the sake of guaranteeing the efficiency of the public servants than for satisfying the people that Government patronage is fairly and impartially distributed. Such examinations are perhaps necessary, but, if so, they are necessary evils; it is obvious they are of no educational value to the student like the first kind, nor do they enable him to gauge his own knowledge like the second kind; they do not follow at the end of a long course of study directed by the same body which conducts the examination, and which therefore knows how to bring out and sift the knowledge of the candidates; they must therefore be general and superficial, taxing the memory rather than the intellect, and they often degenerate into something like a game of skill between the examiner and his victim, in which luck and accident play not the least part. It is to this last class of examinations that ours would inevitably belong, and I can see nothing more likely to divert the studies of architectural students into unprofitable channels, or to put before them a wrong object for their efforts. To work with the object of passing a board of examiners is a very different thing from working to acquire knowledge. The object is not education, but a diploma; and the man will read, not to clear up his own ignorance and fill up the gaps in his knowledge, but to prepare himself with such scraps of information as may come in usefully and help him to fill up his examination paper. Cram, with all its hateful parody of real teaching, would become the order of the day. We should have superficial textbooks by the dozen to save the student the trouble of thinking and searching for himself, and to give him just that kind of smattering which would pass muster with the examiners, without planting in his mind any germ that might afterwards grow up into accurate and scientific knowledge. Independence of thought and freedom of research are impossible under such a system, and without these nothing original can ever be produced. The question with the student would be, not "What do I most want to know?" but "What will pay best in the examination?" That this is the result of the system of examination for the public service is too notorious to be questioned; cramming has become a lucrative profession, and has created a special literature of its own, which all sound scholars would wish to put on the fire back. It is only too certain that the same effect would attend the establishment of a qualifying examination for our own calling; it is the merest fallacy to suppose that it would be an educational measure, and its actual result would be that real architectural education, so far from being promoted, would be positively obstructed. But a greater difficulty than ever presents itself when we come to the subjects which intending architects are to take up. A formidable list is given in a collection of papers on education read at the Conference of Architects last summer, for a copy of which I am indebted, I believe, to Mr. Cates. It ranges from mathematics in its highest branches to the history of architecture in all ages and countries, freehand, linear, and perspective drawing, experimental mechanics, heat, optics, acoustics, electricity with laboratory practice in all; then follow chemistry, also with laboratory practice, and languages, either French or German, or both. All this we are told is comprised in the first year's course of an architect's training in America, and we can only wonder at the astounding powers of digestion which an American architect enjoys if he can get any nourishment out of such a surfeit of good things. But the most surprising thing, after all, is that in all this magnificent programme for an architect's studies architecture itself is forgotten. The student may bring up for examination a pitiful smattering of the great sciences I have enumerated, which is all he can hope to acquire in so short a time, and which he will do well to forget as soon as he can for fear it should lead him into danger, and he may show that he knows something of the various styles of architecture of other ages and of all countries, which is, after all, a matter rather of antiquarianism than of art. He can also be examined in the elements of construction; he can be asked how he would lay his drains, how he would warm and ventilate his rooms, how he would roof over an irregular space, how he would construct a vault or a spire or a dome, or any other part of a building. But all this is not architecture; this is but the builder's art. Architecture begins after all that; it assumes that the building is well planned and constructed—*tout cela va sans dire*—and then it steps in and makes it artistic and beautiful. But this is an intangible operation that cannot be brought to the test of examinations; as well might you try to examine painters or sculptors in their arts, and if there is no actual standard by which to try them, neither is there any by which you could try an architectural design or pronounce its author qualified or unqualified to practise. You can examine a candidate in building construction, and if he shows ignorance you can, without fear of contradiction, pronounce him unfit to be an architect on that score; but what examiner would dare to pluck a candidate on the ground that his design was artistically bad? One may easily imagine the outcry that would be made, the prejudices that would be offended, and the battle the examiner would have to fight with men of rival schools. He would be told at once that he had exceeded his powers, and had no right to prevent a man from earning his bread in the profession because his work did not happen to suit an examiner's taste. And the objection would be a very fair one, for architecture can no more be brought to the bar and tried by a fixed code than the other arts, and no board of examiners would ever dare to attempt it. This being so, it follows that any man who passed in building construction and knew how to lay his drains would, under the proposed scheme of registration, be ushered into the world as an architect; and, not only so, but he would receive, as it were, the Government stamp or hall-mark to certify to the world that he was, in every sense of the word, a genuine architect, although he might be more incapable

than his own office-boy of producing an architectural design that was decently tolerable to an artist's eye. If this is what is meant by raising the status of the profession, we may, in all conscience, pray heartily to be left where we are. It is, no doubt, the impossibility of applying the test of examination to the artistic side of our work that has driven the advocates of higher examination for architects to attach an exaggerated importance to the scientific side. After reading the astounding list of sciences that we are invited to learn, one is reminded, with Mr. Aitchison, of the knight in "Wonderland," who was equipped with a mousetrap lest he should sleep at a place overrun with mice, and a beehive lest he should meet a swarm of bees in his travels. We architects have no occasion to enter the laboratory of the chemist or the physicist; the little knowledge we might pick up there would be worse than useless, and in any real difficulty we should be forced, after all, to rely on the advice of the chemist or physicist himself. We need know no more about optics than the simple laws of perspective. In questions of heat and electricity we must be guided by the advice of specialists, and it is enough for us to know to whom to go, and such general facts about those matters as lie within the reach of every layman. Of mathematics, a very little indeed will be found practically sufficient, and I fail to see in what an architect would be the better for knowing much of botany or even geology. In all these things we must, like other people, be content to accept the result of other men's studies and to believe those who have made these sciences their life's work. Life is not long enough for all this. No architect ever did or ever will make himself master of such a mass of scientific matter, and if we merely dabble in it we shall only be wasting our time, or, at the best, acquiring that little knowledge which is proverbially dangerous. The main point which I want to make clear to-night is that the examination test to which it is proposed architects should be submitted cannot be applied to the artistic, but only to the constructional qualifications of the candidates; that is to say, not all to their skill in architecture, but only to their knowledge of building. Consequently, as it admits men to our profession on mechanical grounds alone, it lowers architecture to the level of a mechanical art, and the change, if it ever came to pass, could not fail to be detrimental to the pursuit of architecture as a fine art. It would open still wider the breach which unfortunately divides it from the sister arts of painting and sculpture, and in so doing would condemn it to a lifeless monotony and hopeless unprogressiveness. It is, believe me, in the extending of an architect's skill into the decorative arts, in the closer union of himself with other artists, in the cultivation of the power to ornament his own handiwork, and so of introducing consistency and harmony into what otherwise is a mere jangle of jarring notes struck by unsympathetic hands, that the hope of architecture among us lies. The true brethren of the architect are the painter and the sculptor, not the surveyor and the engineer, and those are no true friends of our art who would try to persuade us otherwise. Let it not, however, be supposed that I undervalue any plan for protecting the public against bad building. Against bad architecture nothing can protect them except their own good taste, but against bad building it is possible to erect safeguards. This, however, I repeat, has already been done by a legal machinery independent of us, which renders any safeguard of our own devising superfluous. If it be thought that the present system of supervision by local boards is inefficient, that is a matter for the public to see to; it may easily be made more stringent, and its area of jurisdiction may be widened so as to cover the country as well as the towns. So far from wishing to supersede the present system, I would see it improved; in particular I should like to see the office of local surveyor in small country towns undertaken by persons of higher qualifications, and in London and the larger towns I would have the number of district surveyors increased till they were able to exercise such supervision over buildings in progress, that bad construction could not escape detection. Let it not be supposed either that I undervalue the importance of improvement in architectural education; only let it not consist in superficial dabbling in a host of scientific subjects, none of which we shall have time to master, and about which in the end we must take the opinion of experts, but in such matters as really belong to our craft; not in chemical analysis of our building stones, but in practical masonry; not in botanical classification of our timber, but in actual carpentry and joinery; not in the theories of optical science, but in the study of light and shade and perspective effects. A month spent on a building in progress, under the eye of a friendly clerk of works, will be of more use to a student than a year spent in the laboratory of the chemist or the experimental philosopher. It is a piece of training that I always recommend to my own pupils after they have seen something of office work, and I am sure there are few better. Lastly, let me not be supposed to undervalue the constructional part of an architect's work because I say that this part is not architecture, but building. Architecture follows building, and therefore building must precede architecture, and is included within it. There can be no good architecture without good building, and I firmly believe that no man has been, or ever will be, a good architect without being first a good builder. The great masters of old are at least as remarkable for skilful construction as for beautiful design; and it will be admitted that the same is true of the most eminent architects of our own day, who have certainly shown themselves as attentive to strength and convenience as to purely artistic quality in their work. Sir Charles Barry, Mr. Street, and M. Viollet-le-Duc certainly cannot be accused of want of constructive knowledge; no engineer could have more skilfully saved the great central towers of St. Alban's and St. David's from ruin and set them on new and substantial legs again than Sir Gilbert Scott; and I wonder how many of those who boast of their practical knowledge in comparison with those whom they call the "artist architects" would venture to give a lesson in building construction to Mr. Pearson, Mr. Butterfield, Mr. Waterhouse, Mr. Norman Shaw, or Mr. Bodley. There is no more fatal error than to suppose that the two sides of our profession are antagonistic, and nothing can be more injurious to architectural study than to consider the one and ignore the other, as any scheme of examination that can be devised is bound to do. Before we set to work on any revolutionary plans and upset our present constitution, let us consider how architecture in England compares with that of other countries where it enjoys State protection and control, and where something like State education is provided for its students. I quote from a paper read at the late Conference by Mr. Phené Spiers, whose knowledge of the training of architects both in England and France entitles him to speak with authority. He says:—"There is no national school of architecture here; there is no traditional teaching of 200 years as in France; so far as architectural design is concerned I am inclined to think this is a positive advantage, and that in consequence English architecture is at present in a much more healthy state than that either of France or Germany. In ecclesiastical architecture it has always been so, and of late the progress made in domestic and town architecture has been such as to outstrip entirely our foreign contemporaries." One may without vanity accept this picture as a true one. Travel where one may on the Continent one cannot but be struck by a certain tameness and hardness, and a cast-iron monotony that characterises even the best work one sees. Perhaps our worst English work is worse than anything we see abroad; but our best is incomparably better. It bears signs of life and progress and of wholesome originality that are wanting elsewhere; and foreign architects themselves now look on English architecture and architects with a respect unknown before. The cause of this may be found in our freedom from the shackles of State control on the one hand, and the enervating influence of State protection on the other. Liberty and free trade are necessary to the growth of art, and any measure for controlling or regulating the pursuit of architecture stifles that element which belongs to art, and brings into prominence that which is purely mechanical. In Italy and Austria the architect is a man who has failed to qualify himself as an engineer. It is the engineer who restores ancient buildings and builds new ones, while the architect figures as little better than a clerk of works. Can anything more expressly illustrate the tendency of legislative interference to eliminate that element which constitutes the difference between a mechanical and a fine art? Such would be inevitably our fate if architecture were made a close profession. Hitherto we have been free; in our freedom lies our hope of the future; our true wisdom lies in guarding it jealously against State interference and bureaucratic control. If engineers and surveyors choose to put the chain round their necks it is no affair of ours; but let us, at all events, beware how we sacrifice that proud independence under which we have won for our country a foremost place in the ranks of art with the promise of still greater achievement in the future.

SCHOOLS FROM AN ARCHITECT'S POINT OF VIEW.

At the annual meeting of the Worcestershire Association of Church School Managers and Teachers, held at the Guildhall, Worcester, on Saturday, a paper on the above subject was read by Mr. Ernest Day, M.S.A., the Sheriff of Worcester. Mr. Day pointed out that a good plan for boys and girls' schools might be carried out by providing a lofty central hall or schoolroom, communicating with classrooms for boys on the ground floor, and over these rooms classrooms for girls communicating with a gallery running round the central hall, the girls of course having separate approaches, but so arranged that they might have access to the central hall to mass the whole school as occasion might require. This plan was on the lines of Sir Titus Salt's schools at Saltaire; but he thought it questionable if the Education Department would sanction such a scheme. His remarks on school planning would have regard more particularly to elementary schools, and he would endeavour to furnish a few particulars which appeared to him essential points to keep in view. The site should be selected in as central a position as possible in the district where school accommodation was needed. It should, if practicable, be of ample size to afford good playgrounds and to secure plenty of light and a good circulation of air round the buildings for the purposes of ventilation. Good-sized, properly-paved playgrounds were very desirable in order that children might enjoy reasonable recreation which added much to their physical strength and greatly augmented their mental faculties. The general arrangement of each school must depend upon the number and classes of children; if a mixed school of say, 622 children, he should apportion as follows: allow for boys 171, girls 171, infants 280, and generally a portion of about one-third class accommodation for boys and girls in each case, although where funds allowed he preferred providing a general room and classroom to accommodate respectively all the children in the boys and girls' schools. The floor area should not be less than 10ft. per child, except for infants, which would suffice at 8ft., and the cubical air space for each boy and girl should be 200ft., and each infant 130, although the Department would sanction a much lower standard. The partitions or doors between classrooms and the main room should be of half glass, and so placed as to allow the master or mistress to secure supervision of the entire school. The design of school buildings must of necessity vary according to outlay and local materials; but speaking generally the aim should be to impart some distinct architectural features. As to fittings, stools with inclined seats should be provided for the teachers. They would give a slight rest to the back, and in case a teacher was standing for any length of time would afford considerable relief. With regard to the heating of schools, open fireplaces were in all cases an advantage, as they looked cheerful and served as good exhaust ventilators. It might be found, however, that to warm a school exclusively with open fires was insufficient during very cold weather, or involved too much fuel, time, dirt, and attention; and in such a case he should recommend a hot-water apparatus, the pipes being so arranged as to distribute the heat as equally as possible, and care

being taken to secure a sufficient supply of fresh air. If possible, even with a hot-water apparatus, one fireplace should be used in the large rooms. Proceeding to deal with the question of ventilation, the speaker said a large portion of the upper part of each window should be made to open, and there should be vertical air pipes, or shafts fitted with flaps or valves for the admission of fresh air. On the apices of roofs—he strongly recommended for all schools open roofs, ceiled to the underside of the rafters—extract ventilators should be placed. In the discussion which followed, the Rev. W. R. Carr expressed disapproval of Mr. Day's views as to the advantage of open grates, nor did he think that stools should be provided for teachers; but the Diocesan Inspector, the Rev. C. T. Hunt, on the other hand, approved of the provision of stools for teachers, and, like Mr. Day, he also admired open fires. If the general lines of Mr. Day's paper had been acted upon by builders of schools forty or fifty years ago it would have been much better for everybody. One of the great drawbacks to church schools was the wretched design and arrangement of some of them, and it was marvellous what good work was done in spite of such miserable surroundings and conditions. Mr. Edgington considered that a teacher could not carry out work properly from them; and while open grates had advantages in getting rid of bad air, but they did not warm a school sufficiently. Mr. Houghton did not think open fires answered except in narrow rooms. As to stools for teachers, there were times when their use might be permitted. The Sheriff, in replying, said he thought his suggestion as to stools had been misconceived. He did not mean tall stools on which teachers would sit, but something inclined at a considerable angle which they could rest against without sitting down. His opinion as to the desirability of providing such means of rest was strongly confirmed by medical men. As to the allowance of air space per child, in the London board schools 130 cubical feet was the minimum, but that was insufficient. He considered 200 cubical feet for boys and girls was something like a reasonable allowance; and he had even allowed in schools for 230 cubical feet.

ST. CATHERINE'S, BROMLEY, KENT.

THIS house was erected for Mr. J. E. Walker, in the Holwood-road, Bromley, Kent, on an elevated gravel site, commanding picturesque views of the surrounding country, the materials used being stock bricks, relieved by red-brick plinths, quoins, arches, &c., and moulded red-brick sills and tablets to the windows, and moulded red-brick string at the first-floor level, above which height the brick walls are rendered externally with cement and shingle, roughcast, with fine moulded cement sills, &c., and cove at underside of eaves. The roofs are covered with dark brown tiles, with bright red ridge tiles; all the external woodwork being painted dark oak, excepting the window sashes, which are cream white. The works were carried out by Mr. Crossley, of Bromley, Kent, from the designs, and under the superintendence, of Mr. H. Percy Monckton, A.R.I.B.A., architect, of 32, Walbrook, London, E.C.

ROOF COVERINGS.

IN a recent paper on "Construction of Buildings," the author, an American architect, alludes to the value of porous terracotta sheathing set in lime mortar, and bolted to T-irons, the whole surface covered with pure asphaltum, with roofing prepared paper rolled on while the asphaltum is still hot. The paper then adheres closely, and prevents the passage of moisture or rain. The valleys, hip rolls, gutters, and flashings are proposed to be formed in copper; the whole is then slated, bolted with countersunk heads, and with nuts and washers. Such a roof is found to retain the heat during the cold weather. Few of our roofs are so constructed. Very often the felt sheathing and boarding are omitted, and the only covering is the cold-conducting slates imperfectly laid. The result is disastrous to comfort in a house. The artificial means of heating employed are unavailing in maintaining a comfortable degree of temperature, for the heat is wasted on cold surfaces, which speedily conduct it away. Unfortunately, expense is the chief consideration in building at the present day, and this is the reason why houses are so seldom provided with felt or paper sheathing. In churches, schools, and the better class of residences, the roofs are boarded and felted, adding much to the degree of warmth maintainable, and, we may add, materially saving the fuel required to keep up a desirable temperature. As the warm expired air ascends, it is quickly chilled by a cold roof, and falls to be rebreathed by those in the church or school, thus making ventilation more difficult. Those who contract for warming these buildings appear to lose sight of the roof in their calculations. In determining the loss of heat they adopt certain coefficients for the loss by walls, window surfaces, floors, &c., but omit the heat abstracted by the roof, which is very considerable. We have still to educate the builder in the choice of materials. In this country, exposed to all variations of temperature, the covering of roofs with felt or asphalted material like paper ought to be considered as necessary a precaution as slating it. Our old thatched and tiled houses were far more retentive of warmth than any of the modern slate-covered villas erected round London. The provision of a layer of felt or prepared paper like the "Willesden" below the slating would insure a certain amount of retentiveness and warmth in the rooms of a house that would quickly compensate for the trifling extra cost entailed. In an ordinary roof the cost would not be more than from £4 to £5 to lay the asphalte roofing felt, if we reckon the felt to be 2d. per foot super. It will be probably a long time before the comfort of a house will be thought of sufficient importance to make a building by-law of roof construction; but the architect is certainly justified in adopting everything that can insure the health and comfort of his employer by the employment of reasonable and inexpensive materials.

Mr. John Lowry, the head of the extensive firm of builders and contractors known as John and Wm. Lowry, of Corporation-street, Newcastle, died on the 14th inst., aged 63 years. The funeral took place on Saturday, and was attended by Messrs. W. H. Dunn, G. C. Adamson, G. Connell, and other architects, and very many representatives of the building trades.

THE BISHOP'S THRONE, TRURO CATHEDRAL.—A CATHEDRAL CHURCH.—NEW BANK IN LOMBARD-STREET.—GORDON DWELLINGS, CAMBERWELL. — THE WEST TOWERS, LIEBFRAUEN KIRCHE, HALBERSTADT.—AN INGLE NOOK.

OUR LITHOGRAPHIC ILLUSTRATIONS.

TRURO CATHEDRAL—THE BISHOP'S THRONE.

This is made in Burmese teak, and is a fine structure, with central seat for the bishop, and chaplains' seats on either side. The book-front of the bishop's seat has sculptured figures, representing the Archbishop of Canterbury, the Bishop of London, and the Bishop of Truro. These figures, which are sculptured out of the solid, are in canopied and crocketed niches under the bishop's book-board; the fronts to the chaplains' seats are traceried, canopied, and crocketed. The divisional ends between the book-front of the bishop and the chaplains terminate with poppy heads, with sculptured figures, representing the four great doctors of the Western Church—St. Gregory the Great, St. Jerome, St. Ambrose, and St. Augustine. Below the poppy heads, on the same ends, are sculptured a winged beast and a pelican, symbols of might and love. The two ends of the fronts to chaplains' book-fronts are traceried, and terminate with sculptured poppy heads of animals entwined in each other in combat. The three seats are misereres, divided as stalls, with carved canopies over; that to the bishop's seat is supported on clustered columns. The back of the seat is traceried and sculptured, the central panel having the archbishop's mitre and a shield under the arms of the archbishopric of Canterbury, impaled with those of the present archbishop, Dr. Benson. The panel on the eastern side contains the mitre and arms of the Bishopric of London, impaled with those of Dr. Temple, the present Bishop of London and late Bishop of Exeter, out of which see that of Truro was formed; and the panel on the western side contains the mitre and arms of the Bishopric of Truro, impaled with those of Dr. Wilkinson, the present Bishop of Truro. The ends to the chaplains' seats which run up and support the richly-groined canopies have on their fronts sculptured representations of the Archangels St. Raphael and St. Michael—St. Raphael in armour on the eastern side with a flaming sword in his hand, and St. Michael on the western side in armour, striking a dragon at his feet with a sword. The seats are surmounted by elaborate groined canopies of varied design, and terminating over the bishop's seat with a crocketed spire, round which cluster a forest of pinnacles with flying buttresses. The whole work is sculptured out of the solid wood, and was designed by Mr. J. L. Pearson, R.A., and executed in its entirety by Messrs. Luscombe and Son, of Exeter.

NATIONAL GOLD MEDAL DESIGN FOR A CATHEDRAL.

We published a plan of this cathedral church with a longitudinal section of the design in the Building News for Oct. 21st last, giving at the same time some particulars of the matter. To-day we print the eastern façade of the building showing the choir and chapter-house. The central and western spires also figure in the composition. Mr. Fred. Whitwell, of York, is the author of the design, for which a National Gold Medal was awarded to him by the Science and Art Department.

NEW BANK, LOMBARD-STREET, E.C.

We give an illustration this week of the new banking premises of Messrs. Lloyds, Barnetts, and Bosanquet (Limited), Lombard-street, E.C., which have been erected from designs of Mr. J. A. Chatwood, F.R.I.B.A. An account of this building was given in our issue for April 22 of this year. The lower portion of the façade is of Cornish granite; the upper portion of Portland stone. On the ground floor is a large banking room lighted on three sides; the back portion of the bank is divided by a glazed partition of mahogany into rooms for the managers, waiting rooms, &c. In the basement, which is faced with white glazed bricks, are the usual strong rooms, rooms for the clerks, lavatories, &c. There are offices on the mezzanine floor, looking into banking-room; the board room, &c., are on the one-pair floor looking into Lombard-street. Messrs. Colls and Son, of Moorgate-street, are the contractors.

GORDON DWELLINGS, POUND-ROW, CAMBERWELL.

This block of buildings, situate in Pound-row, Church-street, Camberwell, has been erected by Messrs. Colls and Sons for themselves on ground forming a portion of the Church-street improvement scheme, and purchased from the Metropolitan Board of Works. Built as a commercial speculation, and intended to supply the maximum accommodation at the minimum rent, not much license could be given to the architect, Mr. Ellis Marsland, M.S.A., in the way of architectural effect, although an attempt has been made to relieve somewhat the barrack-like appearance this kind of building is apt to assume. The chief features in the design are the adequate air space with which the building is surrounded, the abundance of light supplied to each room, and the safe exit in case of fire, provided by means of the staircases being detached from the several blocks, and communicating therewith by fireproof galleries and corridors. Each suite of rooms is complete in itself, consisting of living room with kitchener, two or three bedrooms, sink, pantry, w.c., and coal cellar, with adequate laundry accommodation on the roof. The several floors are formed of wood joists filled in with concrete, composed of coke breeze and Portland cement, making practically a fireproof floor. The roofs are formed of the same material, and covered with asphalte, forming an excellent drying ground, and also a space for recreation. The whole buildings are divided into four blocks, containing 125 rooms, and are five stories in height. The sanitary arrangements are in accordance with modern sanitary science, and the water supply is contained in a large tank containing 5,000 gallons, placed on the top of the detached staircase, forming a tower. The top stone (on which are sculptured the arms of the late General Gordon and the present chairman of the Metropolitan Board of Works) was laid by Lord Magheramorne, K.C.B., with all due ceremony, on June 28th, 1885.

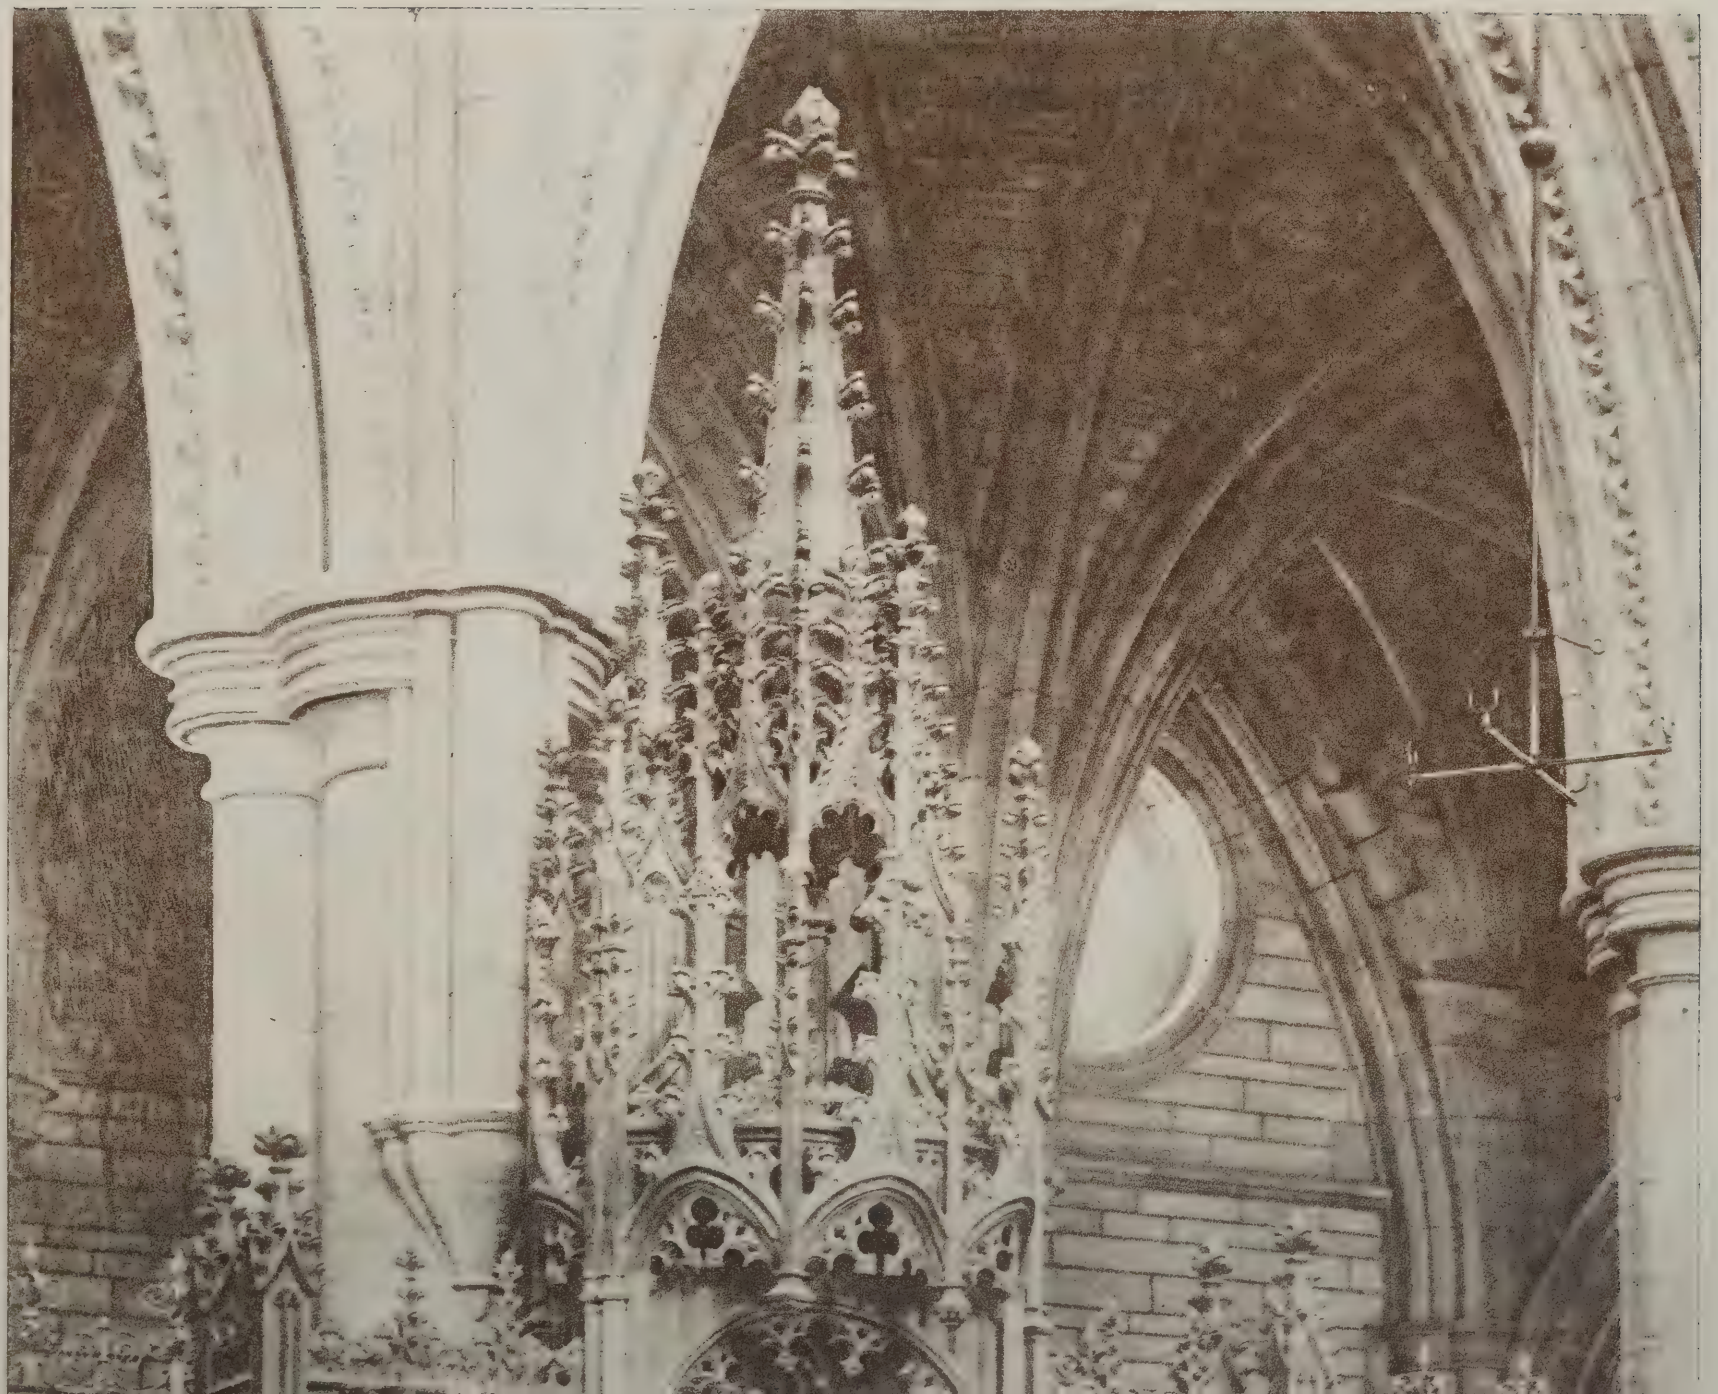
WEST TOWERS, LIEBFRAUEN KIRCHE, HALBERSTADT.

Halberstadt, a town of some 30,000 inhabitants, lies within easy distance of Brunswick, on the slope of the Hartz Mountains, and is a most fruitful field for the architectural student in search of the picturesque. It is remarkably rich in half-timber buildings, which display a wonderful variety of outline with detail of a very elaborate character. The Rath-haus is mainly of 15th-century Gothic, with Renaissance additions. The principal ecclesiastical building is the Cathedral of St. Stephen, originally Romanesque, though the greater part has been rebuilt in Decorated Gothic; whilst across the Domplatz is the Romanesque Liebfrauen Kirche, with the very fine towers of the form so generally adopted by the early German architects, shown in the sketch. The church consists of nave with aisles, transepts, and circular-ended chancel; and in addition to the western towers has octagonal towers in the angle of aisles and transepts.

H. H. McC.

AN INGLE NOOK.

This is a room specially fitted up by Messrs. Hindley and Sons at their show-rooms in Oxford-street. The greater part of the furniture, including the panelled wainscot, was enamelled in cream colour. The chair shown was a copy of a Chippendale; the angle cabinet is a pretty example of its type. It will be noticed by many of our readers that the ingle nook was shown at the last Architectural Association *Conversazione* at the Westminster Town Hall.



SCHOOLS OF ART.

Leeds.—The annual meeting of the Leeds Schools of Art and Science was held in the Albert Hall on Friday evening. Professor Silvanus P. Thompson (Principal of the City and Guilds of London Institute's Technical College) presided. Mr. A. Stephenson (head master of the Art School) reported that during the past year there were 595 students in attendance. There had been some excellent work done, but the engagement of a special teacher for modelling had not been followed by any adequate result. In the painting classes, though there were one or two failures in minor points, the general standard of the work was not inferior to that of former years. Mr. J. Wertheimer (head master of the School of Science) reported that the results of the work for the session 1886-7 were quite equal to those of preceding years, and there had been several successes in the honour stages, and a large increase in the number of students. By the increased accommodation which would be gained when the new buildings were completed, they hoped to greatly extend and improve their work.

The Female School of Art.—The Countess of Rosebery on Wednesday distributed the prizes to the students of the Royal Female School of Art, in the Freemasons' Hall, Great Queen-street. The annual report stated that the Queen had inspected the drawings sent to her by the students with much satisfaction, and expressed the wish to purchase water-colour drawings by Catherine Howard and Emily Lucy Varley. During the twelve months 171 students received instruction in the various branches of art taught in the School; and on the 9th of April last 2,010 works were forwarded to South Kensington for examination and competition for rewards. Nine national awards were accorded to this school. The chief prize winners were as follows:—Scholarships.—The Gilchrist Educational Trust Scholarship, £50, Ida Marion Kirkpatrick; the Brightwen Scholarship of £10 to Ruth Harman; the Duchess of Westminster's Scholarship of £20 to Edith Harwood; the Clothworkers' Scholarship of £30 to Edith Mary Flack; the Queen's Scholarship of £60 to Edith D'Oyly Rowe; Queen's Gold Medal, for a group of still life painted in water colour, cluster of bananas, grapes, pomegranates, &c., to Catherine Howard, 205, Amherst-road, Hackney. National Queen's Prizes.—Helen Bramwell Norris, Helen Phillips, Florence Annie Shindler, Mary Augusta Spackman, Charlotte Maria Alston. National Bronze Medals.—Ellen Leigh Badcock and Emily Lucy Varley. National Silver Medal.—Catherine Mary Kitson. The Rev. Prebendary Whittington stated that out of the fifteen Gilchrist Scholarships that had been awarded, thirteen had been gained by the students of the Royal Female School of Art.

Internal alterations have just been completed at All Saints' Church, Southampton. The old pulpit, reading-desk, part of the north gallery, and the seats across the eastern portion of the church were removed, and the space thus cleared is now occupied by a chancel, with the organ rebuilt on the north side, and vestries on the south side. The chancel is separated from the nave by an alabaster screen with panels of inlaid marbles, surmounted on either side of the central opening by two seven-branch gas standards, and on the north side by an alabaster pulpit with marble pillars. The chancel has been furnished with oak credence table and stalls. The works have been carried out from the designs of Mr. Mardon Mowbray, of Oxford.

In a competition for heating and ventilating the town hall at Congleton, the plans of Messrs. Sugden and Sons, of Leek, have been awarded the first premium by the corporation.

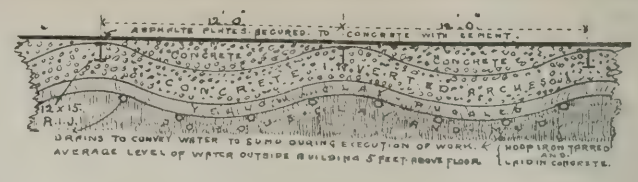
AN INGLE NOOK.

THE RELATIONS OF ARCHITECT, SURVEYOR, AND BUILDER.*



(*Continued from p.* 893.)

CLAUSE 16 of the Institute form of contract defines the course to be taken in case of bankruptcy or unjustifiable suspension of progress. In the event of the contractor's bankruptcy, it is generally advisable to let the trustees finish the building. Similarly, when a contractor is in pecuniary difficulty, it will often be far better to help him by judicious advances for wages, or guarantees for materials, or both, than to seize. I need not remind you that this course requires careful management, and you must, moreover, guard against the removal from the premises of materials bought with the building owner's money. If you take possession of the building and get a contractor to complete it, you will find it impossible to obtain a tender for anything like the amount of the balance of the contract sum. But the safest plan in any doubtful case is to insert a condition stipulating for securities something like this – The contractor to send in with his tender the names of two responsible sureties, who are willing to be jointly and severally bound with him in the sum of (so much) for the due completion of the contract, and the bond to be executed at the time of the signing of contract. Clause 19 provides what may be done in case of default of payment by building owner, or the delay from any proceedings taken by other parties, as adjoining owners (for instance), and the payment for the work already done. If the work be stopped, the contractor must furnish you with a detailed statement of his claim, with items priced, to show how he makes up his estimate of loss. As the building will probably be finished at some time or other, it will be found advantageous to have the prepared work delivered at the building; if finished work, the price will be the contract price, minus the cost of fixing. The claims for use of scaffolding under these circumstances are usually exorbitant. These may be tested in various ways: by approximately valuing the scaffolding, and comparing this amount with the amount demanded; by reducing the amount of demand to a percentage, and comparing it with amount of contract. When scaffolding has been described in a bill of quantities, the claim may be regulated by a proportion of the price in bill. Clause 20 is an arbitration clause. The expediency of admitting or opposing an arbitration clause has been argued from various points of view. Some architects will on no account submit to it; they instead adopt something like the following: "If any disputes or differences should arise between the employer and contractor as to the quality of materials or the manner of executing, or as to any charge, account, or other matter connected with the contract, such disputes or differences are to be settled by the architect, whose decision shall be binding and final on both parties." It will be maintained by some that the architect is the natural arbitrator between employer and contractor; but I doubt whether such unlimited irresponsible power is a healthy condition for any man. It is pretty certain that you can get no builder of standing to agree to such a clause. Supposing you have adopted an arbitration clause, and that there are questions at issue, care should be exercised that only the kind of questions provided for by the conditions be submitted (the Institute conditions except from its operations Clauses 9—10), and progress will be accelerated by settling at first what points shall be dealt with. As a building arbitration usually turns upon measurements and prices, it seems reasonable that a quantity surveyor should be selected for arbitrator, as he, from the nature of his work, is much more frequently engaged upon such questions than an architect. If the scientific training of the average architect were what it should be, I should say the architect would be the best. If the points in dispute are purely or mainly legal, a lawyer is the proper person. But I need not remind you, gentlemen, that it is nearly always expedient to pay rather than refer. A referee is one of the most expensive luxuries with which I am acquainted, except a lawsuit. Moreover, the disposition of the arbitrator to favour the contractor is notorious. If avoidance is, however, impossible, go direct to your arbitrator, not bringing an action first, which greatly increases your expenses, and then I can only repeat the advice of Polonius, "Being in, bear't that the opposed may beware of thee." If the selected arbitrator prove obnoxious, it should not be too readily assumed that he cannot be removed. This can be done in various ways. It is a common error to conclude that when you have instructed your solicitor in a case of dispute, you are to take no further heed until the matter is ready for hearing. My experience has been that you should watch the whole progress of the case as it proceeds. You will generally find that you can make valuable suggestions, and your attention is often sufficient to turn a desperate case into a good one. It is a reasonable arrangement to let all your general clauses—I mean such as apply alike to all trades—follow the conditions. There are generally stipulations that contractors shall supply all sheds for housing materials, temporary screens, pumping, &c., that may be necessary. It will be found at completion, perhaps, that these things, or some of them, have not been used, and the architect concludes that some of the amounts shall be deducted. He is met by the objection that these items are speculative, and at contractor's risk; that, although they happen to have cost nothing, yet they might have cost much more than the sum included, and he would have been bound to do then without extra charge. He would also claim that some of the similar items had cost more, and would ask for the difference, which seems reasonable enough. If you reconsider one item you reopen the remainder. The rule to commence all clauses which are at contractor's risk with the word *allow*, and all sums specifically provisional with the word *provide*, puts these matters generally on a satisfactory footing. The clause providing for the accommodation of clerk of works comes reasonably here. Perhaps I may be allowed to express my opinion of the introduction of a clerk of works without any intimation of it in quantities or specification. This is sometimes done, and I do not think it is just to the builders. The intention that the works shall be done under the supervision of a clerk of works should always be stated before obtaining tenders. Here also most conveniently follow clauses such as permission to dig sand and gravel in the ground, and it will be expedient to test its quality before you introduce such a clause. Permission to use it is implied by the permission to dig. This is also the place to state the materials of which you require samples (the best way to insure satisfactory quality), such as brick, tiles, terracotta, slates, locks, &c. One finds many specifications weak as to attendances. Each trade to attend on all others, and to do all jobbing required, is always interpreted as excluding gas-fitter, bell hanger, hot-water engineer (not domestic hot-water supply), ventilating engineer, lift engineer. All these attendances should be specially described or a sum provided for each. But in the case of work done by specialists, a little inquiry beforehand will afford you sufficient information to describe the work and so avoid a provision. Such provisions are the chief sources of unexpected expense. It is advantageous to have all the provisional sums together after the general clauses instead of distributing them though the trades; one sees then at a glance all the provisional sums together. Instead of providing rods of brickwork, cubic feet of timber, &c., I think it preferable to provide a sum of money. Only in rare cases is it safe to provide less than 5 per cent. on the estimated cost to cover extras; but if you do provide material, you will find it convenient to place it in this position for the reasons I before mentioned. It will save you time and trouble if you describe the articles, for which a sum is provided in the trade to which they belong. Taking tile paving for instance. In the Plasterer a clause might appear: "Pave with Minton's 6in. by 6in. tiles, p.c. 10s. per yard, laid and pointed in cement, the hall and ground floor" and corridor as far as swing door, "a sum provided for this paving; see provisions." In the provisions, provide for 100 yards of tile paving p.c. 10s. per yard at the works, and allow for packing, carriage, and laying in Portland cement. The treatment of provisional items in this manner saves much referring to notes. In the case of a separate contractor for ironwork, this will prove to be specially valuable. A tabulated list in the section of specification Founder and Smith, stating size of section, length, span, weight per foot, and what it supports for every joists and girder in the building, stating that a sum is provided. In your provisional list you can then put it thus:—"Provide for 70 tons of rolled joists £560, and allow for unloading, fitting in hoisting, fixing, and attendance on smiths." One may add, while on this subject of provisions, that the best way to obtain good ironmongery is to make a list of it, and get an estimate from a high-class maker of builders' ironmongery, especially the locks. It is in such cases convenient to put the provisional sum in the list of provisions, describing each article of ironmongery with the joinery in the usual way, and stating by a clause in the preamble of joiner that a sum is provided for all ironmongery except cups and screws, but that contractor is to fix it. Another important consideration as to provisional sums is the settlement, by the specification, of the questions of packing, carriage, profit, and fixing. As to packing and carriage in a clause at the head of the list of sums, say: "On all things for which a sum is provided allow for packing and carriage." As to profit, say: "All p.c.'s to mean prices at the works, minus trade discount, but not discount for cash." It is also expedient to say something like this in substance: If contractor desires a profit on any of the following provisional sums, he is to add it to the sum in each case, and such of these amounts as are not used will be deducted with such profits from the amount of contract. The enormous proportion which some trade discounts bear to the net price, may be defended in cases where articles are of small value and very minute fluctuations occur; but many of them are unjustifiable experiments for deceiving the inexperienced or unwary. In the better specifications that I have seen, there are a few general principles which I think commendable. One is the practice of commencing general descriptions with the exceptions, and following with the rule. Another is specifying completely and separately, things complete in themselves, like outbuildings, fences, conservatories, &c., instead of mixing up their items with the general work. Observe, too, you may shorten your specification considerably by commencing each trade with a nnmber of general clauses, such as, "All iron butts to be wrought, all door and window-frames to be grooved where required to receive finishings." When there are quantities for a building, it is most convenient for the architect to furnish his surveyor with rough notes of the special requirements, the surveyor producing the complete documents from these and the quantities. I am afraid I have been trenching upon the subject of the paper on "Specifications" that Mr. Searle has kindly promised; but I am quite sure he will furnish you with a great store of further information on the subject, for there is plenty more to be said; but I refratn for this reason from going further into the subject. The contract will be most satisfactory if you select a number of builders of equal position, and consequently similar capacity for doing good work, and it should be remembered that there are some builders who never saw, and have no conception of good, work, while there are others who would find it difficult to produce bad. To the majority of you, gentlemen, I need not enlarge upon the fact that the difference between good and bad work, if represented in the form of a percentage, would be very small indeed; it is more a matter of tradition and habit of particular firms. One has heard at various times sentimental arguments against the present system of tendering. All contracts (say they) should be fair between employer and contractor; their proper object should be to insure the employer fair value for his money, and the builder proper payment for his work; and this, they maintain, the modern mode of contracting does not do. No doubt the best work is to be obtained by selecting a builder of high reputation and paying him his own price; but your desire for good work would not always be justified even under that arrangement. All things considered, I think the present system offers the fewest evils. The principle of competition runs

* By JOHN LEANING, M.S.A. A paper read before the Society of Architects at St. James's Hall, Piccadilly, Dec. 13, 1887.

through all businesses, and is truly described as the life of trade, and I do not see any cogent reason for the application of different principles to the building business. But the keenness of competition imposes stronger obligations than ever upon architects and surveyors to avoid straining contracts beyond their legitimate limits, and to exercise special care that improper risks or liabilities are not imposed upon the builder. The form of contract is the next consideration. The solicitor's contract is generally diffuse; his usage is to embody the greater part of the conditions. This is not necessary; nothing is required beyond the following:—A description of the position of the building, the names of the contracting parties, an undertaking on the part of the contractor to erect the building for a certain sum, to the architect's satisfaction, according to drawings and specification and conditions (and quantities, if they are to form a part of the contract). An undertaking on the part of the employer to pay the aforesaid sum for the building on its erection and subject to the conditions. The drawings and specification are identified by notes referred to in contract, contract drawings, and specification being all signed by ths parties. In fact, one may take it as a rule that the shorter the contract document is, the better, so long as it clearly embodies the intention of the parties to it. It is best to have a form of tender; the offer is then properly defined, and if a schedule of prices for labour forms a part of it, the advantage is considerable. While on the subject of tenders I may allude to the acceptance of the lowest. When a number of builders are invited to tender, I think the lowest should invariably be accepted. When the tender is an open one, the case is considerably different, and I think a builder may be selected with less regard to his standing in the list. To the erection of a building under a schedule there are various objections. It generally involves a larger cost than a contract for a total sum, and the uncertainty as to time of completion is another important objection. So much has been said and written about quantities that I need not trouble you with more than a few words. If you want good work, I think you must have quantities. The cases in which they do not effect an ultimate saving are rare, and I think, in justice to the builder, they should form one of the bases of the contract—indeed, in the majority of cases, they are so practically, if not legally; and so far as my experience goes, without any of the dreadful consequences which imaginative persons have conjured up. It certainly does seem anomalous for an architect, with the building owner's concurrence, to order the preparation of quantities which they practically repudiate as soon as the contract is signed. I might go on to speak of the settlement of accounts; but I have already, I think, exceeded the reasonable length of a paper of this kind. A very good paper on "Settlements" was read by Mr. Riddett a few years ago before the Architectural Association, which I daresay many of you heard. I commend it to those who have not as a very sensible statement of the subject. After all, the architectural diploma is one of the main reasons of our association in this society. Looking at the position of the profession generally, one cannot but feel naturally indignant at the anomalous position of the architect, that men of scientific attainments and high artistic ability should be classed with the large crop of mere pretenders, and I must confess my astonishment at the unworthy motives which have been imputed to us. I trust we are all actuated by a desire to leave the profession better than we found it, and I do not fear that such motives will lead us to a substantial reward. The truly noble profession of architecture occupies at present an abnormal position from which I have confidence that it will shortly emerge. The conspicuous improvement of late years in the character of our architecture must impress us with good hope of its future, and we have good reason to congratulate ourselves that we have a share in those splendid traditions of art which the architects of this time are so worthily handing down to posterity.

The Metropolitan Board of Works have sanctioned the application of the vestry of Hammersmith for a loan of £29,000 towards the purchase of Ravenscourt Park.

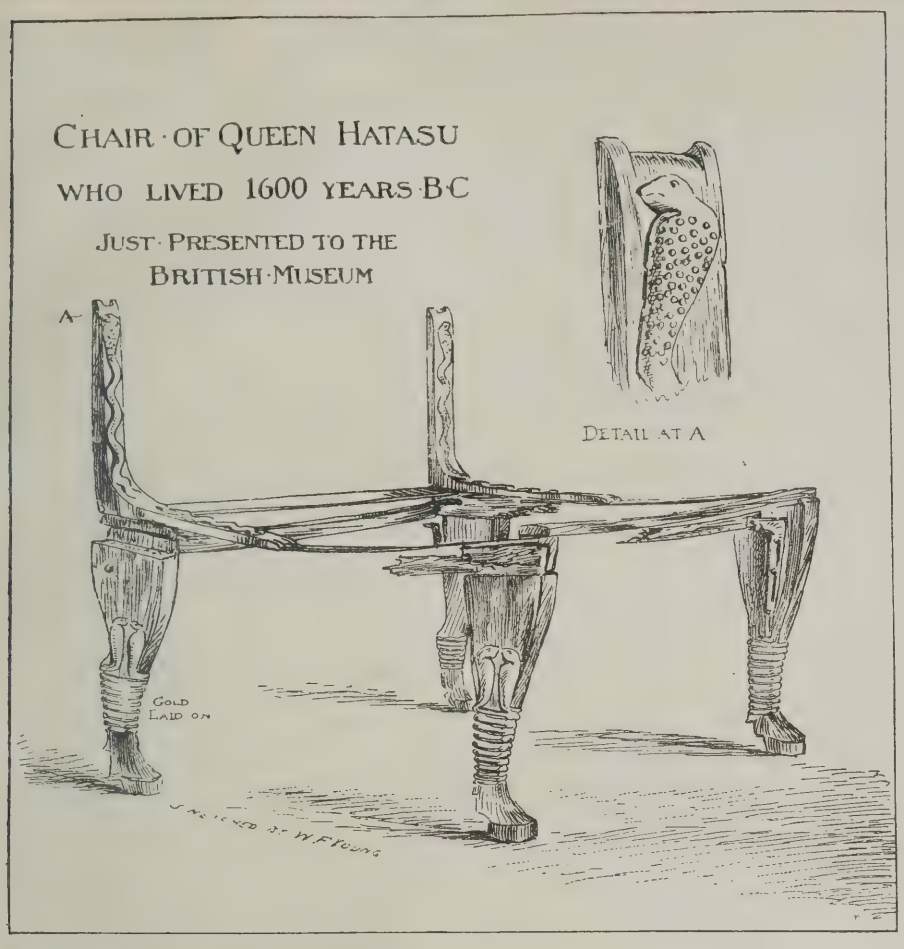
STRATFORD CO-OPERATIVE AND INDUSTRIAL SOCIETY, LIMITED: CANNING TOWN BRANCH.

THIS building comprises the first portion of a block recently erected in Rathbone-street, Canning Town, Essex. The elevation is designed to give as much light as possible; the mullions are of cast iron; the two lower cornices and trusses are of Portland stone, and in the upper cornice and arches Brown's moulded and ornamental white bricks are used, the shop-front is executed in walnut. A very important feature in this building is the basement floor (of which we give a section). The site once formed the sloping bank of a stream, now some 18ft. below the present surface; the ground excavated for foundations and basement was of a soft, muddy clay, through which the water freely ran with considerable force, the neighbourhood being very close to the river Thames, and the street-level about 8ft. below Trinity high-water mark. The difficulty has been successfully overcome by the introduction of 12-in. rolled iron joists, pinned in side walls, and bolted to centre stanchions, to form skewbacks for inverted concrete arches; 5-in. rolled iron joists were also placed about 4ft. apart on the bottom flange of 12in. joists. Asphalte plates were cast on site with coarse gritted backs, and were bedded on concrete with neat Portland cement, and afterwards finished with a rubbed surface of asphalte, laid in the usual way; similar plates were also fixed vertically to walls. The upward pressure on this floor is between six and seven hundred pounds per square foot. Mr. James Morter, of Stratford, was the contractor, and the whole of the work was designed and carried out under the personal supervision of the architect, Mr. Henry Poston, of 39, Lombard-street, E.C., and Forest Gate.

STUDENT WORK AT THE INSTITUTE.

DURING the week an exhibition has been on view at Conduit-street comprising a series of sketches and studies chiefly by students competing for prizes. A feature, however, of the collection specially to be noted consisted of several beautiful drawings by the late Mr. George Devey, whose houses and clever restorations of old domestic buildings made for him a name as well as a fortune. The sketches to which we refer are, without exception, slightly finished in water-colour, though a few are more correctly described as pencil studies partially washed in tint to show local colour and materials. In all of them there is a marked knowledge of detail and a breadth of treatment which clearly indicate an artistic power and thoroughness, even though some of the drawings are scarcely more than impressions of the subjects shown, and perhaps knocked off in a few minutes. Still, all that is essential to the study in hand is there, and so each sketch, without pretence at finish, is satisfactorily sufficient. Among these drawings we may note a view of a Courtyard from the Place des Arts, Rouen, with its conical roofs of small slates and half-timbered gables. Another sketch somewhat similar to the last is from the Maison de M. D'Ornery, Boscherville. Some gables from Beauvais, hung close by, are drawn, as it were, in analysis, to show the construction, as well as patterns, of the timber framings. An almost English bit of Domestic work figures from Harfleur, and several of the other frames contain sketches of genuine West of England houses, both stone-built and in half-timber. Mr. A. Needham Wilson, the Soane Medallist for last year, exhibits his drawings made in Provence during his prescribed tour. They are very numerous, and are the best possible evidence of his industry, though, as a rule, his sketches fail in effectiveness, so that in a show of this kind much hard, conscientious labour is liable to be overlooked by the visitor. Nismes and St. Gilles alone afford almost endless material for careful study, and Mr. Wilson's sketch-book was evidently well occupied here as at Arles, Gard, and Tarascon Castle. The ancient cloisters from Vaison, Vaucluse, forming part of the Cathedral there, are shown, and the W. portals of St. Agricol, Avignon, as well as the Chateau des Issacts aux Angles Gard. Roman remains and mosaic enrichments, sculptures, and wood carvings likewise are included in the series. Col. R. W. Edis's prize of twenty guineas attracted three students only, and of their drawings little need be said. "Quod potui perfeci" is the motto of one set which furnishes some elaborated measured sheets from Hampton Court Palace, giving the best part of this historic building, with others of equal character from Trinity College and Magdalen College, Cambridge. "Semper Fidelis" sends a goodly number of sketches, chiefly from Exeter, showing the timbered houses in North-street, and measured drawings of the old Guildhall, and to this set, which is by Mr. Sidney K. Greenslade, the prize has been awarded. In the arbitration room downstairs the competitors for the special Travelling Studentship of £100, offered by the Committee of the British School at Athens and the President of the Institute, displayed their drawings. Most of these are old friends, the best of them having already done duty on former occasions, and some of these have previously been awarded medals and prizes. None appear to indicate any special knowledge of Athenian architecture; but some difficulty has probably been experienced in awarding the prize with such a close competition. West Walton Church, Norfolk, by Mr. A. N. Wilson, is one of the best sets, and, like another of Aberdeen Cathedral, by a Scotch competitor, has been exhibited in these galleries before. The fortunate competitor who has won the studentship is Mr. R. Elsey Smith.

A GOOD WOOD-BLOCK FLOORING.



AT the invitation of the Executive Committee of the Manchester Jubilee Exhibition, Mr. Roger L. Lowe laid his patent wood-block flooring at the principal entrance, covering about 1,800 superficial square feet with pitchpine blocks. The traffic on this floor has been enormous, it being estimated that in and out over 7,000,000 people have passed over it. After careful examination, the flooring is little the worse, not one single block being loose or damaged in any way. Where the stream of people passed through the doorways, and the traffic was of necessity narrowed to a few feet wide, the wear has been the greatest, but even here it is very slight indeed. Knowing that the main buildings were to be sold, Mr. Lowe wrote to the executive committee respecting his flooring, and received the following reply:—

"I am instructed to inform you that the whole of the Exhibition Buildings are to be sold by auction next week, and will immediately thereafter be pulled down.

"The committee will, therefore, feel obliged by your taking up and removing your flooring during the course of the present week. I may add that the flooring has stood the enormous traffic at the entrance to the entire satisfaction of the committee.—I am, yours faithfully, A. A. Gillies, sec.

AMALGAMATION OF THE BATH-STONE QUARRYMEN.

THE great Bath-stone quarrymen of the West of England have amalgamated their several Bath-stone businesses into one, and that after this date they will be carried on as one concern under the style of "The Bath Stone Firms, Limited." They are not taking this step for the purpose of disposing of the whole or any portion of their interest. On the contrary, the entire capital of the united business will be provided solely by themselves. The numerous buildings—Ecclesiastical and Domestic—which were erected in Bath stone many years ago, and which are to-day in excellent condition, prove

that when the stone is chosen with judgment, and used with reasonable care, it is thoroughly reliable, and that there is no other building material that is at once so trustworthy, so effective, and so economical. That Bath stone is as good to-day as it ever was, is an undeniable fact, which is evidenced by many buildings that have been erected in this stone in recent years. The interest of the amalgamated firms will be not to recommend any particular description of Bath stone; but, possessing all the varieties, to insure that the preferences of architects for certain kinds are carefully observed. There is no intention of raising the price of the stone, and the conduct of the business will remain in their own hands, the details of management being carried out by the most experienced and practical men in the trade, who are also large proprietors. The firms concerned are Messrs. Pictor and Sons; Randell, Saunders, and Co. (Limited), Isaac Sumsion, Corsham Bath Stone Co. (Limited), R. J. Marsh and Co. (Limited), S. R. Noble, and Stone Brothers (Limited).

METROPOLITAN BOARD OF WORKS.

THE Works Committee reported to the Metropolitan Board on Friday that they had investigated the charges against Mr. Hebb, their assistant architect, of demanding boxes and stalls from the managers of theatres, and they recommended that he should be called upon to resign. A letter was read from Mr. Hebb, submitting that the course proposed went far beyond what the justice of the case required, as it would blast his reputation and bring upon him professional repudiation. After a heated discussion, Mr. Hebb was called before the Board, and asked that he might have time to prepare his defence and call witnesses, as he should then be able to emphatically disprove the charges brought against him. It was agreed to accede to this, and to adjourn the matter until the second week after the Christmas holidays.—With reference to the decease of Mr. E. Woodthorpe, late district surveyor for the District of the Northern Division of the City of London, and the District of Limehouse, Wapping, the Precinct of St. Katherine, and the Hamlet of Ratcliff, it was decided that a district surveyor be appointed for each of the two districts; that advertisements be issued inviting candidates for the appointments, and that the Board do proceed to the elections on Friday, the 13th January, 1888.

THE CHAIR OF QUEEN HATASU.

WE illustrate to-day what is probably the most venerable piece of furniture in the world—viz., a "Royal Egyptian throne, of the above-named queen, Hatasu, a lady who lived and reigned in the Nile Valley some 1,600 years before Christ and 29 years before Moses." The throne, or rather the remains of it—as what is left is in a dilapidated condition, and has to be secured with brass bands—is made of what appears to be lignum-vitæ, is of a dark colour, like the cocus-wood, and is inlaid over all the carved portions with gold plates. The two sacred serpents, shown on the two uprights at the back, however, are not treated so, but, as our detail illustrates, with little silver rings sunk all over them—probably a conventional rendering of snake-skin. This interesting throne-chair is in the upper gallery of the Egyptian Court, and has just been presented to the British Museum by a gentleman in Cheshire.

Receiving orders are announced to have been issued in the cases of the following builders:—Blamey and George, Stukeley-park, Fulham; John Dart, Morice Town, Plymouth; Thomas Grey, Penarth; and William Gilbert Wyatt, High-street, South Norwood.

The first stone of the Queen Victoria Jubilee Board Schools, Dewsbury, was laid on Friday. The site is situated between Wellington-road and Westgate. The architect is Mr. John Lane Fox, of Dewsbury; and the contractors are Messrs. E. Chadwick and Sons, of Staincliffe, who are erecting the town hall in Dewsbury Market-place for the Corporation.

A full-length painting of ex-Lord Provost M'Onie was unveiled on the 15th inst., in the Corporation Galleries, Sauchiehall-street, Glasgow, by Lord Provost Sir James King, and a replica was presented to Mrs. M'Onie. Mr. Geo. Reid, R.S.A., is the artist.

WAYSIDE NOTES.

I DO not know what may be the ultimate result of the inquiry at the Metropolitan Board of Works into the charges brought by Mr. Augustus Harris and Mr. Hare against Mr. Hebb; but surely some notice of the matter is to be taken elsewhere. Mr. Hebb is a Fellow of the Institute, and although that body has been remarkably shy in the past in moving where the interests and honour of its members have been concerned, it surely cannot let this matter drop? If Mr. Hebb is the victim of scandal, he ought to be able to claim the fullest assistance of the Institute in establishing his reputation. If the charges brought against Mr. Hebb should turn out to be true, I imagine it will be the duty of the Institute to take steps of a very different nature—if architects who do not cadge for theatre orders are still to remain Mr. Hebb's fellow members. But I still cling to the belief that the charges cannot be true, and that the Royal Institute of British Architects will do its duty, and by an independent investigation establish Mr. Hebb's innocence.

There was evidently a very strong party spirit among the assembled members and visitors at the last meeting of the Architectural Association, which, although it did not rise to such a pitch as that on the memorable occasion when Mr. Cole A. Adams brought in his motion to raise the annual subscription, was yet running very high, as one could tell by the nature of the applause of the Registrationists and that of the gentlemen who may be said to have occupied the Opposition benches.

It was with intense interest that I listened to Mr. T. Graham Jackson's opening remarks on "The Proposal to make Architecture a Close Profession by Imposing the Test of Examination and Registration." One naturally felt curious to know the exact views, on the topic of the hour, of an able architect who has held aloof alike from Institute, Association, and Society. Those, however, who, like myself, were a little uncertain as to the position the lecturer would assume with regard to Registration were not long kept in suspense; for Mr. Jackson had not proceeded very far with his discourse before it became painfully evident that he had determined to make out the best case possible for the "Opposition," and to exhibit to his audience the darkest side of the Registration scheme. But, unfortunately for his cause, he rather overstated his case, and, metaphorically, trod upon the toes of his friends in the matter of examinations generally, and that of the Institute in particular, intimating that such tests were of little or no use in determining the capability of a student to design a work of architecture.

This was rather an unfortunate point in Mr. Jackson's paper. It weakened the Anti-Registration party, as it split it into two divisions—one composed of those who would oppose the Bill "tooth and nail," and the other of persons who would believe in the efficacy of examinations; and it caused Mr. Arthur Cates to pose as the champion of the Institute exam., which he ably defended, and, moreover, gave the assembly an outline of a scheme he has for some time been engaged upon, for dividing the examination into three sections—preliminary, intermediate, and final—a measure that must be of inestimable advantage to the profession. I should say that Mr. Cates' defence of the Institute exam. negatived the antagonistic arguments; and as regards Mr. Jackson's other objections to the Bill, I feel bound to say I could not see a single one that could not have been answered by an eloquent, enthusiastic Registrationist. Unfortunately, the oratory was all on the other side. I trust Mr. Jackson will forgive my saying that many things he put forward as objections were, in reality, most unpractical; or, at any rate, of such description as would be little regarded by a workaday world. It does not appear to me that his paper in any way injured the cause of the "Architects', Engineers', and Surveyors' Registration Bill."

Mr. Jackson, someone said, had done wrong in bringing the question of Registration before the members of the A.A.; but, as the next speaker pointed out, if the question affects

anyone, it surely affects them! Being mostly composed of young men who have their way to make in the world, it is of great moment to them to decide whether they will be better able to struggle into practice as registered architects—with a hall-mark that the public will recognise—or in the same way as their predecessors—competing with brazen-faced incompetence. Let the younger members of the Association look to this. One speaker on Friday last said he had hoped to hear the opinions of students that evening. It *would* have been interesting, but they did not get a chance.

In the matter of the Indianapolis Competition. As Mr. Editor observed last week, the time for sending in drawings for the Soldiers' and Sailors' Monument at the above American city is now drawing near But we have some marvellous draughtsmen in our midst, so it is possible there will be many an exhibit prepared in this country, even by those who only awoke to the existence of the competition with the appearance of the advertisement in last week's issue. Who cannot "spin a yarn" about hair-breadth escapes in competition work? Often have I heard young competitors relate with pride how they have prepared a set of competition drawings in no time, or something less! They belong to the "wholesale" class with a vengeance! More haste less speed, my young friends—especially in competition work. Once upon a time we ourselves essayed to beat the record in the matter of quick drawing. Alas! we got no job, and no premium; *but* a contemporary, in reviewing the competitors' exhibits, observed that "of some of the drawings it would be unkind to speak."

There was a communication about the Indianapolis competition in the *American Architect* of the 12th ult. It was headed, "Bulletin No. 3," and appears to be a circular issued by the Commission, that is not to be found in the particulars that I obtained last week for curiosity's sake. There are only two "bulletins" contained therein. The one that appears in the *American Architect* is dated "Indianapolis, Nov. 1." It replies to a few questions by architects who proposed competing; but the replies are not of much moment, excepting, perhaps, the one which states that the ten architects who have been especially invited to compete will have no advantage whatever over uninvited competitors. As far as I can judge from a hasty glance at the particulars issued, the architects of America receive more respect from competition inaugurators than do we in "merrie olde England."

I see that the inhabitants of Walworth met last Tuesday to support a movement in favour of adopting the Free Libraries Act. The motion of the chairman that the assembled persons should pledge themselves to support the proposal was carried with only two dissentients. This is better than the result of the meeting at Scarborough, where the Yorkshire folk refused, point blank, to adopt the Act. The Queen of Northern watering-places has, it is said, disappointed us in the matter of her club competition; and now the town proves a black sheep (from an architect's point of view) in the question of free libraries. Nevertheless, their cause gathers strength as time goes on. Doncaster has offered liberal premiums for designs for a library; and, according to Mr. "Chips," the one at Denton is now well in hand. Last week, I happened to pass the Tate library in the South Lambeth-road, but the walls of this building were then barely above the level of the ground.

Don't forget to inquire into the most desirable form for arranging the internal economy of free libraries. *Verb. sap.*

This week's "B. N." will, doubtless, be perused more at leisure than is ordinarily possible to the busy architect. Christmas holidays allow one breathing-time towards the close of this eventful year of Jubilee. How many an architect must feel thankful for the J——e! There must be a great number of practition ers who, had not our gracious Sovereign Queen Victoria accomplished the fiftieth year of her reign, would have been complaining of bad business, whereas now they have been "up to their eyes" in work in connection with Jubilee clock-towers, halls, institutions both public and private, and what not. Perhaps, if they have not erected any new buildings, they have partially pulled down old ones, and may feel proud (?) that they have desecrated many a venerable, weather-beaten village church and many an old, ivy-mantled tower, and that they have dislodged some tons of old stonework and obliterated an acre or so of mouldering carvings. Hurrah for the Jubilee! By how much are we poorer now in the matter of old work than before the commencement of Anno Domini 1887? Pardon me, O reader, it is only, as you say, pure jealousy—no restoration job having come in the way of him who now heartily wishes you "A Merry Christmas and a Happy (and Prosperous) New Year"—the ancient

Goth.

CHIPS.

An agitation has been going on for some time past among the quarrymen of Easdale, Argyleshire, on the Marquis of Breadalbane's estate, the causes being dissatisfaction with the manager of the Slate Company who lease the quarries, and with the present low rate of wages.

The death of Mr. Charles Langton, of Langton Hall, has been commemorated by the erection of a "Latten" brass, worked by Mr. Gawthorp, of Long acre, London, and placed on the south wall of the chancel of Langton Church, below the Langton escutcheon.

At Evesham on Thursday, the 15th inst., the clock tower erected by the burgesses to commemorate the Jubilee was inaugurated. The turret is situated on the end of the Town Hall facing High-street, and is of oak, resting upon a square tiled base. It consists of three tiers, the lowest containing a four-dial clock, with gasfittings for illumination at night, and the next a bell weighing 4cwt. for striking the hours. The cost of the turret was £450. A vane, a wind gauge, barometer, and thermometer, the three latter being inclosed with massive plate-glass in bronze frames in the middle pier looking towards High-street, have been presented at an expense of about £100. The clock itself, which cost about £150, was inserted by the Corporation.

Tapeley Park, near Bideford, the Devonshire seat of Mr. W. L. Christie, is being restored by Mr. Ewan Christian. The old house has been re-roofed, and part of the outer walls pulled down and rebuilt. The outer parapet has been removed, and the roof carried over walls, with good eaves. The fronts of the house have been cased with red facing brick, and the west front rebuilt with a new bay to drawing-room. The work has been intrusted to Mr. Wm. Dart, of Crediton.

On Wednesday week a private chapel in Benwell Tower, the Bishop of Newcastle's house, was dedicated. The chapel is of stone in the Tudor style. An open screen with folding gates separates the chapel from the ante-chapel. The reredos of carved wood is the gift of the ladies of the diocese. Amongst other special gifts is a pastoral staff of oak.

The prizes and certificates gained by the successful students at the colleges connected with the City and Guilds of London Institute for the Advancement of Technical Education were distributed on Friday night by Sir John Lubbock, M.P., at the Carpenters' Hall, London Wall. Sir Frederick Bramwell presided. The reports on the Central Institution at South Kensington, the Finsbury College, and the South London School, read by the hon. secretary, Mr. W. P. Sawyer, were of a highly satisfactory character. Sir John Lubbock, in his address, remarked that the Guilds Institute was not only vigorous, but continued to grow by leaps and bounds. The number of candidates in 1883 was 3,635; in 1884, 3,968; in 1885, 4,764; in 1886, 6,508, with 8,600 students, while this year the number of students was 10,284, and there were 460 classes.

A cross, subscribed for by students past and present of the Scholæ Cancellarii, Lincoln, has been dedicated at Lincoln Minster. The cross is of copper gilt, with crystals, and it stands 5ft. high. It was designed by Messrs. Bodley and Garner, and cost £95.

A new Free Presbyterian church is about to be built in Fasnefern-road, Fort William, N.B. Mr. Sydney Mitchell, of Edinburgh, is the architect.

The interior of the nave and aisles of the parish church of Holy Cross, Crediton, is now undergoing restoration from designs of Messrs. Hayward and Son, architects, Exeter. The high pews have been taken out, and will be replaced by open oaken benches, with richly carved, traceried ends. The floors will be of solid oak blocks, with tiled aisles. The pulpit is to be executed in Mansfield stone. The contractor is Mr. Wm. Dart, of Crediton.

Building Intelligence.

Bedford.—The new Provident Dispensary, built on the site of an older one on St. Peter's Green, was opened by the Marquis of Tavistock on Tuesday week. Messrs. Usher and Anthony, of Bedford, are the architects, and the style is that of the 16th century. The principal front is faced with Lum's Hill stone from Derbyshire, rocked faced, in random courses, with dressings to all doors and windows in Sumsion's Monk's Park Bath stone, and stringcourses, cornices, and copings with Ketton stone. The roof is covered with Broseley tiles, and the ridge with Cooper's crested ridge tiles. The waiting-room is 35ft. by 29ft. and 15ft. in height, lighted by a large mullioned window and smaller lights filled in with stained glass. The floor is of solid wood blocks, laid by the inventors, Messrs. M. C. Duffy and Co., London. This hall is heated by one of Messrs. Musgrave's slow-combustion ventilating stoves; the stove is backed by a Hopton Wood stone chimneypiece with embossed tiles. On the south side of this hall are the consulting-room and the dispenser's-room. The general contract was taken by Mr. J. P. White, of Hassett-street.

Bradford.—The School Board have adopted plans by Mr. C. H. Hargreaves, of Bank-street, Bradford, for their new offices to be erected on the site of the present Salem Chapel in Manor-row (the new chapel which is being built at Manningham to replace this building, from plans by Mr. J. Ledingham, was illustrated by us last week). The building will be three stories in height, with a basement extending over three-fourths of the area. The Manor-row façade, however, will, in the central portion, present the appearance of being only two stories high, the extra height being given to the board-room. In style the building will be of the English Renaissance, with detail of an Elizabethan character. The basement will be rusticated with large square-headed windows. The principal entrance, which will project slightly from the main front, will be flanked with columns of the Roman Doric order. This entrance leads to a vestibule 11ft. in width, beyond which is a corridor 9ft. wide, passing round three sides of the building, and giving access to the various offices. Adjoining the attendance-officers' rooms will be a waiting-room. There will be two committee-rooms, a waiting-room, rooms for school superintendents and assistants, and a second waiting-room for visitors, all the outdoor officers being accommodated on the ground floor. A wide staircase leads to the first floor, on which will be board-room, general office, committee-room, waiting-room, and strong-room. The board-room will be 60ft. by 30ft.; the general clerks' office will measure 40ft. by 22ft. On the top floor are five junior teachers' class-rooms. The cost of the building is estimated to be £18,500; but if the whole of the floors are made fireproof, an additional cost of £1,200 will be incurred.

Carlisle.—The foundation stone of the new public markets, now being built at a cost of £30,000, was laid by the Mayor on Tuesday. The external walls are of red stone from the quarries at Annan, Newbiggin, and Wetheral. The glazed bricks for lining inside are supplied by Messrs. Craig, Kilmarnock; the concrete flooring by Mr. Onerod, Carlisle; the fireproof flooring by Messrs. Lindsay, London; the iron roofing by Messrs. Robertson, of Workington; the builders' work by Messrs. H. and R. H. Hodgson, of Workington; and carpenter and joiners' work by Messrs. W. H. Davidson, Carlisle. The architects are Messrs. Causton and Graham, 9, Spring-gardens, Charing-cross, London; Messrs. Hodgson, of Workington, are the general contractors; and Mr. H. Creswell Charlton is the clerk of works. The style of work is rock-faced ashlar up to plinth; quoins, cornices, and window jambs tooled; and the general walling is random-snecked rubble. The style is Composite. There are six principal entrances, and an arcade entrance from the principal street. A Jubilee tower, 160ft. high, has been built at the north-west corner.

Darenth.—At the meeting on Saturday of the Metropolitan Asylums Board, the Small-pox Hospitals Committee reported with reference to proposed provision for convalescing smallpox patients. The committee had caused

plans to be prepared for a "brick hut" hospital for 600 convalescing smallpox patients, with administrative buildings capable of serving 1,000 patients, to be built on a plateau site at Gore Farm, Darenth, and now submitted these plans for adoption by the managers. The estimate of cost, including the expense of buildings, drainage, &c., gave the total sum as £58,900. The present plans, although providing for the same number of patients as others previously considered, were estimated to cost but little more than half the amount then contemplated. A comparison between the cost of brick and wood structures showed that the saving effected by the substitution of wood for brick in the walls was more than counterbalanced by the space wasted in roofs, and by the cost of the necessary covered ways connecting day and night accommodation, and by the extra cost of duplicating both roofs and foundations. After a discussion the plans submitted were adopted and transmitted to the Local Government Board for approval, and as soon as this approval has been received tenders for erection will be invited by advertisement.

Greenwich.—On the 8th inst. the West Greenwich Ragged School and Working Lads' Institute in Bridge-street was opened. The building consists of a reading and refreshment room, 23ft. by 21ft.; a kitchen, with kitchener and tea-boiler; a gymnasium, 32ft. by 21ft.; an infants' room, 24ft. by 21ft., with gallery, all on the ground floor. A fireproof staircase leads up from hall to a teachers' room, on mezzanine floor, and to the first floor, containing a schoolroom, 56ft. by 21ft. 6in., with a platform at one end, and an open-timbered boarded ceiling, a retiring room, and two large classrooms. The second floor consists of two large rooms, which may be used as dormitories for boys, and the caretaker's apartments. The school is heated by low-pressure hot-water pipes. The total cost, inclusive of lighting, heating, &c., is about £2,000. The architect is Mr. George Baines, 4, Great Winchester-street, E.C., and the contractor Mr. H. L. Holloway, of Deptford.

Leeds.—Premises are about to be built next, and in harmony with, the Mechanics' Institution for the School of Science, and in connection with the Boys' Modern School. The elevations will be carried out in brick, the main fronts being relieved with stringcourses and mouldings of dressed stone. In the rear will stand a tower, containing a combination of flues in connection with the heating and ventilating of the whole of the premises. The contract for the buildings, which, with the fittings, will cost between £5,000 and £6,000, has been let to Messrs. Wood and Son, Churwell; and the work will be carried out under the superintendence of the architect, Mr. C. S. Nelson, Park-row, Leeds, whose designs were selected in a public competition. The accommodation will consist of a chemical lecture theatre for 200 students, a physical lecture room for fifty, a laboratory for seventy, and a number of class-rooms to accommodate 300 students. Master's rooms, store-rooms, and preparation rooms will also be provided. The basement will at present be used as a covered playground, but will be converted into workshops should necessity arise, and the rooms set at liberty in the old building will be available for joiners' shops and other mechanical trades. The old and new school buildings will be connected by a covered bridge.

Liverpool Master Builders' Association.—The annual dinner of this Association was held on Wednesday week at the Adelphi Hotel. Mr. Charles W. Green (president) occupied the chair, and he was supported by the Mayor of Bootle (Alderman J. Howard), Messrs. E. Kirby, H. B. Bare, F. W. Hornblower, W. W. Thomas, Thomas Cook, T. C. Thorburn, E. Hughes, J. H. Kenion, S. H. Holme, Thomas Shelmerdine, jun., J. E. Beauland (Bradford), R. Dennett (Nottingham), J. H. Marsden (Bolton), F. W. Briscoe (Bolton), W. Huntington (Lancaster), C. B. Holmes (Wigan), A. H. Holme, H. A. Matear, George Holme, G. B. Watts, N. R. Stirling, T. Wainwright, J. Wainwright, J. Wannop, G. G. Holme, W. Tomkinson, C. Tomkinson, J. Pendleton, W. Knox, secretary, and the presidents and vice-presidents of the Builders' Association of St. Helens, Wigan, Warrington, Bolton, Southport, &c. Mr. Thomas Cook proposed "The National Association of Master Builders," which was acknowledged by Mr. J. C. White. Mr. J. H. Kenion gave the toast of "The Liverpool Master Builders' Association." The toast was acknowledged by Mr. N. R. Stirling, who said that the objects for which the association was established some 21 years ago had been thoroughly carried out. Mr. S. H. Holme (first president of the Association) proposed the toast of "Architects, Surveyors, and Civil Engineers," which was responded to by Mr. E. Kirby. The toast of "The Iron Trades and Kindred Associations" was given by Mr. E. Hughes, and acknowledged by Mr. Pendleton.

COMPETITIONS.

Edinburgh.—The committee charged with the erection of a memorial to the late Sir George Harrison decided some time ago that the form it should take should be an ornamental gateway or archway over the approach to Blackford Hill, which the late member for South Edinburgh, when Lord Provost, was instrumental in securing as a recreation-ground for the city. Out of a number of competitive designs that by Mr. Sydney Mitchell, of Edinburgh, has just been accepted, and estimates will be taken for the erection of the memorial. One of the features of the gateway will be a bronze medallion, on which will be sculptured in high relief a colossal bust portrait of Sir George Harrison. This part of the work has been intrusted to Mr. Charles M'Bride, sculptor, whose marble bust of Sir George now adorns the Council Chambers.

East Grinstead Jubilee Memorial Committee.—The secretary writes us:—"Notwithstanding your somewhat severe criticism of our proposal, we have received twelve sets of plans—many of them of great merit—in response to the offer of £5 5s." Anyone curious to see the productions of the dozen architects eager to earn five guineas could have done so this week. The fortunate winner is to be selected by ballot of the subscribers!

Gloucester Baths Competition.—The corporation called in Mr. T. Roger Smith, F.R.I.B.A., to advise upon the sixty plans received in the above competition, and, under his advice, have awarded the first premium of £50 to Mr. J. Fletcher Trew, M.S.A., architect, Gloucester, for the set of plans under motto "£5,680," and the second premium of £25 to T. Mr. T. Cook, architect, Victoria-street, Manchester, for the set of plans under motto "£6,000." It is proposed to exhibit all the plans in the Corn Exchange, Gloucester, on Tuesday and Wednesday, the 3rd and 4th of next month. Mr. Fletcher Trew's selected plan, which we shall illustrate in an early issue, provides for first and second-class swimming-baths, with Turkish baths arranged between them, the front portion of site being reserved for private baths, entrances, offices, and superintendent's residence, and also for future extensions. Separate entrances are provided for each sex, and by locking the door leading from male department to Turkish and swimming-baths they are rendered accessible for females on special days without interfering with the usual entrance for males. The dimensions are—first-class swimming bath, 88ft. by 28ft., with the possibility of lengthening to 136ft., and a depth varying from 6ft. to 3ft. Second class, 64ft. by 28ft., and a depth ranging from 6ft. to 2ft. 6in. The first-class private baths for both sexes are arranged on the first floor, and the second class private baths on ground floor. They are of uniform size, 9ft. 6in. by 6ft. 6in. Each section of baths is provided with lavatory, w.c.'s, urinals, and a shower bath. The materials proposed for use are brick, with terracotta and freestone dressings, and, for ceilings, concrete. The construction will be fireproof, finished in tiles and cement.

Northampton.—The competition for the extension of the town hall and municipal buildings at Northampton, built from the designs of the late Mr. E. W. Godwin, F.S.A., has just been decided. The invitation to compete was issued by the town council to all architects practising in Northampton, and to those born and brought up in the town but practising elsewhere. Mr. Charles Barry, F.S.A., F.R.I.B.A., was asked to report and advise on the ten designs sent in under motto, and placed the first three in the following order:—1st, "Civis," by Mr. Edmund Law, F.R.I.B.A., Abington-street, Northampton; 2nd, "Victorus," by Mr. H. Holding, A.R.I.B.A., Market-square, Northampton; 3rd, "St. Crispin," by Mr. A. W. Jeffery, of Hastings. This report has been adopted by the town council. Allusion was made to the fact that, notwithstanding a clause of the conditions stated that "canvassing or solicitation of any member of the council, directly or indirectly, is most strictly prohibited; and any competitor who shall allow his name, or motto, or mark to be divulged, so as to identify the designs, will be excluded from the competition," photographs had been issued of the designs placed second, and one of these had been sent by Mr. Holding to a councillor. A letter was read from Mr. Holding stating that he had forgotten the gentleman in question was a member of the council, and that he had sent it to him as a friend. After a discussion as to whether "Victorus" had not disqualified himself, it was decided by a majority of the council to allow his plan to be included, and eventually Messrs. Law and Holding were appointed joint architects, on the understanding that Mr. Godwin's present front should be continued in the extension. Mr. Barry's fee of fifty guineas and expenses were also voted him.

Perth Station Hotel.—At a meeting of the committee at Perth on Saturday, it was agreed to accept the design sent in by Mr. A. Heiton, Perth, subject to certain conditions. The hotel, which will be built on the Caledonian-road, will have a connection with the station under cover. The cost is estimated at £12,000.

CHIPS.

William Mittens, cabinet manufacturer, of Hoxton-square, was charged at the Worship-street Police-court on Friday with an offence under the bankruptcy laws, by improperly making away with a quantity of timber, veneer, &c., which he had obtained on credit from Mr. John Cameron, a timber dealer. He was committed for trial at the Central Criminal Court.

A new organ in St. Bede's Church, Sunderland-road, Gateshead, was opened on Tuesday in the presence of the Bishop of Durham. It has been built by Messrs. Harrison, of Durham, at a cost of £360.

A feuing plan has been prepared by Messrs. Kinnear and Peddie, architects, Edinburgh, of an area of 15 acres at Craiglockhart which was acquired a number of years ago from the City Parochial Board. The ground is situated between the Craiglockhart Hydropathic and the Union Canal. It is intended to lay out the ground for villas, in lots of from a quarter acre to an acre and upwards, and also to erect, adjoining the canal, a continuous line of smaller houses, with front gardens and back grounds.

A new church is about to be built at Nantymoel, near Bridgend, from plans by Mr. E. M. Bruce-Vaughan, of Cardiff.

Last week the Philharmonic Music Hall, Cardiff, was reopened, after having undergone complete alteration and renovation. About seven weeks ago the building was closed, and the work, which was then begun, was kept going practically day and night until the opening. Every particle of the inside was swept away, and a new proscenium, boxes, balcony, and promenade erected. The alterations were carried out by Mr. J. E. Jackson, builder, Cardiff, from plans and under the superintendence of Messrs. James and Morgan, architects, Queen-street, Cardiff. The decorations were executed by Messrs. Geo. Jackson and Sons, and the linerusta work by Messrs. Fredk. Walton and Co. Entire new scenery has been set by Mr. H. Churchward—all of London.

The brother officers of the late Lieut. R. A. Theodore Dury, of the 2nd Battalion South Wales Borderers, have just placed a mural brass cross to his memory in the nave of Rochester Cathedral.

A new bridge which spans the river Tweed at Norham, and which has cost about £10,000, was opened on the 15th inst. It consists of four arches of stone, and is after the Norman style. The outside arches on the Scottish and English sides of the river respectively have a span of 85ft., with a rise of 18ft.; while the centre arches have each a span of 90ft., with a 20ft. rise. The height of the bridge from summer water level to the crown of the highest arch is 38ft. It is 400ft. long and 16ft. broad. The engineers were Mr. Codrington, C.E., and Mr. Brereton, C.E.; and the contractors, Messrs. Meekan and Deans.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Association of Science and Arts.—At the second meeting of this Association for the season, held on Dec. 19th, a paper on "The Foot Trapping of Soil Pipes" was read by Mr. W. P. Buchan, Glasgow. Mr. Buchan said that, more fully expressed, his subject was, "Is it better and safer for the inmates of a house that, when it can be done, the soil pipes should be trapped off outside from the drain, or that the soil pipes should be used to ventilate the drain?" Having referred to the old-fashioned trap with the eye in the centre, he said many hundreds of these traps had been taken out of late in Glasgow and all over the kingdom, and others substituted. In 1875 and 1877 he brought out traps which, in addition to the benefit of the cascade, allowed the house side of the trap to be fully seen. These had been used not only in this country, but in America. Various attempts had been made to improve on his trap, but he did not think the alterations were improvements. In the case of tenement houses, so many of which had a soil-pipe coming up the middle of the building, it was difficult to do otherwise than allow the soil pipe to ventilate the drain. In the case of villas and mansions inhabited by the owners it was, however, different. He asserted that the sectional system was the safest and best. All the branch pipes coming into the main drain should be trapped off from the main drain, so that no foul air could get up any of the soil or rain pipes. Some people, however, said that it was wrong to prevent the foul air of the drain going up the soil pipes; they said the more ventilation they could give the drain, the better. The engineer, however, should not so much look after the drain as after the people. A drain might be sufficiently ventilated by one pipe, and no more needed two or more blow-off pipes than a fire required several chimneys. Without traps, disease germs might be carried from one soil pipe to another, and thus to the people in the rooms. Sanitary appliances should be fitted up in such a way that as little harm as possible would result should anything go wrong. The reverse had been the case for many years. The discussion which followed was principally favourable to Mr. Buchan's views.

Sheffield Society of Architects and Surveyors.—The second meeting of the present session was held at the School of Art on Tuesday week, when an address was given by Mr. J. W. Connon, F.R.I.B.A., of Leeds, on "The Legal Registration of Architects." Mr. T. J. Flockton, president, occupied the chair. Mr. Connon advocated the legal registration of architects on the basis of the existing registration of the legal and medical professions. He showed its advantage (1) to the student, (2) to the architect in practice, and (3) to the public. He urged the desirability of union amongst architects in pressing this question forward for the consideration of Parliament. A discussion ensued, in which Messrs. C. Hadfield, C. J. Innocent, E. Holmes, W. C. Fenton, E. M. Gibbs, and W. F. Hemsoll took part. Eventually, on the motion of Mr. Innocent, seconded by Mr. Hadfield, a hearty vote of thanks was accorded to Mr. Connon for his address.

The tenders for the construction of the new Pier at St. Leonard's has been signed, and the work of building commenced. The tender of the successful contractors is £15,139; and a further sum of £4,500 will be set apart for the erection of a pavilion, kiosque, and wind shelters.

The bronze statue of the Duke of Buccleuch by Mr. Boehm, R.A., London, was set up on its pedestal in West Parliament-square, Edinburgh, on Friday, and will be unveiled shortly.

Extensive alterations are being carried on at the Friars carpet works, Bridgnorth, including winding-room, starching-room, drying stoves, engine-room, and boilers. The work is being carried out by Mr. W. Bate, builder, of Bridgnorth; and Mr. J. T. Meredith, of Kidderminster, being the architect. The cost of the alterations will exceed £3,000.

The Church of St. George, Oldham-road, Manchester, erected ten years ago, has just been completed by the erection of a belfry stage and stone spire, at an expense of about £2,000. The completion of the work was marked on Friday by a dedication sermon by Bishop Cramer Roberts.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., and XII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—F. G. U.—W. B. S. and Son.—W. T.—R. L. L.—Rev. F. G.—A. and Co.—E. H. W.—T. B. and Co.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Arry," "Pecksniff," "Herani," "W. H. L." in circle.

ANXIOUS ONE. (The selected designs and review will appear next week.)—GEORGE STREET. (Black Indian ink is better than Prout's brown, as the lines are finer.)

Correspondence.

EXAMINATIONS IN ARCHITECTURAL ÆSTHETICS.

To the Editor of the Building News.

Sir,—Mr. T. Graham Jackson, in the interesting paper that he read before the Architectural Association last Friday evening, asserted that it was not possible to ascertain the depth of an architect's knowledge of, or the extent of his power to produce, the beautiful in architecture, by any test imposed by examination.

With respect to *style*, doubtless Mr. Jackson's view is correct, and most persons will hold a similar opinion. But can this be said with regard to *principles?* Are there not certain laws of architectural design which, though they be ever so neglected, are yet at the basis of all true material beauty, and will so remain to the end of time?

It will be found that it is upon matters of style that we disagree; not upon those of principle. There are questions in design upon which all agree: they are those of principle. There are points upon which all differ: they are those of style. Style is the outcome of inborn taste, association, use, and circumstance. Principle is the firm-set rock to which we may safely anchor, and bid defiance to the storms of fashion.

You, Sir, in your columns, have often urged the necessity for a deeper study of first principles of design; and you have pointed out the vanity of all attempts to produce noble and living works of architecture by mere study of style and the acquirement of an extensive knowledge of forms and features. May I add that there would seem to be a solution—partial, at any rate—of the difficulty of Mr. Jackson, in the institution of a system of examination that would ignore questions of style, and deal solely with those questions of first principles which, as you have said, underlie all styles of design?

Surely these principles are neither so abstract and recondite, nor so indeterminable and indefinable that they could not be grasped by the least intelligent of students. And surely *they* would form the proper subject-manner for questions at examinations, of which a student could give as certain proofs of having mastered as a schoolboy could of having learnt his *Pons Asinorum*. It would appear to me that in the institution of an examination on first principles of architectural æsthetics, we should find a solution of the problem of art-examinations, since no one will essay to question the soundness of those principles and unalterable laws that constitute the *science of the art* of architectural design.—I am, &c.,

R. Owen Allsop.

THE DRAUGHTSMEN'S PROVIDENT SOCIETY.

Sir,—Will you allow me to point out to architectural draughtsmen and draughtsmen of kindred professions that the above society has now been formed and is already in full working order? And perhaps you will permit me at the same time to briefly sketch out some of the society's aims and objects.

Its objects, then, are the payment of a weekly monetary allowance during illness or disablement, the lending of small sums to members who are in distress, and the payment of a sum on the death of a member.

The qualifications necessary for entrance to the society are that the candidate for admission must state in what profession he is a draughtsman, and furnish a medical certificate of good health to be submitted to the committee for acceptance. There is, it goes without saying, a reasonable limit as to age.

Every member will be at liberty to contribute for payment during illness of not less than one guinea per week, according to the secretary's tables. He will also be able to join the Loan Fund provided he is a member of one of the other two funds before mentioned at the small quarterly payment of one shilling, which will enable him to borrow a substantial sum of money to tide him over difficulties when out of employment. These loans will be made free of interest.

The foregoing are some of the advantages which can be secured by belonging to this society, and it cannot be denied that the want of such an institution has long been apparent, the only wonder being that one was not started before, draughtsmen, up to the founding of this society being about the only class of toilers who had no provident institution of their own. Those who are desirous of joining should do so at once by applying to Mr. Middleton, at St. James's Hall, the first hundred members complying with the stated requirements being admitted free of entrance fee, which will not be the case with those who come later in the day.

A public meeting, I may add, will be held at St. James's Hall on January 9th, 1888, at 7.30 p.m., to consider the rules drawn up by the committee, and to this meeting all draughtsmen who wish to join or to learn more about the society are invited.—I am, &c.,

H. Greenway.

Cavendish-road, Brondesbury, Dec. 20.

SAFE STAIRCASES.

Sir,—I notice in your issue this week you comment on my idea of a staircase.

I do not advocate a "straight-away staircase" except with constant landings and strong handrails on either side of the staircase.

What I did say was that the ellipse was out of the question as a form for a safe staircase for public use; but that it was a question whether the square or straight staircase was really the best. But both these forms were undoubtedly better than the ellipse.—I am, &c.,

Walter Emden.

105 and 106, Strand, London, W.C., Dec. 19.

PERSPECTIVE.

Sir,—Some gentlemen whose sphere is teaching, and whose teaching spheres seemingly require to be taught what a sphere is, as they try to demonstrate, and would have us believe, that a sphere may, and should be, sometimes something else. They remind me of the perverted heraldic painter who would not believe that the beast shown him at the Zoological Gardens was a lion. So these spherical sophists befogged with rule would e'en correct nature when she fails to conform to the scholastic theory; and the mischief of it is, they are miserably misleading others.

Nature before art, say I; truth before theorem. A sphere I declare to be always a sphere, and never to be represented but as a circle. If the rules of perspective show otherwise, then *the rules are wrong*. It needs to be borne in mind that the so-called science of perspective is at best imperfect, and some rules that are taught, known as horizontal perspective, are radically wrong—utter rubbish. In order to approach nature it is necessary that of the lines bounding view do not make an angle of more than 30° to 40°; but even then there will be a modicum of error, as the field of view or plane of picture should really not be, as we make it, a straight line. Each pencil of light should be intersected at a right angle; thus, the pencils impinge upon the retina of the eye. The picture plane ought to be a curve struck from standing point of spectator. However, within the angle named the deviation is not great, but with extended angle comes glaring misrepresentation. This is more particularly seen in horizontal perspective, by which at sides of picture objects are utterly distorted; spheres would thus, no doubt, be out of shape, for all is wrong. But don't let us pretend and teach that this is perspective. We must not lose sight of common sense—the best of sense!

I am surprised that an art teacher should justify the "fudging" of perspectives. Falsehood is as bad in an architectural drawing as in speech. It would show want of rectitude, and, if suspected, utterly destroy the value of the work.—I am, &c., M.

THE AGE OF ELM JOINERY.

Sir,—As my men were engaged the other day restoring the entrance door of Exeter Guildhall, they discovered the date 1593, which had previously been hidden by successive coats of paint.

This, of itself, would not be a remarkable discovery; but, upon closer examination, I found what to all intents and purposes seemed a solid oaken door, was nothing less than an *elm* one—the oak carving being pinned carefully on each face of the door. Undoubtedly, the elm is of the same date, and therefore has endured for nearly 300 years.

We are so constantly told that elm will only last a great age under water, that I venture to ask if any of your readers know of any elm joinery that has lasted over 200 years?

If so, the question arises: Under what conditions must the wood be seasoned to attain lasting properties like unto the old Guildhall door?—I am, &c.,

Crediton, Dec. 18. W. Dart.

"COMBINATION SET-SQUARE."

Sir,—The above has been in use in my office more than ten years.—I am, &c.,

C. J. Innocent.

17, George-street, Sheffield, 19th Dec.

The foundation-stone of the New Grammar School, at Cheltenham, was laid on the 14th inst., with Masonic honours, by the Right Hon. Sir M. Hicks-Beach, M.P. The new buildings will accommodate 300 boys, and the contract amount is £6,250. Messrs. Knight and Chatters are the architect.

Adjudications in bankruptcy have been made in the cases of James Whitaker, Cromwell-gardens, West Kensington, builder; Henry Cochran, Burton-on-Trent, late of Stapenhill, Derbyshire, builder; and William Wright, Ipswich, builder.

M. Edmond About's monument in Père Lachaise Cemetery was unveiled on Tuesday. The sculptor is M. Crank, who has represented About seated in an armchair, dressed in the loose coat which he usually wore indoors.

Intercommunication.

QUESTIONS.

[9506.]—**Hydraulics.**—I shall be glad if some experienced reader will let me know what weight a piece of oak, 2ft. 6in. × 18in. × 4in., will support when placed upon still water 8ft. deep, and to what extent would the weight immerse the block? It would be interesting also to know how the result is arrived at.—Buoyant.

[9507.]—**Vaulting.**—Professor Willis, in his "Essay on the Vaults of the Middle Ages," has this passage (page 25): "The apparent mutual independence of the ribs is increased in the best specimens (of vaulting) by the manner in which they start from the abacus, some being more prominent than others. This is easily managed by placing the feet of the curves at different distances from the centre of the abacus" Will any of our readers kindly tell me if this method of starting the ribs is a purely æsthetic one, or whether it is governed by constructional considerations? It would seem that the plan which the group of mouldings form upon the abacus is arranged entirely to suit the taste—for example, the fillets of the several ribs might all be placed at the same distance from its edge, always provided that the ribs free themselves from each other at the same level, as their curves are set out quite independently of each other, according to their height and the distance they have to travel to reach the ridge. If, however, some ribs are placed upon the abacus more prominently than others for constructional reasons, is there any rule by which their arrangement is determined? I suppose the diagonal ribs, being the longest, would be placed further back than the rest, and so on. Professor Willis says nothing more about this in his Essay, but supposes all vaults to have been set out according to a sectional plan taken at about half their vertical height. Any explanation of the above will greatly oblige.—A. C. W.

[9508.]—**Colour.**—I have observed that upon looking through a piece of deep coloured ruby flashed glass on the blossom of the common scarlet geranium, the latter, instead of appearing to increase in redness, becomes pale, nearly white, and scarcely to be distinguished in colour from a piece of white paper. What is the explanation of this? I have been reading the works of Church and of Benson on "Colour," but these do not solve the matter for me. They say that light transmitted through red glass has the green and blue rays cut off, and that the glass is permeable to the red rays only. If this were so, the redness of the geranium flower should be increased in intensity instead of being nearly blotted out. I have tried the same experiment with other reds—*e.g.*, Japanese lacquered trays, red book-covers; but in these cases the reds are intensified. I may mention that the glass is of the common description used by builders in the narrow margins and corners of staircase window sashes, and that what I meant by flashed glass is that the body of the glass slightly over 1-16in. thick, being colourless, the ruby colour is flashed over on one side only in a very thin film.—W.

[9509.]—**Plugging Wall.**—Will some reader of the "B. N." kindly tell me how to securely plug a wall so that bracket lamps can be safely fastened to them? Several times they have been firmly wedged and the brackets screwed to the wedges, but in time the latter work loose and get shaky and dangerous. — Woodrose.

[9510.]—**Letting Land.**—Will some reader inform me what are the usual charges for letting land on building lease for 99 years? I was the appointed agent and surveyor, but made no arrangement as to any charges. I have prepared most of the plans for the houses built upon it.—R.

[9511.]—**Etching.**—I am anxious to learn etching, and shall be glad if anyone will give me any hints on the matter, either as to books on the subject or as to where the necessary instruments, &c., can be obtained.—Needle.

[9512.]—**Tables of Depreciation, &c.**—I shall be glad if anyone can tell me where I can find any tables on depreciation, sinking fund for leasehold property, and how same is worked out.—Ground Rent.

[9513.]—**Damp-Courses and Concrete over Site.**—I imagine damp-courses are only necessary in damp situations. The Model By-laws generally in force make no distinction, but indiscriminately insist on laying same in all buildings. I should like to know whether this by-law is universally insisted upon, or whether it can be safely ignored where it is not necessary? Is it advisable to comply with the by-law demanding 6in. of concrete over site of building where subsoil is dry, hard, and compact? How could a damp-course be best manufactured on the site from mineral tar?—Confusion.

[9514.]—**Certificated Inspector of Nuisances.**—I am desirous of becoming a certificated inspector of nuisances. With the Public Health Act, 1875, what other books would be best to acquire and study? When is the next examination, how often, and where are they held? An answer from "A Member of San. Institute," or any person who has passed recently, would oblige.—Enlightened.

REPLIES.

[9471.]—**Music Hall.**—I am sorry for the mistake, but it was not mine. I wrote "Vol. 36" in Arabic figures, but a printer's error, by leaving out an X. in translating this into Roman numerals was the cause of the disaster "E. W. H. P." complains of.—A. C. W.

[9486.]—**Earl Strongbow.**—In a recent note upon Strongbow's monument in Christ Church Cathedral, I remarked that I thought it, and the one by its side of the warrior's unfortunate son, to be of polished Purbeck marble. Mr. T. Drew, writing me on this point, says the truncated boy referred to and an interesting effigy of a lady (circa A.D. 1170-80), which I remember seeing in the chapel of St. Lawrence, are the only existing specimens of old Purbeck marble in the Cathedral. The monument attributed to Strongbow is of Irish limestone; but Mr. Drew points to the curious fact that the arms of Fitzosbert occur upon this tomb, making it very doubtful, indeed, whether this is the original monument which it is recorded was "broken by ye falle of yt Rofe and bodye of Christes Church." He believes the original monument was probably Purbeck, as was, so far as he can judge, all the other stone used there in the 12th and 13th century. What the fine oolite is that the present cathedral is built of, and which has stood so well, it would be very interesting to know.—Harry Hems.

[9490.]—**Measurement of Shafts.**—The flue either should not be deducted, or an extra price per rod should be allowed for the labour of forming and lining the flue.—G. H. G.

[9501.]—**Waterproofing Tank.**—In reply, I think there is nothing better than good fine Portland cement for pointing the glazed brickwork if done carefully; but it should have been made watertight in the construction, unless intended to be cemented after building, as the best means of insuring perfection.—Jas. Pulham.

[9501.]—**Waterproofing Tank.**—"B. P. G." would find the bituminous material, "Hygeian rock composition," suitable for pointing, if Portland cement fails.—G. H. G.

[9503.]—**Stock Size.**—"N." must be a very young practitioner to make the proposition he has done in your last number. The scantlings for roofs and floors of various dimensions are computed from data furnished by Tredgold and others. He should follow the practice of architects in days past now: spend some time in a builder's establishment, and become acquainted with the best manner of dividing the logs and planks imported into useful scantlings, and adapt them to the required purpose.—Z.

[9504.]—**Liability for Damage.**—The question is a difficult one to answer without knowing all the facts of the case. How can an old gable have all the weight of the new gable? Under the contract clause quoted by W. Scott, the contractor is liable to the owner if the extra weight of the new building has caused the adjoining lower gable to settle, as the new building, though heavier, is supposed to have been built with due precautions. With regard to the second question, the architect, under the circumstances, would have a right to retain any balance due to the contractor.

LEGAL INTELLIGENCE.

Re Esdaile and Co.—A first dividend of one shilling in the pound has been paid this week in the bankruptcy of Esdaile and Co. The total receipts since the date of the receiving order have been £13,028 4s. 6d., which, after deducting £8,112 12s. 7d. for payments as per trading account, leaves £4,915 11s. 11d. Of this, £2,889 19s. 9d. goes to the creditors, a balance of £350 is carried forward, and the rest goes in fees, law costs, manager's charges, allowances to bankrupts, &c. The debtors' estimate of amount expected to rank for dividend was £38,803 4s. 4d. The assets not yet realised are estimated to produce £1,750. The balances at the bankers were retained by them against the debit balances on the discount accounts of the debtors. The greater part of the stock and all the horses were distrained upon by the landlords and sold by them. The machinery and trade fixtures, owing to certain legal difficulties existing in connection with them, were sold for £500. The furniture at 27, Nicholas-lane, was distrained upon by the landlord and sold by him. Creditors can obtain any further information by inquiry at the office of the trustee, Henry Brown, 7, Westminster Chambers, Victoria-street, Westminster.

Alleged Infringement of Lift Patent.—Ellington v. Clark, Bunnett and Co.—(Chancery Division, Dec. 8, 12, and 19. Before Mr. Justice Kay.)— The plaintiffs were the patentees of an improvement in hydraulic lifts, such as are used in warehouses, hotels, and other large buildings. The great feature of the plaintiff's invention was that it economised the water. It was alleged that before the plaintiffs' invention the whole or nearly the whole of the water which was used each time the lift was raised was allowed to go to waste. The plaintiffs conceived the idea of so constructing the lift that only that portion of the water which was required for the purpose of raising the ram and cage should run to waste. The means whereby this was accomplished was, roughly speaking, by applying pressure separately at different points of the ram, and, by keeping the pressure constant at one point and varying it at the other, the lift could be lowered with the loss only of the water used at the point of varying pressure. In the plaintiffs' invention the constant as well as the varying pressure was a water pressure. The defendants had constructed hydraulic lifts which, according to the plaintiffs' allegation, were identical with those of the plaintiffs, except that the constant pressure was a weight which was applied at a different part of the machine. The defendants denied the infringement and the validity of the patent, alleging that the plaintiffs' invention had been anticipated by an invention of a Mr. Berly, the specification of which was filed a few days before that of the plaintiffs. Among other witnesses the plaintiffs called Sir Frederick Bramwell, who stated that the similarity between the plaintiffs' machine and that of the defendants consisted in the use of an annular piston and in the operative water being separated from the force which did the balancing. The dissimilarity consisted in this—that, according to the plaintiffs'

drawing, the balancing water was in the annular area, while in the defendants' it was the operative water which was in the annular area, and that in the plaintiffs' the balancing was done by water pressure and in the defendants' by the weight applied to the plunger. The Attorney-General (Sir R. Webster, Q.C.), Mr. Moulton, Q.C., and Mr. Micklem appeared for the plaintiffs, and Mr. Aston, Q.C., and Mr. T. Terrell, instructed by Messrs. Wetherfield, Son, and Barnes, for the defendants. Mr. Justice Kay delivered judgment on the 19th inst. He carefully considered the specification of the plaintiffs and that of Berly, and pointed out that the object of the plaintiffs' invention was the economy of water, which was not the object of Berly's invention. He held, therefore, that Berly's invention was not an anticipation of the plaintiffs' patent, which he pronounced to be valid. As to the question of infringement, his lordship held that a patent such as that of the plaintiffs, being for a combination, would be infringed by the defendants if they had taken the essential part of it with a mere mechanical equivalent for the parts not taken. This, he held they had done, and that the plaintiffs were entitled to the injunction they asked and to the costs of the action so far as the same related to the plaintiffs' first patent. With reference to a second patent, as to which plaintiffs had abandoned their claim, his Lordship held that the action must be dismissed, with costs to be set off in the usual way. Upon the application of defendants' counsel, a stay of execution was granted for the purpose of appealing, and on behalf of the defendants, Messrs. Wetherfield, Son, and Barnes accordingly have given notice of appeal.

STATUES, MEMORIALS, &c.

Liverpool.—A statue of the late General Earle, C.B., C.S.I., executed by Mr. C. B. Birch, A.R.A., was unveiled by Lord Wolseley on Friday. It faces St. George's Hall, and represents the general in the act of leading his men over rocky and uneven ground with his sword held aloft. The statue is cast in bronze; the figure is 10ft. in height, and, with the plinth, measures 11½ft. The shield lying at General Earle's feet is a copy of one picked up on the scene of the action, and is now in the possession of Lord Wolseley. The sword is also an exact copy of the one the general carried when he fell. The clay model of the statue was exhibited at the Royal Academy in 1886, where it occupied the centre of the sculpture room, and was illustrated in our issue of May 14, last year.

CHIPS.

At a meeting of the Cambridge Improvement Commissioners on Tuesday, it was stated that the Surveyor (Mr. Wood) had presented to the Sanitary Committee a lengthy report upon the three rival schemes for diverting the sewage from the River Cam, and it was resolved that the same should be printed and circulated amongst the members of the board.

The public hall at Smethwick was reopened on Monday after alterations carried out at a cost of £500, from designs by Messrs. Harris, Martin, and Harris, of Birmingham.

A new temperance hall has just been erected in Wallingford. It is in the Queen Anne style, and will seat 300 persons. The total cost, with fittings, has been £390. Mr. S. C. Johns, M.S.A., was the architect, the work being carried out by Mr. Higgs, of Goring.

The Queen has been pleased to grant to Miss Charlotte Robinson, of Manchester, a warrant of appointment as Home Art Decorator to Her Majesty.

The Wesleyan chapel at Canterbury, built in 1811, has just been reseated and restored, from designs by Mr. Charles Bell, of New Broad-street, E.C., from whose plans a committee and class-rooms are being added to the schools at the rear. Mr. Walter Cozens, of Dover-street, Canterbury, was the contractor.

Colonel Rich has inspected the new northern extension of the Cleator and Workington Railway from Workington to Linefoot, where it joins the Bullgill branch of the Maryport and Carlisle line; and his report being satisfactory, a portion of the line from Workington to Seaton will be opened for passenger traffic at the New Year.

Sir Thomas Hesketh, Bart., turned, on the 15th inst., the first sod of the Stratford-on-Avon, Towcester, and Midland Junction Railway. The new line will be 11 miles in length, and will extend from Towcester to a junction with the Midland system, two miles north of Olney, and will form a new and direct route between Stratford-on-Avon and London. Messrs. R. Liddell and Richards, of London, are the engineers; Mr. Beverley Griffin is the resident engineer; and Mr. Saul Isaac the contractor.

Our Office Table.

A distinct and important stage has been reached in the Birmingham Improvement Scheme, for, as the town council were informed on Tuesday, by the letting of the portion of land in Corporation-street between the corner of Martineau-street and Barrow's stores, the last site belonging to the Improvement Scheme in the portion of Corporation-street between New-street and the Old-square has been disposed of. Not only is this the last letting, but it is the only remaining site to be covered with new buildings, with the exception of the corner on which stands the old Conservative Club House. The Improvement Scheme, originally suggested by Mr. Joseph Chamberlain in 1875, has been in progress during eleven years, and has involved a total outlay by the Birmingham corporation of nearly one and three-quarter millions, borrowed for sixty years for about 3½ per cent. The town's operations have thus far been attended with a loss, averaging from £20,000 to £25,000 a year; but this is steadily diminishing, and the deficit, which is this year only £9,800, is expected to decrease till 1894, and a surplus will afterwards, in all probability, be shown. An area of 218,000 square yards, largely covered with unsanitary dwellings, has gradually been acquired by the corporation, and has been relaid out, the chief thoroughfares being Corporation-street, Martineau-street, and Dalton-street. In the working out of the scheme sixteen public-houses have been abolished out of fifty-seven acquired, and about a thousand unsanitary buildings have been demolished, while others have been repaired and made healthy; but no blocks of artisans' dwellings have been constructed, there being no demand for this class of property within the cleared area, on which the Assize Courts, County Court, fire-brigade station, and other public buildings, have been, or are, being built.

Builders are slow to introduce any improvements in building appliances. It is only the force of example that has led contractors to adopt of late years the overhead cranes for building in lieu of scaffolding, though it had been largely employed on the Continent and in Scotland for some years. The American genius for invention has been turned also to account in various appliances and methods of construction. One of the useful appliances that might be more generally used is the scaffold brackets by which a plank or temporary scaffold can be supported on a couple of ladders. The bracket is of wrought iron, made in three sizes, for different widths of platform, the horizontal part holding the platform being hooked on one "round" of the ladder, while a racked catch is made to hook on to the round above.

Considerable alterations are being made in the neighbourhood of the Elephant and Castle. The widening of the Walworth-road has necessitated a longer girder bridge to carry the lines of the Chatham and Dover Railway, the works of which are nearly completed. The old houses are being demolished on the west side of Walworth-road at this part. Further up, where the six streets diverge opposite the famous hostelry of coaching days, a new public-house is being built on the site of the old "Rockingham Arms" at the corner of Messrs. Tarn's premises, which have frontages in the Borough and New Kent-road. We wonder if the alterations will be a real improvement to this great southern centre? Sometimes it is otherwise. The alterations at Camberwell-green have destroyed a picturesque and semi-rural locality by the erection of lofty shops, and it can hardly be called now a suburban residence.

Painters and sculptors, remarks the Paris correspondent of the *Daily News*, have no reason to complain of the Republic. There never were so many statues and sculptured monuments erected in honour of great men as within the last ten years. The bare walls of the mayoralties are being covered with decorative paintings of a high school of art, in which allegory is modernised and made to represent the poetry of everyday life. An exhibition has been opened at the Hôtel de Ville of the works of sixty-one artists, who are competing for an order to decorate the ceilings of the Wedding Hall at the Mayoralty of the Sixth Ward. The each send three subjects, which are to fit in as many square divisions. Each subject taken from the trilogy, Liberty, Equality Fraternity. The calm sentiment and the simp manner of Puvis de Chavannes has visibly in fluenced the artists. M. Besnard was allowe to send to this exhibition three panels for th Weddings Hall of the Mayoralty which face the Louvre. One has for subject The Mornin of Life, and represents a spring morning, fresh dewy, roseate in a South of France vineyar which is the scene of an idyll. The Evenin of Life is personified by a rustic Baucis an Philemon, who watch a mellow autumn sun set from a bench at the door of a thatche cottage.

We hear that the Post-Office building a Chicago has to be bolted together by iron rod owing to bad foundation and construction. I this is so, who is to blame? The idea of attr buting the failure to poor materials and fault construction, says the *Builders' Gazette*, is a balderdash, and points to the office of th supervising architect as the place where blam should rest. These buildings ought certainl to be models of good construction, if their in fluence on other buildings is to go for any thing.

Trade News.

WAGES MOVEMENTS.

Edinburgh Joiners.—At a meeting of th joint committee of operative joiners held on Satur day night at Edinburgh, it was reported tha twelve employers met on Thursday night last t consider the wages question; but owing to th smallness of the meeting it was not considere advisable to notify a reduction at once, but it wa agreed to issue voting papers to all the employer asking them whether they were favourable to a re reduction or not. Circulars were accordingly issue on Saturday. It was stated that the proposed re duction was neither warranted by the state of trad in Edinburgh nor the country generally; and i was resolved to warn all shops and squads to be o their guard, and to be ready to resist any attemp at interference with present arrangements.

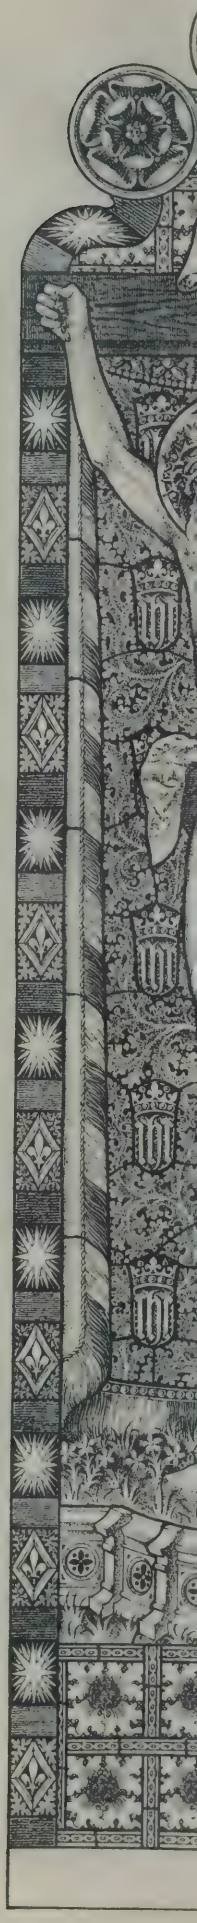
CHIPS.

At the last meeting of the Sheffield Schoo Board, a member called attention to the competi tions that had recently taken place amongst archi tects for plans for new departments. It seemed t him that the competitions were conclusively i favour of the capacity of Mr. Innocent to produce the required plans, and he suggested that the Board might very reasonably discontinue these competitions, which took up a good deal of time and also involved some expense. The chairman o the Buildings Committee said he believed the views of Mr. Leader were shared to a considerable extent by the committee. The subject dropped, no definite motion being made.

On Thursday Mr. J. T. Harrison, of the Local Government Board, held an inquiry at the Town Hall, at Newport, Mon., into an application of the Newport Town Council to borrow £2,000 for widening Skinner-street. After hearing the state ment of the borough surveyor, there being no oppo sition to the application, the inspector said he would forward his report in due course.

Dr. Theodore Thomson, who has been medica officer of health at Aberdeen for the past eighteen months, has received an appointment to a similar post in Sheffield at a salary of £500 a year.

Princess Christian unveiled on Friday, at the Royal Holloway College, a statue of the Queen, which has been executed in Tyrolese marble, by Prince Victor of Hohenlohe.



Henrich Ernst Schismer, for 35 years architect to the Norwegian Government, and the restorer between 1869 and 1871 of Drontheim Cathedral, has died at Giessen, Germany, to which town he had retired on a pension. He was 73 years of age.

The second annual dinner of the Birmingham Branch of the Institution of Civil Engineers was held on Thursday night at the Colonnade Hotel, Birmingham, Mr. E. Pritchard, M.Inst.C.E., in the chair.

Mr. T. W. Helliwell has just completed the glazing to the roofs of the new markets, St. Pancras, on his patent system, for the Midland Railway Company, the area covered being about 30,000ft.

ARCHITECTURAL ENLARGEMENT OF BUILDINGS.

THE difference between designing a building and enlarging or restoring it, is very considerable, as many architects know who have been called upon to enlarge an old house or church. Simply adding a room or two as a wing to an old house may be easy enough work, when plan only is thought of; but when the elevation has also to be considered, the architect is expected to exercise a good deal of skilful adaptation in bringing the new work into agreeable unison with the old, and avoiding the appearance of addition. Here, too, is a problem about which all are not agreed. Should the attempt be made to disguise the appearance of addition, or, on the other hand, to boldly pronounce it? Some are strongly of opinion an addition should be a combination—a uniting with the old in such a way as to make both parts look one. They say with some justice, that the whole effect should be studied rather than only a part; that the style should be carried out, and that the design of the original architect should not be destroyed or interfered with. Others think the accretions should be rendered visible, and that it is destroying the original architect's design to make an addition that will at once alter the proportions. Now, of course, the practical architect is the best judge as to which course he should pursue. Sometimes he may find it possible, without interfering with the original integrity of the design, to add a wing or two on either side of an old Classical type of house, or to extend a gable, or make an addition to an old Tudor or Jacobean building in the same style; at other times to treat his work as an independent addition, asserting itself as such, rather than to attempt to destroy or conceal the evidences of the older structure. Time's hand quickly subdues and harmonises, and whether we adopt the first or the second mode is a matter, after all, of little vital importance—so long as our work is not a deformity, or by its connection with the old ignores those first principles of design and good taste which ought to prevail. Unfortunately, an enlargement often turns out to be a monstrosity, a building higher and clumsier in detail than the original, and so awkwardly joined to the old that it destroys all the interest and merit of the original design. We can hardly think such an addition is the work of an architect, but of some builder who feels little interest, and who is ignorant of detail. Many of the old 17th-century houses have been mercilessly tampered with by village builders and carpenters who have been called in to add a new wing or a billiard room, or it may be only a bay window. Their work is sometimes a cruel distortion, though attempting to bring the new portion into harmony with the old house by making a gable, for example, of the same design or pattern as the existing one; though, alas! much wider, to suit the wider rooms. Of course the design is irretrievably spoilt by such an attempt at harmonising, and yet we have seen monstrosities of the kind perpetrated. As the curves of the gables had to be flattened vertically or expanded horizontally, the new gable looks more like one of those indiarubber toy faces which children can elongate or flatten. We might give as examples a few instances of the ludicrous attempts made by this class of builders to connect new and old buildings, or to bring them into "harmony." In one of these a gabled porch of the 15th century character was repeated to make another entrance, but so narrow as to cause the gable to look more like a huge pinnacle at a little way off, the idea of the builder being evidently to maintain—which he thought to be desirable—the horizontal lines of the façade; but the most barbarous attempt we have seen was the masking of an old brick 16th-century house by a "compo" front in "Classic." Without question, the "harmonising" mania has irretrievably ruined half of our old houses and churches. What would the old builders have done? We look in vain for any evidence of such additions as we have described; wherever they occur, they are perfectly independent in style, and seldom do we find any endeavour to bring into a balanced unison the new part with the older.

What do we find amongst our old churches scattered through the land? Aisles of later date than the naves to which they have been added; of different widths and heights; Late western towers tacked on to Early English churches; naves of different—often later—date than the chancels, sometimes of two or three styles. Early addition and later insertion are visible and recorded. Look at any ancient parish church, and see the diversity of the windows, both in size and style—here a Late, flat-headed Perpendicular window close beside one of Decorated or Early English character, there a five or seven-light window next to a double-light. The whole history and development of church architecture is a most instructive and interesting illustration of enlargement as carried on by the Mediæval builders. Had church architecture been practised on the modern builder's idea of making every new addition a copy, it would never have afforded the ever-fresh interest it possesses to all who can read history in stones; there would have been a sameness and repetition that would have tired and wearied. As it is, the venerable parish church unrestored, with its legends and traditionary lore clinging to it, is a time-written record in stone which all who run can read. Restore it, or destroy its 16th-century additions, and bring the edifice to one style throughout, and no one will care to look at it; even the modern architect himself will look at it wearily, and only because, perhaps, a Sir Gilbert Scott has had a hand in its restoration, or it is the design of some architect who has stamped his individuality upon it. It may be worth while to trace how the ordinary church grew and expanded itself as time went on. The history of every one of our cathedral churches exhibits the extension of the choir or the addition of a Lady-chapel eastwards; an extension of the nave, or a rebuilding of it—sometimes of the transepts owing to the fall of central tower; these various accretions to the original fabric being all visible and in different successive styles—never a harking back to the Norman of the original. We can verify this law of growth by an examination of Canterbury, Norwich, Winchester, or Ely, or any other of our cathedral churches. At Canterbury the steps are well marked and easily traced. We have first Lanfranc's Norman church, with its short old eastern termination and apse; next, its enlargement by St. Anselm or his prior, Conrad; afterwards follow the later rebuilding of the two Williams; and finally the additions of chapels and Beckett's crown. The progressive changes in the character of the work have been noticed by the late Professor Willis; and Gervase's description has been traced almost stone by stone. Thus in the "Choir of Conrad," begun in 1175, can be traced both Norman and Early English details. At Winchester, every successive stage is to be seen. The additions to the presbytery, the Lady-chapel, the encased Perpendicular nave are all distinctly traced, and the original Norman in the transepts of Wakelyn. In our parish churches a similar process of development is to be observed in the old cruciform plan. The addition of a north aisle to the nave, as Mr. Micklethwaite has observed, was about the first alteration. Next followed one on the south side, except where that was impossible. Then we find an extension of the nave westwards, and the addition of a western tower; and, finally, the addition of a clerestory to the nave. The addition of aisles often destroyed the original cross plan. In all these changes no attempt was made to make the additions harmonise with the older work. On the other hand, we see aisles tacked on to the old nave of very different widths and heights, and with details totally dissimilar. The modern church architect has imitated the result without observing the principle of growth. He plans his church with nave and two aisles, chancel, vestry, and organ chamber—a copy of the old church with its four centuries of accretions; but his work looks mechanical and uninteresting. Accidental additions, the growth of ages, have been copied by him as a perfected arrangement, without thinking that had the old builders the planning of a new church for a large congregation, free from the restrictions of the Norman building, they would have set about a different plan.

But what we have mostly to observe is that these additions to old churches assumed a character of their own, and that no effort was made to disguise them by making them appear portions of the original design. The original plan had to be enlarged, and the builders set about it in a practical, commonsense manner, with no intention of inducing people to believe the church was originally built so. Every addition to such a building must more or less destroy the original design or make it subserve its new purpose; to try and make them agree would have ended in failure. Regular or symmetrically planned buildings are always less easy of enlargement than those of irregular shape, and hence it seems to be the duty of an architect who has the design of a building, say a block of schools or a hospital, to consider the probabilities of extension. A regular plan defeats this attempt, but an irregular one can often be developed with success. On a cramped site the structure may therefore be designed more as a perfect whole. Probably we have, for these reasons, an explanation of the prevalence and popularity of the irregular or Gothic styles for country buildings, and the Classical styles for town edifices. Take again an old parish church. The increasing accommodation necessary led the Post-Reformation builders of the 17th and 18th centuries to add galleries as the only method of enlargement to aisled churches; the Gothic revivalists sometimes increased the church by adding transepts. Even the galleries had the merit of being genuine additions, without any intention of being otherwise than means of increasing the number of seats, and on that account are historic records of the age of the Evangelical revival of the 18th century, when Wesley and his followers drew large crowds.

We have pointed to a few examples of enlargement with the object of showing that additions to a building cannot be always made to assimilate or agree with an original plan. Wherever the attempt has been made to add a new wing or an aisle and make it agree with the old design, the success has been very questionable, unless the architect has provided for additions in his plan. In all buildings where enlargements are contemplated, the architect would be consulting his own interests and those of his employers by sacrificing an immediate perfection of his design to providing for its future realisation. In the erection of new churches this plan ought to be invariably adopted, instead of following the common practice of building a complete edifice—cathedral-like in its com-

pleteness—which has no provision for the demands of a growing parish. In many of our recent edifices this precaution is being taken, thus adopting the sensible course which the old Mediæval builders of our churches followed in many instances.

RESPONSIBILITIES OF ARCHITECTS AND BUILDERS FOR STRUCTURAL INJURIES.

THE divided responsibility of the owner, architect, and contractor in a contract for building has made it sometimes rather difficult to say whether a contractor is really to be held liable for any failure or accident that may occur during the progress of the work. We will take a very usual instance. A builder takes a contract to pull down and rebuild some premises. The old party wall has to be under-pinned, and made thicker, to carry additional stories, and after the work has been proceeded with and nearly completed, the adjoining owner's wall settles, causing unpleasant cracks to appear in the rooms. The adjoining owner, therefore, claims damages of the building owner, which, of course, he has a right to do, for the injury done to his house. The fact that one house is in contact with another, and that one of them, more or less, receives support from the other, imposes an obligation on the building owner to use increased care in taking down his building. The adjoining owner may have a "right of support" by virtue of which he can apply for an injunction to restrain the building owner, or if injury has been caused, he can bring an action for damages—one or both of these remedies are open to him; but even when he has not acquired the right of support, he can still call upon the building owner for redress, and who will be responsible for any damage he may have caused. We may say, indeed, according to the ruling of the Courts, a man has no legal right to underpin a party-wall between his own and his neighbour's house if by so doing he is risking the safety of the latter, though it would often be impossible to know whether the underpinning could be safely performed or not. But to proceed with our supposed case. The building owner being called upon to pay damages for the injury caused to his neighbour's house, looks to the builder for restitution. Is he liable? The latter can say he has carried out to the letter the intentions of the architect, that every care was taken to prevent any injury to the adjoining building. In turn he says the employer or his architect are responsible.

On sifting the cases that have been brought before courts of law, it will be seen that the owner is generally held responsible, if he was aware of the risk attending the alteration. The reports of these cases are, however, conflicting with the general rule of law, which makes a contractor liable for the negligence of his workmen, and therefore it is safer for the architect or builder to rely upon the actual facts of the case. It may be reasonably asked how an employer is to know the pulling down of a building will cause an injury to his neighbour; the architect and builder are the individuals who alone ought to know whether the demolition or alteration they make is likely to inflict an injury on a third person. Yet there is a dictum of law that every person who directs the doing of an act which cannot be done at all without inflicting injury on a third person is personally responsible to that person. The taking down a wall from which an adjoining building has received some degree of support (though not by right or prescription) may be regarded as such an act, though the building owner may be quite ignorant of the results likely to follow its removal. But let us refer to two important ruling decisions, from both of which it appears that the above dictum is sustained. The first one is "Bower v. Peate." The owner of a house ordered it to be pulled down, and the foundations excavated and the house rebuilt by a contractor who was instructed to take all necessary precautions, but who failed to underpin the next house, the consequence of which was that it was injured. The owner was made liable for damages, although the builder undertook the risk of supporting the plaintiff's house and to make good any damage arising from the operation. In another instance ("Percival v. Hughes") the same principle was held. An owner employed an architect and builder to rebuild his house, and when the staircase was being constructed, the workmen negligently, and without the knowledge of the defendant or his architect, cut into the party wall on the opposite side, which caused the defendant's house to fall and to drag over the party wall of the plaintiff, thereby damaging his house. The operation of cutting into the wall was not required, nor hazardous if carried out with skill. The House of Lords decided that the law cast a duty upon the defendant to see that reasonable care was exercised, and he could not get rid of the responsibility by delegating the work to a third person, and was liable to plaintiff. So that, according to this decision, a building owner is called upon to see that reasonable skill and care are exercised in any operation performed by the contractor he employs, which involves a risk to the party wall. The parties were owners of adjoining houses, and the party wall was the property of both. The decision is one that cannot safely be relied on in the majority of cases, for an employer cannot be supposed to be competent to say whether reasonable skill and care were being exercised by the builder. In other instances the legal tribunals have maintained that where the work is of a hazardous kind both employer and builder are responsible. Of course, if an employer interferes with and controls the builder, he makes himself liable under all circumstances. The one question to be settled in all operations of this kind is that of risk, or whether any injurious consequence to the adjoining owner is expected to arise? If there is none, the contractor is liable; if there is, the employer may become responsible by any accident or injury.

The subject is so important to builders and architects that we have adverted to it at some length. The architect is often involved in some unforeseen accident arising out of the construction. He owes a duty to his client in preventing him from undertaking any hazardous work, on the other hand, and the contractor looks to him for advice. Plans and specifications may be scrupulously full and exact, and measures of precaution may be provided for in carrying out the work; still, there has been miscalculation somewhere, perhaps in the foundations, which has caused a settlement or a crack in the adjacent house. The French code is very stringent in defining the architect's responsibility. He is held responsible if he fails in superintending the work; if he permits a defective foundation to be built on; or allows the use of improper materials. If he directs a defective mode of construction, he and the builder are both liable, and his responsibility extends to the term of contractors' liability of ten years. In this country, unfortunately for architects, the question of responsibility has to be decided by judges and juries who have no practical knowledge of building. It often happens that when a contractor is held liable under his agreement for some injury to the premises of a third party, he is ready to cast the blame on the architect. In a question in our Intercommunication columns the other day, a case in point is given. The owner of an adjoining building claimed damages for an injury done to his gable by the new building, the increased weight of which had caused the injury; the employer called upon the contractor, who in turn looks to the architect. Such instances are not rare. The owner or his architect can obtain from a contractor an indemnity against any damage caused by the work, and it is only in this way that any difficulty can be removed. In many contracts there is a clause to the effect that the contractor is to be held responsible for and make good all injuries, damages, and repairs to the building and adjoining premises, and to hold the employer harmless from any claims for injuries to persons, or for structural damage to property through any neglect or want of proper care in the execution of the works. The builder, of course, who contracts with his eyes open will not by such a clause be led into a trap; but will, by increased forethought and examination, before he signs the contract make sure of any risk, and be better prepared to meet any emergency should it happen. It is in the interest of both the contracting parties that possible responsibilities should be foreseen and met. Responsibilities of the kind we have been discussing are entailed in all buildings, but more especially in the rebuilding of premises adjoining other property. The dealing with party structures always involves a certain degree of risk, more particularly when the walls of the adjoining premises have to be underpinned for the purpose of extending the depth of basement of the new building. In the metropolis there is a certain procedure described by statute, though instances of failure are common. A building owner is allowed to pull down or raise any party structure on condition of making good all damage arising therefrom to the adjoining premises, and the Act imposes certain duties on both him and the adjoining owner; but in other towns the work is too frequently left to the builder, who consults only the interests of his employer, and thereby brings upon him the penalties of the law, should any damage to the adjoining owner's property be inflicted. Both parties have rights which it is the duty of the architect to see have been carried out.

"BUILDING NEWS" DESIGNING CLUB.

REVIEW OF DESIGNS—SUBJECTS A AND B.

THE conditions and instructions for these subjects were printed in the Building News for November 4th last, and in order to judge of our award, reference should be made to that number. Over a hundred drawings have come to hand.

A DETACHED VILLA RESIDENCE, TO COST £1,500.

"Ghost," as a whole, is the best. He realises very nearly the proper idea which should govern the design for a modest villa of this type, and his scheme, while having the merit of compactness, has also the reasonable chance of being executed for the money stipulated. He fails to show how his basement would be arranged, and he does not supply seven bedrooms. These are omissions, because the instructions stipulated for them. The superiority, however, of the plan outweighs such objections, though it is but fair to the other competitors to say that they have been duly noted. The point to which we would direct attention is that "Ghost" concentrates his administrative part of the house very cleverly. There is nothing novel in this, but in a small house compactness must of necessity dominate; next, it must not be cramped, giving odd nooks and quaint corners, which may be all very well, and no doubt picturesque; but they overcrowd a small place, give it a fussy effect, cause endless trouble to keep them clean, and, what is more important still in a problem like the one before us, they cost money. First of all we will run through "Ghost's" plan, and note its faults. The front door is a little too much out of sight, making the tradesmen's door a competitor, in spite of the big gate at the corner. The entrance-lobby doors awkwardly swing against the drawing-room doorway. The

screen in the hall is unnecessary, but may have been introduced by too literal a reading of our instructions, which said that the staircase was to be screened from the entrance. We really intended that it should be out of sight of the front door by being contrived, so to speak, round the corner. The hall should have a fireplace in it, and the way to the basement ought to be better protected from the tradesmen's doorway. The kitchen is rather small. The store has no window, as all stores should, and the lobby next the back door is not big enough for practical people; while the servants' w.c. is in a thoroughfare too nearly in view of the tradespeople's door. There seems no fault with first-floor plan; and the top floor would comply with the instructions if the box-room were changed into a bedroom and a box-room managed out of the landing. The latter is not too light, and the bedroom over the kitchen would be rather small when the slope of the roof is taken into consideration. With such an indictment some may question our award, especially should their own plans not be found fault with in detail. Want of space precludes, of course, our printing such an essay. The architectural treament of "Ghost's" design may be judged by the illustration printed herewith. There is a breadth and dignified character about the house which seems to be obtained without apparent effort and with simple detail. The competitors for the second place are not easily arranged in their order of merit, and most of them fail because of the expensive character of their plans. A bad design, however, is dear at any cost, and in judging between members of our club we also must consider the points gained by merits of draughtsmanship. "Boreas" is the motto of the design which in the main deserves the second post of honour, in spite of the fact that the building looks very like a small schoolhouse as seen in the sketch. The plan is a nice one, roomy and compact, though needlessly crowded in the offices. The landing is good and the lighting is ample. A door here and there opens the wrong way, and the building is not so cheap as "Ghost's" in its finishings. We illustrate it on another page. "Northumberland" comes next with a simple arrangement of gables which attracts our attention, and in some respects we rather like his plan, though the hall is not wide enough; while a great waste of space is consequent upon the passage running along the dining-room wall from the tradesmen's door to the kitchen. The elevation facing the main road is very pretty, notwithstanding the fact that the perspective makes the building look like a toy house. "Faith" should arrange his drawings in one sheet, or at most, two, and in no case on four. All that need be shown can generally be set out on one sheet, and for illustration purposes this is a necessity which cannot be ignored. His design is of a very superior order as compared with many before us, but he has made his building too expensive for the limit named. His hall, its vestibule and landing, are a trifle too extensive for such a small house; but they are none too large in themselves, and would be very convenient. The hall, though, is none too light, and the kitchen is not an inch too big. We believe in "Faith" and hope for more from him. The arches of his porch in perspective are drawn very badly, and he ought to know better. "Aughrim" has a practical plan and a good elevation, free of fuss, and well considered generally, though crude in details of arrangement. The author has a right notion in the main, and will, with study, soon win a place in our club. "Uncle Toby" is too fond of corners in his planning, bringing his rooms together in a chance sort of way, which shows him to be a trifle careless in his work. This will not do for a man who can devise a front elevation like that before us. The perspective, too, needs more care. We note the merits of the plan, but expect better work next time. "Uncouth Swain" is a follower of Mr. Ernest George, whose influence seems now to have superseded that which Mr. Norman Shaw in his palmy days held among students. He follows his master without method rather, and without much regard to £ s. d. His composition is pretty, and his plan is clever, based, however, on the idea of a larger building, partaking too much of the character of a big house cut down. With good taste, and a little more care, "Uncouth Swain" will deserve a more refined motto. Draw by preference in pen-and-ink in future. "Use," with the late E. W. Godwin's house at Northampton in his mind, exhibits, in a bald way, and crudely drawn, by no means a bad style of small house, which would look better in execution than here. The hall is roomy and the circular staircase in the turret is ingeniously managed; but this kind of staircase is not the best for ordinary use and service. Draw more neatly, and in a more finished style on better paper. "Netsukie" we praise for his good taste in avoiding what designers call "features" and his common-sense treatment of plain breadths of walling. His design wants "go," and is devoid of relative proportions which constitute the spirit of architecture even in the smallest examples. The plan is spoilt by the unfortunate way in which the staircase is pushed up a passage beyond the service door. Do not wash over your section another time. "Brickbat" makes a design which fails because it attempts too much in the elevation, "putting it all on in front," so to speak, and on plan space is wasted in the hall and landing; added to which, on the ground floor is the ugly elongated vertibule passage. The sheet is nicely arranged; and the drawings are neatly finished. "Exonia" is free from the last-named competitor's faults, and seems a better architect than draughtsman; but his designs, if not shown in a more careful way than the sheets before us, will never stand a chance of illustration in our pages. The back staircase is unnecessary in so small a house as this. The porch to the front entrance is a proper feature, in spite of the balusters; but generally the composition externally is too commonplace. "Ars Longa" is a Scotch-like design, very well studied in detail, but somewhat pinched in effect on the front façade. Had the projecting central gable been dropped a floor, and greater prominence been given to the main gable at the angles, the elevation would have been very much better. The bedrooms are not well contrived, and double the number asked for. The central area in so small a building is quite unnecessary, and is a bad arrangement. "Transome" copies a house in Collingham-gardens, and "Mumps" does the same, only with a trifle more skill, though with even less regard to financial consequences, giving a house which would cost nearly double the amount at our disposal. We cannot go, therefore, into details with either. "Milosis" demands attention, because he endeavours to meet our instructions, and that with fair success. His second staircase, facing the tradesmen's door in a lobby all to itself, and going right up into the attics, could only be proposed by a man having no experience in housekeeping or management. We need say no more: the objection is fatal. The landing on the first floor slices the house into two, and wastes good space. The elevation is rather clever, and so are the drawings. "Jumping Frog" proposes an ambitious country residence in every way beyond our means and intentions. We can see that he knows what he is about, and draws well, taking pains with his work; therefore, we expect him to rank higher another time. "Pupil" and "Westminster" conclude the designs classed among those of the first order of merit.

The contributions which rank second are too numerous to allow of our particularising them in detail; but we have carefully arranged them in order, and thus name their mottoes. "Lawton's" house would be a fairly good one; the hall would look spacious with the screen at the end, and the elevation is effective. The porch to "Huz's" design is too large and clumsy, making the hall dark, and overcrowding by its scale the otherwise neatly composed façade. "Simplex et Prudens" suggests a familiarity with the red-brick houses of Queen's-gate and Cadogan-square. In this study he is right, and we commend him for following good examples. Cost is against him this time, else the building is not a bad one. Had his drawings been better, he would have been placed much higher in our list. "Spare Time Well Spent" draws well, and should spend more of his leisure in the study of good examples of house-building. With this his results will no doubt improve. At present he lacks ideas. "Hudibras" is too lordly in style with the tall portico to his front door. It puts so false a face on a simple man's home, and is out of place in such a house. "Ossian," if not so niggling, would be better than the last; but then his hall has no light whatever. "Bee" has a really good plan, but his elevation looks all doorways of all sizes. "Hernani" is simplicity itself, and poor in style; but the plan ranks high in our opinion, though it is wasteful on the ground floor in its administrative parts. "Mancunium" is less compact still, and rambles about regardless of roofing and money. "Rusticus" will do better, but his plan is crude, and his elevation is wanting in composition and proportion. "Samivel" knows how to plan, but not quite how to design, a house externally. The view is chiefly answerable for our opinion, as the front elevation is passable. "Wolfruna" is scrappy and scratchy, both in drawing and design. "Abington" draws in elevation well, and ought to rise soon. "Veritas Vincit" has a barbaric porch, but otherwise not a bad notion generally, though in detail his plan is poor. "Aidsan" is certainly clever, but not so economical as he should have been. "Tat," to you we say ditto. "Janitor" makes shaped gables a strong feature with poor effect. "Midas" draws with spirit, sketches well, and plans badly. "Cosmos, jun." cramps his kitchen, and draws his staircase window out by the acre, so to speak, for it is enormous in size. "First Attempt" will, we hope, do better next time. "Alban's" plan is better. Note rule about size of paper. "Coila" comes next with a broken-up design, and then "Beamish Boy," who gives us a hall far too large, but nice drawings. "Solus" and "Recruit" follow, the latter having one big gable like a town-house rather, and two halls which are wasteful. "Streona" gives a house as one of a row; and, like him "Etna" is lacking in style, in spite of good draughtsmanship. The others placed in the second class are "Glencoe," "Apex No. 1," "Henery," "Leodiensis," and "Buggins."

In the third series we arrange the remainder thus:—"Lotus," "'Arry," "Compta," "Rab," "Leonhardt," "Acute Angle," "Crom-a-Boo," "Design," "Towser," "Nabob," "Texas Bill," "Chimo," "Young Albion," "Rob Roy," "Angle," "Beaumont," "May Fly," "Midland," "Nemo," "Jack," "H.M.S. Conway," "Bagged Ape," "Civis Mundi," "Celt," "Pedro," "Lancashire Lad," "Elean," "Frost," "Venator," "Liso," "Power," "Lucilius," "Sapphire," "Tempus Fugit."

We propose to notice the designs for subject B, "A suite of dining-room furniture," when we illustrate the best design sent in.

NOTES FROM EDINBURGH.

THERE have been no clear indications till very lately, here as elsewhere, of reviving trade during the past year, but building operations have been extensive. The comparative relief from complete stagnation, which has been more or less the case of late years in Edinburgh, has passed into the stage of apparent promise of prosperity. Building operations have never been on so large a scale since the time, ten years ago, when the high wages began to fall. The average wage for the preceding year, 1886, was from 6d. to 6½d.; it is now 7d. or 7½d., and will remain at this figure whilst large contracts are being executed and speculative schemes astir. In districts advantageously placed by railway access or passenger cars the speculative builder is still providing fresh accommodation, as indicated by the proceedings of the Guild Court. The Northern Cable Tramway system has been virtually started, and many new four-storied tenements of good class have been, and still are being, erected at Golden Acre, the present terminus of that system. In the districts of Mayfield, Morningside, and Murrayfield, where the Suburban and Caledonian Railways have provided liberally for the convenience of passenger traffic, great additions to the city have been made. West of Merchiston, about 150 acres of land beside the Craiglockart Hydropathic Establishment are now to be laid out for villas and tenements of similar kind, and as the builder is busy in the heart as well as the extremities, the prospects for the coming year cannot but be promising as far as labour is concerned. Contracts are not probably so profitable as in brisker times, and are certainly less plentiful, but a revival of trade is prophesied as likely to take place. If wages are lower now than they were ten years ago, the prices of lodging and provisions are

much less; as also the prices of materials—circumstances which must not be overlooked in estimating more hopefully the present aspect of affairs.

Among the permanent attractions of the city, the Forth Bridge may be considered one likely hereafter to attract visitors from all quarters of the world. During the fine summer and autumn of the past year great numbers have gone daily to inspect the works, and for this every facility is afforded by the contractors. The completion of the three gigantic towers (to which the cantilevers are attached), 350ft. high, forces itself on the notice of the spectator from even the most distant heights; but perhaps the best impression of their altitude is got by contrast with the hills on either side, as they are seen from the entrance to Leith Harbour on sailing up the Firth. The work of extending the cantilevers goes more slowly on, and it requires great faith in most people to believe that, when they are completed, means will be found to stretch girders 40ft. deep and 350ft. long between their extremities. Excellent photographs, both on a large and small scale, are to be got, showing both the general design and details of the construction.

The cable tramways for the Northern District have just commenced to run, and are another attractive novelty for the season. The trial trips have been satisfactory, and it is understood that the remaining section, to acommodate the Stockbridge district, will be immediately begun. The engine-house and sheds are located midway between the present terminations in Princes-street and Ferry-road—i.e., in Henderson-row. Here the company has reared a tall chimney, which, however, adds only one more to the many factories, &c., which have been allowed to take possession of what might, with more advantage to the city, have been healthy recreation ground, and an adornment in place of disfigurement to the locality. The engine is horizontal, driving three wheels, and is about 180H.P., with two large boilers for using alternately. The engine and machinery for driving the cable are housed in a shed, with handsome gallery, from which the whole apparatus can be inspected. The front towards the street projects beyond the line of houses to allow of the passage of the cars to the turntable, which carries them back into the shed. This front is in two floors, of low elevation, and the whole treated in too ponderous a style, the upper part having a very heavy lumbering appearance, which is not helped by putting a heavy cornice moulding, where a stringcourse is the proper architectural detail. The system adopted in Edinburgh has some novelties designed by the engineer, Mr. Colam, which make the working more equable and secure under the enormous strains on the cable, when stopping or turning the somewhat sharp curves of the roadway. Each car carries sixty passengers—first, second, and third class—and has four wheels before and four in the hinder part, each wheel with its own brake and four supplementary brakes which can be forced down upon the roadway. The gripper has also a novel arrangement, which improves the security of its hold on the cable, and allows greater freedom in removal of the cars.

The access to St. Bernard's Well has been greatly improved by a handsome flight of steps and ornamental gardening. The bank of the Water of Leith is guarded by a parapet wall of good design, and the well itself and statue of Hygeia, in the summerhouse over it, will no longer be suggestive of discomfort, and give occasion to youthful admirers to treat the latter with the hard hits which had disfigured the statue. The interior of the chamber is being decorated with a very elaborate design in marble mosaic. The water is sulphurous and harmless, taken in any quantity, and the well has always had a band of early visitors, which will now be greatly augmented. This work is the gift of the late Mr. W. Nelson, who has also made some important work of restoration in the Castle. Of these the Argyle Tower had been completed before his death, and he had the satisfaction of knowing that the work met with the unqualified approval of the authorities and the public generally. The building is now a small, square tower rising a little above the line of the lower fortifications, with house on top of it, and so agreeably breaks the monotony of appearance presented by the latter. The details are all in keeping with the surroundings and the workmanship excellent. In the hall or Parliament House of the Castle the workmen are putting in new windows and restoring the interior, which retains the ancient roof. The windows have heavy mullion and transom, of proportions rather wide than lofty, which suits the low elevation of the courtyard front, with its heavy cornice table; but exception must be taken to the insertion of a new string-course below the windows, omitted in the original design, as it very much intensifies the low altitude of the quadrangle front.

The vacancy on either side of the U.P. Synod Hall in Castle-terrace is now filled up by the large erections of the School Board offices to the south and St. Cuthbert's parochial offices on the north. Juxtaposition does not improve the appearance of Sir James Gowan's *magnum opus* or that of its companions. The St. Cuthbert's offices are designed in the Scotch Baronial style, which, in the larger examples, has much of massive breadth relieved by picturesque variety. But in this case this point of affinity with the Cyclopean masonry beside it has been altogether sacrificed to meet modern requirements in its many floors; and with the long, slender lines of its projections in bay windows, &c., it is more like the Perpendicular Gothic than the Scotch, and makes unseemly contrast with the almost Egyptian repose of its gigantic neighbour. The School Board offices are much better, as more in harmony with the adjoining street. The Synod Hall frontage is really nothing but a wall-screen of monster proportions, and the effort to evolve the picturesque at the side of it might have been spared with great advantage to the aspect of the three combined. This appears to have been dominant in both the new erections, and we have accordingly a square sentry box planted on the corner of the School Board buildings, whilst a Scotch house, with a much more perilous altitude, adorns the long angle tower of the St. Cuthbert's Building.

A good deal has been done, as in past years, in redressing shop fronts and rebuilding. It may be assumed that the speculative builder is now more sharply looked after in matters sanitary, and there is no marked alteration in the style of building, if we except the tendency, mostly in shopfronts, to adopt a more decorative treatment, generally borrowed from that negation of style known as the Queen Anne Renaissance. In porches, shopfronts, and details of doors and windows, &c., the influence of the mantelpiece and overmantel is conspicuous, as also is the more general use of leaded lights of stained glass. Some show a marvellous delight in the pediment of the Queen Anne, and plant it everywhere, very frequently in transom lights of doorways, of bad proportion, to exclude the light. Its attenuated lines and minuteness of detail are altogether unsuitable for out-of-door work or dusty and dirty weather, and unless carefully varnished and washed at least once a week, the result is a disagreeable and dirty look, which makes the spectator regret the labour spent on the details. There is less of ornamental frippery in the stone, and a block of houses near the Barclay Church is evidence of the capabilities of the style, which seeks to combine the Gothic and Classical ideal. In the obscure Lady Lawson street or wynd a very elegant and somewhat original building has been erected, of the Jacobean period, as a front to the premises of a cattle sale shed, and here and there reconstructions are often a great improvement. None of these later variations, however, are really any improvement on the stately buildings of purely Classic design; and though considerable licence may be granted to shops projecting beyond the solid masonry of the streets, these accessories are better, perhaps, at least for display of goods, with plainer detail and seemly proportions. The somewhat obtrusive London house-front of the Café Royal in Princess-street is covered with detail, which is lost in the near distance, and more suitable for a mantelpiece or a sideboard than the solid piers of doors and windows.

One new church has been opened during the past year, as in the preceding, and the present needs of the city appear to be supplied. The Braid U. P. Church is an octagon, and, like Free St. Andrew's, is designed with the circus arrangement. The latter forms a very imposing architectural addition to the street, its magnitude being out of all proportion to the accommodation, which is moderately large, for 750. The style is Early Renaissance, and the church proper is buried in its accessories in the way of porches, staircases, and passages. The grouping of the principal and subordinate buildings in the frontage is very good, and there is a splendid flight of steps to the loggia. This is made rather gloomy by four projecting piers, which look as if they had no business there, carrying nothing—not even the usual vases and flower-pots. The magnitude and consequent cost of this edifice, which, though plain in style, has been nearly double the ordinary expenditure per sitter, is occasioned by the large floor space set aside for corridors about the auditorium, lobbies, and other spaces. The interior, however, cannot be considered in any respect as an improvement on the old-fashioned arrangements of the continuous-galleried church. The light is badly distributed, and the attempt made to give the pulpit command of both area and galleries has resulted in bringing the latter too near the heads of people underneath it. The octagon, as most architectural students very soon discover, cannot be made pleasing or dignified as an exterior, except on a small scale or in conjunction with a large building. This difficulty has not been overcome in this latest sample of the octagon. St. Stephen's is also octagonal in plan, and on a greatly larger scale; but Playfair masked the octagon to get breadth for his frontage and the tower. It is not easy to imagine any great advantage in the curious arrangement for either sight or hearing when the congregation is of ordinary size, unless the advantage of everybody seeing everybody is taken to account. These modern samples of the arrangement are very inferior every way to that which has been long approved in St. Andrew's Church, where the plan is an ellipse with little eccentricity, and the pulpit placed at the extremity of the minor axis. The interior is very comfortable, and egress by three doors, immediate, and without any exterior corridors, except that in the vestibule in front. The roof flat is not very sightly, as it lies obliquely; but the circular church, with fine spire in front, is beautiful beside the monotonous proportions of an octagon. Professor Blackie has compared the design to an archangel astride on a beer barrel; but the contrast between the body of the building and the spire is hardly so bad as that.

THE ROOF OF THE NATIONAL AGRICULTURAL HALL, KENSINGTON.

At the meeting of the Civil and Mechanical Engineers' Society held on the 21st inst., Mr. Arthur T. Walmisley, M.Inst.C.E., read a paper on the construction of the roof of the National Agricultural Hall, opposite Addison-road Station. The building was designed by Messrs. Henry E. Cox and Stephen Robinson, both now deceased. Messrs. Max. am Ende and A. T. Walmisley were engaged as joint engineers to assist the architects in the preparation and carrying out of the ironwork contract. The light appearance of the construction which has been adopted was attained not by sacrifice of safety, but by adaptation of every detail to meet the various stresses found by calculation, in order to avoid any unnecessary surplus material, and by a careful study of all the possible stresses resulting from equal and unequal loading, including the effects of wind pressure in varying directions. In bridge construction or in a railway station roof the use of webs and flange-plates seems quite reasonable; but in a roof such as this, where all the ironwork is under cover, it was felt that an opportunity was presented for a greater development of the parts, and a design remarkable for an entire absence of long wide plates and webs was accepted, in which the various parts of wrought ironwork are composed wholly of flat bars and angle irons riveted together, plates being only introduced where required for covers in the joints. Mr. James Edmeston was appointed architect after the deaths of the original designers, and the work was carried out for about £131,000 by Messrs. E. Lucas and Son, the general contractors, and Messrs. Handyside and Co., who arranged the ironwork, amounting to 1,200 tons, and Mr. T. W. Helliwell, who carried out the zincwork and glazing. The great hall of

the main building covers a rectangular space of over 2½ acres, being 440ft. by 250ft. between walls, and its erection was personally superintended by Mr. Am Ende and by the author. The main ribs have a clear span of 170ft., and are placed 34ft. apart, forming eleven bays between the end screens. The clear height to the crown of the roof is about 100ft. The main ribs are of box-girder shape, 7ft. deep and 2ft. wide, the lattice construction adopted enabling the material to be placed further away from the axial lines than is usual when plates are introduced. Although the soffit of each main rib is semicircular from a level of 15ft. 9in. above the ground, the constructive rib itself springs from a higher level, and should therefore be described as a segmental rib. The open space under the curved roof amounts to 374ft. by 170ft., or nearly an acre and a half in the clear. This is surrounded by a gallery 40ft. wide upon the north, the west, and the south sides, and 26ft. wide upon the east side. The gallery is covered by a lean-to roof, which abuts against the curved rib upon the north and south sides, and is attached to the horizontal member of the screens upon the east and west sides. Below the top of the roof over the side galleries the arched rib forms on each side an ornamental spandrel, which rests upon a column, the resistance to the thrust being assisted by the lean-to roof over the gallery. The connection between the main rafter of the side roof and the arched rib is formed by a top plate, which practically acts as a hinged joint, whereby the complication of a fixed connection does not occur in the calculation of the stresses. The main rafters of the side roof are connected to a braced frame of 14ft. effective depth, and the thrust is thus conveyed down to a foundation girder 12ft. deep, which is continued horizontally underground to the base of the columns supporting the main arched ribs. Thus the surrounding brickwork is not called upon to resist any portion of the thrust of the arched roof, as the side frames through which the gallery floor passes form a self-contained system of ironwork in which the thrust is ultimately conveyed to the ground. The chief points of support to these side frames are formed in each case of two main concrete blocks, one placed at the lower outside corner under the outside wall, a cast-iron bed-plate being built into this concrete block to receive the side frame, and the other placed under the base of the pivoted column. The foundation girder of the side frame is placed with its top flange 6in. below the floor level, and is embedded in a mass of concrete to protect it against the effects of dampness. The mechanical couple required at the springing of the rib to maintain its rigidity is supplied by the main rafters and the transverse floor girders of the side galleries. The upward pressure is neutralised by the whole weight of the structure resting upon the column, which is under all circumstances sufficient to resist the upturning action of the abutment when the wind is blowing upon the opposite side. The maximum load upon the column under the springing of the rib amounts to 49½ tons upon the lee side and 82½ tons upon the weather side. These columns are made of cast iron, and are constructed with a true ball and socket bearing at each end, which is concealed at the top by a foliated capital, and at the base by a casting which gives the appearance of an ordinary column. By the introduction of the pivoted connection the strains which these columns resist are always vertical, and, therefore, definite. This would not be the case if the connections were made rigid, as the facia girders supporting the inner sides of the gallery are continuous girders, and would be constantly exerting excessive bending movements of various intensity in the columns, to say nothing of the indeterminate stresses which might be caused by the ribs. These gallery facia girders have curved bottom flanges, and continuous girders of the same type are placed vertically immediately below the point of junction of the side roof with the curved rib and radially throughout the curved rib at distances 18ft. 6in. apart to act as main purlins. These purlins have been made continuous from screen to screen, to avoid the necessity of strengthening the flanges of the purlins between the main ribs, and for appearance sake to avoid great differences in the size of the diagonal bars forming the web. Another point of detail is the simultaneous application in the arched roof of radial and tangential purlins. The curved roof is surmounted by a ventilator, between which and the side roof a steel-framed ladder of light construction is introduced upon both sides of the arched roof in place of the ordinary gantries. The screens which close the semicircular ends of the arched roof consist of a vertical ridge and furrow construction, whereby the appearance of the usual heavy horizontal members in a gable screen is avoided. This construction offers great resistance to wind pressure combined with a minimum amount of weight and material. The framework of this part of the structure is made of mild steel. The covering follows the zigzag-shaped surface resembling corrugations, and presenting a near approach to a folded curtain screen. The wind bracing has not been indiscriminately introduced throughout the structure, but has been confined to the side roof and the two end bays of the curved roof, the nine intermediate bays of the curved roof where it is not required being free. The inner longitudinal girders to the gallery floor, at a distance of about 14ft. from the outside wall, upon the north and south sides, are continuous girders. The cast iron columns upon which they appear to rest contain the wrought iron member of the braced framework. This member, which is formed of four angle irons in a cruciform section, takes the tension produced by the thrust of the roof, and is jointed by cover angle irons to permit the body of the column being slipped over it during erection. The caps and bases to these columns were made as split castings—*i.e.*, castings made very thin (about $\frac{1}{16}$in. in vertical lines) upon opposite sides, but of the proper thickness all round so as to be easily divided into two upon these vertical lines when required to be fixed, and so to provide a true curved surface at the joints. They are then joined by a plate let into the surface and connected by tap screws. This vertical member is constructed to act both as a strut and a tie. The intermediate floor girders and the intermediate purlins in the arched roof have their bottom flange constructed in a fish-belly-shape with the object principally of preserving a uniform section for the diagonal bars. At the east and west ends the columns are placed at 34ft. apart, the same as those upon the north and south sides, dividing the span of 170ft. under the screens into five bays. Compared with other roofs of large span, the iron roof is both a little wider and a little higher than St. Pancras Station. Owing to the spread given to the feet of the ribs and the holding-down bolts being placed at a distance apart of 11ft. 5in., they act with considerable leverage, and prevent the stresses in the rib causing any change of angle at the feet of the rib. The theoretical effect of this arrangement is similar to that produced by making girders continuous over piers, and reduces the stresses in the rib to about half the amount that would exist if the ribs were hinged or unsecured at the abutments. By this means a great saving of metal is effected, which is an important consideration in roofs of large span, as the road increases in a much greater ratio than the span. In addition to the massive abutments there are also horizontal girders running across the station below the level of the rails to carry the platforms, and with a view to insure perfect stability a wrought iron tie runs below these girders consisting of a $\frac{5}{8}$in. plate riveted to the bottom flange of the wrought iron main-floor girders. The cost of the iron and steel work erected complete has been from £26 to £27 per square of 100ft. superficial area. The author has subjoined a calculation of the stresses in the main ribs assuming the wind to blow horizontally and to act normally upon the curved surface. A wind pressure of 30lb. per foot super. has been taken. The Metropolitan Board of Works have no fixed rule upon this point. The unit pressure they adopt depends upon the height and position of the building under consideration, and the method which it is best to adopt in estimating the amount of pressure is also much open to dispute. Further experiments need to be made before a satisfactory conclusion can be arrived at.

CALCULATIONS OF STRESSES.

The equations have been deduced from the following works :—"Civil Engineering," by Professor Rankine ; "Die Lehre von der Elasticitat und Festigkeit," by Winkler ; "Stresses of Rigid Arches," by W. Bell, M.Inst.C.E. ; and "The Theory of Arches," by Max. am Ende, M.Inst.C.E., have been employed in the following consideration of the calculation of stresses in the main principal.

I. $\Sigma - Fx + 2H(b + y) = 0.$
II. $\Sigma Fxy - 2Hy(b + y) = 0.$
III. $\Sigma Fxz - 2Vz^2 = 0.$

Σ = Sum.
F = Force at the various points.
x = Leverage of force.
H = Horizontal thrust at the crown.
b = Vertical distance of H from the crown.
y = Vertical distances of points round which moments are taken from the crown.
z = Horizontal distances of points round which moments are taken from the crown.
V = Vertical shearing force at the crown.

Statement of Equations for Dead Load.
Load being symmetrical.
Equations I. and II. only will be required.

I. $-2 \times 3541 + 2 \times 6Hb + 2H154 = 0.$
II. $2 \times 137631 - 2Hb\,154 - 2H6324 = 0.$

Solving H = −19·7.
b = + 4·3.

Statement of Equations for Wind Forces :—

I. $-3588 + 2 \times 6Hb + 2H154 = 0.$
II. $151503 - 2Hb\,154 - 2H6324 = 0.$
III. $259227 - 2V20678 = 0.$

Solving
H = + 12·5
b = − 1·75
V = + 6·27

The strains in abutment framing are worked by the method of moments, combining the thrust of the arch rib with the loads on the galleries as they occur in the various members. The greatest stress in the flange of the arch rib occurs where the curve of equilibrium is farthest removed from the neutral line of the rib. By taking moments round the flanges :

Stress in flange at a = − 15·83
" " " b = + 63·33
Stress in one set of diagonals between a and b = − 6·5 tons
Each set being in duplicate stress in each bar = − 3·10

It is announced that Sir Robert Rawlinson, C.B., chief engineer of the Local Government Board, who is in his seventy-sixth year, has tendered his resignation, and is leaving Whitehall at the close of the present week.

FIRE PREVENTION AND EXITS FROM PUBLIC BUILDINGS.*

I PROPOSE to refer chiefly to theatres; not, however, because other buildings can be exempted from restriction, but because theatres present greater difficulties and dangers than other buildings. There is greater liability to fire in a theatre, and greater danger in the event of fire, so that, if we shape our regulations to secure the safety of theatres, we shall much more have secured the safety of other public buildings, provided that we make the latter amenable to corresponding restrictions. It is acknowledged on every experience that the existing regulations, not merely in Glasgow, but throughout the kingdom, are inadequate. The authorities charged with the administration of these regulations are alive to the responsibility of their position, and are conscious of the insufficiency of their powers, and that they would welcome any discussion that should contribute to the formation of a strong, united, and reasonable public opinion on the subject of the regulation of such buildings. The best restrictions are those which leave the most liberty—the most, that is, within defined limits—and these the very limits that a proprietor and architect with sufficient knowledge of the subject and due sense of responsibility would have voluntarily adopted in the absence of all restrictions. I do not propose to confine myself to legislative restriction. It is my purpose rather to note a few of the points that should be kept in view with reference to safety in designing a theatre, and to point out where the designer should be controlled by regulations. My wish is to bring before you some of the points which most urgently claim the attention of those whose duty it may be either to design a theatre or to frame regulations, and to invite discussion on them. The subject falls naturally under two headings:—1st, Fire, its prevention, restriction, and extinction; and 2nd, The safety of the occupants of a theatre or other building in the event of fire or panic. One point of a general character may be said to be common to both divisions of the subject—the situation and surroundings of a theatre. Obviously the situation of a theatre is of the first importance in regard not only to its own safety, but also to that of surrounding buildings. The ideal site would be one isolated on every side. The Italian Government have recently enacted that every new or reconstructed theatre shall be so isolated, and Messrs. Henry Irving and Alfred Darbyshire have together produced a plan for a safety theatre which is supposed to have open frontages on every side, or, failing that, at least a carriage-way all round it. The only objection to this is that it is almost impossible of attainment, in this country at all events, however desirable it may be. As an ideal, it is good; and if we can even approximate to it in practice we may congratulate ourselves; but as an enactment it is out of the question. We may, however, enact that a theatre is not to be smothered up among other buildings as so many at present are, and, I think, the sooner we do make such an enactment the better. The regulations of the Metropolitan Board of Works and those of the Lord Chamberlain's office are silent on the subject. After all, the safety of a theatre depends more upon its immediate proximity to a street than upon its having access from more than one street. I should rather have a site having one ample frontage and with no other buildings intervening between the theatre and the street, than one surrounded with other buildings and having access only by means of passages or lobbies through those other buildings. The New York Building Law, as amended in the present year, provides that every theatre shall have at least one frontage on the street, and it requires also a certain amount of free space on each side of the auditorium, with balconies at the level of each gallery, and stairs to the ground. The enactments of this law are so complete and effective that I shall have occasion to refer to them repeatedly. The enactment secures a free space all round the three sides of the auditorium, with ample means of egress in each of the three sides. The ordinary means of ingress and egress are confined to one side, and they are on such a scale that the theatre could be quickly emptied by their means alone. The other two sides are wholly occupied with emergency exits, so that it does seem as if the means of escape was developed in almost the highest degree possible. And yet it is accomplished without laying any oppressive restriction on the proprietor. I do not think that we shall find anywhere in this country a theatre whose plan is arranged upon better or safer lines than those of this enactment. We come now to the first of the two headings already given—Fire: its prevention, restriction, and extinction. There are few places that offer more risk of fire than the stage of a theatre, and still fewer that present such opportunities of swift destruction. Two improvements suggest themselves at once here—the first, that electric lighting should take the place of gas on the stage; and the second, that the scenery and drapery should be protected by treatment with some non-combustible solution. The electric light has now been introduced into so many theatres, and its advantages are so universally admitted, that it seems unnecessary to enlarge upon them. In Paris its use is compulsory; in New York it has not been made compulsory. There can scarcely be any difference of opinion regarding the advantage of fire-proofing the scenery so far as that can be done. Such preparations as cyanite and pyrodene are well known and largely employed. Mr. Verity, surveyor to the Lord Chamberlain, writes, regarding the former:—"By its means scenery, canvas, &c., can be rendered entirely incombustible without interfering at all with the usual processes of the scenic art." While everything should be done to render the scenery unburnable, too much reliance should not be placed on this precaution. The fire at Exeter is believed to have originated with gauze mediums which had been steeped in alum. Professor Watson Smith admits that wood treated with pyrodene is not fireproofed through and through, but that only an outer fireproof covering is given to it. My own experiments have led me to believe that it is not rendered incombustible, but only less easy of combustion. Again, the scenery of a theatre is constantly changing, and nothing but constant—almost daily—inspection could insure that it is always subjected to this protective treatment. I would certainly enact that it should be so treated. I would endeavour to enforce the enactment rigidly; and then I would act with reference to other precautions as if there were no provision of the sort at all. The situation of workshops, painting-rooms, property-rooms, and store-rooms is important with reference to prevention of fire. The Board of Works Regulations provide that no workshop, painting-room, or dressing-room shall be formed either over or under the auditorium, and that no scene-dock, property-room, or store-room shall be permitted unless separated by brick and fireproof construction. That is very well, but it does not go far enough; it allows a workshop over the stage as there was at the Exeter theatre. Such as it is, it may be questioned if it is enforced. Dr. Percy recommends thin, mild steel or iron as a substitute for wood, and wire gauze instead of canvas; the stage to be iron trellis, covered with papier-mâché boards. While the Board of Works prohibits workshops, &c., over or under the auditorium, the New York law goes a step further and prohibits them over or under either auditorium or stage, or in any of the fly galleries. They may be in the rear or at the side of the stage, but must be separated by brick walls, the openings in which must have double wrought-iron doors. Generally speaking, the New York Act provides for fireproof construction throughout, all walls and partitions being fireproof, as well as the entire main floor of the auditorium and vestibule; also the entire floor of the second story of the front superstructure over the entrance lobby and corridors. Even the shelving and cupboards in the dressing-rooms, property-room, and other storage rooms must be of metal, slate, or other fireproof material. The exception to this rule is the roof, which is not required to be fireproof. The roof is, in fact, severely let alone in this Act. It would unquestionably be a great improvement if we could make the roofs of our theatres fireproof. Many of our theatres at present have iron roofs, while in Mr. Terry's theatre the roof is iron and concrete. Next to preventing a fire altogether, the best thing is to confine it to the smallest possible area. It is of the greatest importance that the different parts of which a theatre is composed should be divided from one another by solid fireproof walls and floors. The corridors, lobbies, stairs, and vestibules should be absolutely separate from the auditorium. The stage should be separated from the auditorium as far as it is possible to be so. The question of an iron or other fireproof curtain has been much discussed. The authorities in Paris have made an iron curtain compulsory, and such have been introduced into several theatres in this country also. Asbestos has been used in Mr. Terry's new theatre by Mr. Walter Emden, and this material is recommended by Messrs. Henry Irving and Alfred Darbyshire. The New York Act makes a fireproof curtain compulsory, but allows it to be either of metal or of asbestos, or similar fireproof material. It also wisely insists that it "shall be raised at the commencement of each performance and lowered at the close." In connection with provision for the restriction of fire, an important matter is the restriction of the products of combustion, smoke and noxious gases, and their diversion from the audience. In a theatre fire the loss of life is usually due almost entirely to suffocation, caused either by the smoke and poisonous gases from the fire, or by the congestion of the audience in the stairs and passages. In some of the most fatal theatre fires that have ever occurred it has been said that not one person was burned to death. Frequently the smoke from the burning stage fills the auditorium and overpowers the occupants of the gallery before they are able to escape, and in this consists the great value of a fireproof curtain, that it may confine the smoke to the stage for a time at least. The lesson of the Exeter Theatre would seem to be clear that, among the dangers of a burning theatre, that from smoke is one of the deadliest, and that a passage connecting the stage with the foot of the gallery stair is among the most fatal defects a theatre can have. The control of the smoke arising from fire on the stage, even from fire in front of the stage, is a matter that must engage the most serious attention of the architect. It should be cut off if possible from all passages, lobbies, and stairs, and a means of escape must be provided for it elsewhere. There should be one or more shafts over the stage which would admit of the escape of a large volume of smoke. Mr. Terry's theatre is so provided. Mr. Henry Irving's proposed theatre is also provided with a smoke shaft. A clause in the New York Act provides for shafts over stage, protected by thick glass skylights. By opening up the roof of the stage we may be increasing the rapidity of the fire, but we must run that risk, as it is essential that a means of escape should be provided for the smoke and gases of combustion; but it would be well if we could secure that all doors to the stage should close automatically, and be as nearly as possible air-tight. If the fire then found an open way upwards, it would at least not be fanned by blasts of air from below. The question of the extinction of fire is very important. If a fire in the scenery of a theatre is to be extinguished at all, it must be caught at the moment of outbreak, and unfortunately the point at which it originates is usually not very accessible. I would say this about hydrants and hose pipes—have them by all means, but distrust them. There is one other means that may be employed and that seems to offer a prospect of being effectual. I refer to sprinklers. These are of two sorts: those worked by means of valves and those having fusible plugs, which are melted by the heat, and the water thus brought into action automatically. Mr. Walter Emden has made use of sprinklers, but declines to adopt the automatic principle. His plan is to have them worked by valves, not in the flies or any place of danger, but at the stage door. There is no doubt at all that sprinklers are the most effectual method that has been devised for extinguishing a fire. I go further, and say they are the only means yet discovered which can be relied upon with reasonable assurance to extinguish a fire amid scenery on the stage of a theatre. The inference to me seems plain, that they should be introduced into every theatre. There is a difference of opinion as to whether they should be automatic or worked by valves. One objection to automatic sprinklers is that the heat of the stage might occasionally melt the fusible plugs of automatic sprinklers when

* A paper read before the Architectural Section of the Philosophical Society of Glasgow, December 12, 1887, by T. L. Watson, F.R.I.B.A.

there was no danger of fire. The usual temperature at which the plugs are arranged to melt is 160 degrees, and the sprinklers would serve a useful purpose if they only insured that the temperature was never raised to that point. I admit, however, that the risk of opening when they are not wanted may be an objection to the fusible plugs. But it is one that is overborne by the great additional security against fire which they offer. I do not think it can be argued that they are unsuitable for theatres when I say that they are rendered compulsory by the New York Building Act. With the automatic sprinklers we avoid several distinct elements of uncertainty that attend the use of valves; there may be no one to work these valves; those on the spot may be ignorant how to work them, or they may lose their presence of mind. When found, they may be out of order, or too stiff to work. At the very best some time is lost before they are operated. With the automatic sprinklers the water is discharged the moment it is wanted, and at precisely the spot where it is wanted. Further, the best automatic sprinklers have never been known to fail. They have always extinguished a fire with merely trifling damage. Of course there is a slight possibility of accident, and of some destruction of scenery with water. There is a risk even from ordinary water pipes and hydrants, and there is a risk from sprinklers worked by valves. All things considered, I arrive at the conclusion that automatic sprinklers are by far the most reliable method for the extinction of fire on the stage. Next to them I place the sprinklers worked by valves—a long way behind, but a long way in advance of any other method. We come now to consider the means of escape of an audience in the event of fire or of panic. The auditorium of a theatre usually consists of the parquet, and at least two tiers or galleries above it. Sometimes there are four tiers above the parquet, as at the Haymarket Theatre, London; but the more usual number is two or three. Messrs. Irving and Darbyshire's proposed model theatre shows only one gallery; but we doubt if such a plan will ever become general. Assuming a theatre, then, which may have several tiers or galleries, we have to consider (1) the number (2) the width, and (3) the general character of the exits. The New York Act provides for every theatre accommodating 300 persons two exits, and for 500 persons three exits; but it does not increase the number for larger audiences except when the number of galleries is increased. It also provides that each gallery above the first shall have a separate and distinct exit; but the main floor and the first gallery may have but one exit between them, provided its capacity be sufficient. Thus the number of exits in a three-gallery house may be three only, or one less than the number of tiers, including the parquet. The number of exits here specified, in the case of a large theatre, would certainly be insufficient, although, of course, the fewer there were the larger they would each have to be. The Metropolitan Board of Works requires one exit for each floor or level, and one additional communicating with all the floors or levels. The number here seems a reasonable one, although there might be great danger from an exit stair communicating with all the levels or floors. The ideal theatre, if it is a large one, should have two exits from each floor or level, though not necessarily separate and independent, to the street. If we cannot get this we should insist that from the upper floor or gallery, if it seats more than say 500 persons, there should be at least two exits. It must, however, be always remembered that the safety of a theatre will depend, not merely on the number or the width of the exits, but on their skilful and careful arrangement, and that for this no regulation will provide. We come now to the important question of the width of exits in proportion to the number of persons who are to use them. This matter has never been fully discussed, but is well worthy of consideration. There are several rules in force in different places; but these differ from one another so widely that it must follow that some of them are either insufficient or excessive. Mr. T. B. Jackson, the first person to write on the subject, suggested as "a safe basis – viz., to allow 15in. width of exit for every 100 seats in a house—that is to say, 12½ft. for 1,000, 25ft. for 2,000, 37½ft. for 3,000, and 50ft. for 4,000; and thought with such exit any two-gallery house can be emptied in five minutes, provided all the passages, lobbies, and staircases were proportioned to the same." The London Board of Works Regulations say: "No staircase, internal corridor, or passage-way for the use of the audience shall be less than 4ft. 6in. wide. Every staircase, corridor, or passage-way for the use of the audience, and which communicates with any portion of the house intended for the accommodation of a larger number of the audience than 400, shall be increased in width by 6in. for every additional 100 persons, until a maximum width of 9ft. be obtained. The New York Act says: "Stairways serving for the exit of people must, if straight, be at least 4ft. wide between rails, and if curved or winding 5ft. wide; and for every additional 50 people to be accommodated, 6in. must be added to their width." Lastly, the rules drawn up by the Glasgow authorities, but not yet enacted, declare that "The exit or exits for the first floor shall not be less than 1ft. of width for every 70 persons who can be seated in said floor or section thereof. Where there is more than one floor, the number of persons to be allowed to be accommodated in each upper floor shall be diminished in the proportion of ten persons for every lineal foot in width of exit for each floor of the building ascended; and no building, or part thereof, shall be used as a place of amusement unless there is exit not less than 4ft. in width."

One other matter may be referred to—the width of passages in auditorium. The clause in the New York Act seems to adapt itself to circumstances. It is: "All aisles in the auditorium shall have a width of at least 22in. for every one hundred persons, or part thereof, and no aisle shall be less that 3ft. wide at its narrowest part, and the same shall be increased in width towards the exit at least 1in. for every five running feet or part thereof." Captain Shaw contends that the lobbies, corridors, and landings of a theatre should be sufficiently large to contain the whole audience without crowding, and gives 250 square feet for each 100 persons as the space required. This is precisely what is demanded by the New York Act. It does seem more than the bare requirements of safety call for, but undoubtedly it would add to the comfort of the house. The last point to touch upon is the general character of the exits. This is very much a matter for careful planning, for which rules cannot be laid down. A few suggestions only can be given. A long, straight passage, and, still more, a long, straight stair, are open to the danger of accumulated pressure from a crowd seeking to escape. Stairs turning at a right angle, and thus going round a square on plan, are probably the best, and each flight should consist of from six to eight steps. Steps doubling back on themselves are not quite so good, because the people at the inside, next the newel, have so much less distance to travel at the landings than those next the outer wall, that the movement is not uniform. The people are not only moving out; but they are necessarily struggling past one another at the same time. A wheeling stair on a large scale would obviate that difficulty; but to it there is the fatal objection of the accumulated pressure. On the whole, I believe the best stair for a crowd is one going round the four sides of a square, with the corners rounded off, and with, of course, landings at every corner. It has to be said that we cannot always get such a stair; but it is good to know what is best, and to approximate to it as nearly as we can. The proposed Glasgow rules provide for steps not more than 6in. high; that is too small as a maximum. A gallery stair might well have 7in. risers; in New York the limit is 7½in. Handrails are of the very utmost importance, and it would be well if we could arrange that every person in a crowded stair should be able to hold on to one. It has recently been proposed in the professional journals that handrails should be carried up every stair less than 2ft. apart, so that each person should have hold of two all the way down. I should be content to have them 3ft. 6in. apart, so that each person should have hold of one all the way. There is one danger attaching to stairs which is, at least, minimised by giving to each person the opportunity of supporting himself by means of a handrail. In going down a stair the foot has to be placed precisely on the tread of the stair. If it is advanced an inch or two too far, or not far enough, you almost certainly fall. With a panic-stricken crowd this is only too likely to happen, and the handrails are wanted to minimise this danger. A correspondent of the Building News of September 16th proposed that instead of steps inclined planes should be employed; he did not state what inclination. A few weeks afterwards our secretary, Mr. Miller, made the same proposal, suggesting a rise of 5ft. in 12 or 13, or about 1 in 2½. The idea is a somewhat taking one, as it would obviate the danger of tripping to a considerable extent; but it may be open to a still more serious objection. The accumulated pressure would be much more dangerous in the case of panic than even the risk of tripping. On this subject Captain Shaw tells us that a gradient for a crowd should not exceed one in ten. "When there is a gradient," he goes on to say, "it is most desirable to avoid any pressure near it—as persons, after entering a gradient downwards, invariably attain an increased speed, and if this be further accelerated by pressure from behind, accidents may happen." In connection with doors, I may refer to what is called a "panic exit lock," invented by Sir George Hayter Chubb. On the inside of this lock there is a plate displaying the word "push," and with the slightest pressure on that plate the door at once flies open. I have now indicated some of the points that must be considered in connection with theatre-building in the future. I have tried to show what is required to secure almost absolute safety. I have no doubt that many persons will think some of the conditions unnecessary, and some of them unduly onerous to proprietors. I am far from saying that a theatre is unsafe unless every precaution that I have referred to is taken. I have tried to show rather what should be aimed at in the endeavour to produce a theatre in which serious disaster would be impossible. I think, for my own part, that the time has come for stringent legislation with reference to new theatre buildings and, in a modified form, to existing buildings. No doubt great hardship, and even injustice, will be inflicted upon proprietors. I do not see that it is within my province to enter on that branch of the subject. But I may say that proprietors have a right to know exactly what is to be required of them, and that as soon as possible. It is of more importance to them than to any one else that there should be real safety in a theatre and a sense of security in the public mind. And, lastly, something of compensation should be derived from the reduction of insurance premiums. The proprietors of the Grinnell Automatic Sprinklers state generally, and not with reference to theatres, that, on the introduction of their appliances to a building, mutual insurance companies reduce their rates from 20 to 50 per cent., and tariff companies from 20 to 30 per cent. There would be here a saving that itself would justify considerable expenditure. I need scarcely enlarge on this side of the subject, as it will be admitted on every hand that what is really required to insure public safety should be made compulsory. It is not good to have one authority at the same time framing regulations, administering them, and sitting in judgment on their administration. It is a high testimony to the ability, fairness, and moderation with which these different functions have been exercised by various bodies, that they should have worked even so well as they have done; but it is no reason for the continuance of an arrangement which is at the best anomalous and unsatisfactory.

THE METROPOLITAN BOARD OF WORKS AND THE THEATRES.

At Friday's meeting of the Metropolitan Board of Works, Mr. Shepheard, the chairman of the Building Act Committee, brought up a report on the recent charges in connection with the supervision of the construction of theatres in the metropolis. The report, which possesses a special interest just now, in view of the total destruction by fire of the Grand Theatre, at Islington, on Wednesday night, stated that the attention of the Building Act Committee had been called to certain public statements of recent date with respect to the Avenue Theatre and the Oxford Music-hall, to the effect that in each of these cases the Board's regulations for the construction of places of public entertainment have been in-

fringed with the connivance of the Board. The result of the committee's investigation was that the Avenue Theatre had been erected on a portion of the land acquired by the Board for the formation of Northumberland-avenue, at the southern end of Northumberland-street. The drawings submitted by Mr. Sefton Parry for its construction were approved by the Board on the 10th of December, 1880, upon the recommendation of the committee, and the Board's certificate under the Metropolis Management and Building Acts (Amendment), 1878, was sealed and issued upon the completion of the building on March 10th, 1882. The 11th of the Board's regulations enacted "that no workshop, painting-room, or dressing-room shall be formed or constructed over the auditorium or in the space under the same." Section 12 of the Act of 1878 empowers the Board to make, alter, vary, or amend any regulation. The specific charge made against the Board in this case is that a suite of dressing-rooms has been permitted to be constructed under the auditorium, contrary to such regulation. The committee admit that there are dressing-rooms under the auditorium, and they were aware of this fact when they recommended the drawings for approval, and mentioned it in their report to the Board. But they also mentioned in the same report an important fact—namely, that these dressing-rooms (each of which is shown on the plan to be lighted and ventilated from the external air, and is surrounded by a brick wall), are separated from the auditorium above by brick arches 9in. thick at the crown, the haunches being filled in with concrete. Under such circumstances, the committee recommended the Board to exercise the power conferred upon them by the 12th section of the above-named Act, and to dispense with the regulation as to the dressing-rooms in the case of the Avenue Theatre, which was done accordingly. The second instance referred to in the public Press—namely, that of the Oxford Music-hall, in Oxford-street, was of a totally different character, coming, as it did, under the category of an old building, having been licensed before the passing of the Act of 1878, and could therefore only be dealt with under the 11th section. The charge made against the Board in this case is that the hall was rebuilt, but that it has no proscenium wall as required by the fourth regulation. This statement is incorrect in more than one particular. The hall was not rebuilt, but merely had such alterations made to it as were specified in the Board's notice. The Board did not consider it necessary to order a proscenium wall to be erected at this music-hall, and such a requirement would have been contrary to their usual practice with regard to music-halls. The report was approved and ordered to be printed and circulated.

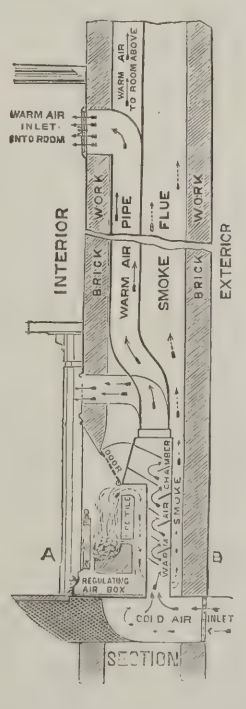
STANDARDS OF PROFESSIONAL MEMBERSHIP.

TO raise the standard of professional requirements is now the one great subject of discussion in this country as well as in America. Architects of the States are combining themselves for the purpose of obtaining some recognition of an architect's qualifications. In America, as in England, the profession of architect has been an open one, with the result that anyone having a knowledge of drawing plans on one hand, and of building cottages on the other, considered he had a perfect right to assume the title of architect. The Committee on Professional Requirements, which have been discussing the subject in connection with the Western Association of Architects, have submitted a report, in which the question is dealt with. The chief difficulty they had to consider was the standard for admission to membership. By fixing this too high the growth of the Association would be checked, and its usefulness impaired: a large number of practitioners of average capacity would be excluded. If the standard were too low, on the other hand, the membership would lose character and tone. This difficulty is one which every society has had to face in the enrolment of its members, and is one which the Federation Committee will be called upon to deal with sooner or later. The report of the American Association is dictated by a broad policy. It objects to set up "factitious barriers" against those who ask for admission; it wishes to "count amongst its members every thoughtful, earnest, ambitious man in the profession"; it desires that its strength and stability should be derived from the standing and capacity of the average man; it encourages the fervour of youth, the honourable record of old age. The leading desires of the Association are that the applicant should reveal an honourable career, give evidence of "fair artistic, constructive, or executive skill." These motives are excellent in themselves; but, unfortunately, it is easier to express in general terms the objects to be aimed at, than to be prepared to carry them out in a practical manner. An honourable record should, of course, be one of the first requirements of an applicant for membership, though it is one that cannot very satisfactorily be proved. Evidences of fair artistic and constructive skill are more within the scope of an examining committee's functions, though experience has shown that candidates with very little artistic feeling or discernment obtain admission, and constructional knowledge may be learned without any constructive ability to apply scientific principles to actual work. We believe the American architects have wisely resolved, prior to raising the standard for admission, to declare the standard which they are willing should govern their own course. They suggest the promulgation of a code of ethics which shall define a desirable relationship of the members of the association to one another, and to the incorporate body; and the report recommends the preparation of a code to be considered at next year's convention, in the consideration and composition of which every State is to be represented, and the several reports be collated, the consensus of the revisions being brought up. Before influencing outside members it is necessary that a society should institute, for their own guidance, some general rules, and acknowledge certain requirements. It ought not to be hard to define what those should be, and towards the preparation of some practicable scheme we may suggest the following. It is now a standing requirement with most societies that a member shall have been in practice some years—say seven—and have carried out certain works. As a proof of the character of the buildings executed, photographs may be usefully called into requisition when the works are not known, and a pledge given that the buildings have been erected from the designs and under the supervision of the applicant. For this purpose it would be necessary for him to supply the name of the owner and that of the contractors. In addition to this practical evidence there ought to be a guarantee on the part of a member to agree to certain rules of practice—for example, that he should strictly confine himself to architectural practice and surveying and their allied branches, and agree not to receive commissions from builders or tradesmen directly or indirectly; to adopt a scale of fees approved by the society, abstain from unprofessional dealings in relation to other architects, and undertake to promote professional attainments and the standing of the architect in every way that he can. Modes of conducting business, the management of contracts, and the relations with the contractor ought to be agreed upon. These are the practical qualifications which might be considered sufficient to enable any architect in practice to join. But there are other requirements necessary for a large number of applicants who have not been in practice long, or who have not carried out buildings, and for all students desirous of becoming members. For this class of persons a preliminary examination becomes necessary; it should at first be elementary. The applicant may prefer to elect himself the kind of examination—whether it should be written or oral, and on what subjects. Others may submit probationary work, measured drawings, or designs. At a first examination, we believe the subjects would be better left to the students, from which they could select those they would like to be examined in. Thus one individual strong in construction might be willing to subject himself to an elementary examination on the properties of building materials, the theory of their strength, and their application; another might be better informed on general architectural facts and building trades, and be willing to be tested on the characteristics and history of the styles of architecture of any particular period, or of the principles of the trades. Candidates devoted to one class of work may prefer that class of construction to be made the subject of his examination. Young surveyors would prefer specifications and methods of estimation. By leaving to each applicant the selection of his own class of subjects, a sufficient test could be established as a preliminary condition of membership, and with the prospect of enrolling all the more competent members of the profession, be they architects, civil engineers, artists, or surveyors. The standard could be raised every year. One uniform system would be impossible at the initial stage of registration or enrolment; it would meet with little or no response from the rank and file of the profession, and would reduce the number of applicants. The Surveyors' Institute have three main subdivisions in which they examine candidates—the first taking in land and estate agents, the next valuers, and the third building surveyors. An architect's examination should, in the same way, divide the subject into three or more parts—one to include artists and decorative artists; a second, the practical architect; the third, the surveyor or engineer.

SEWAGE TREATMENT.*

THE sewage question has been so completely threshed out by those who have written and compiled treatises and handbooks, that it is somewhat doubtful whether anything more can be said on so problematical a subject. These books have been chiefly the works of theorists or inventors and of practical engineers, and have been addressed chiefly to local boards and sanitary authorities. "Sewage Treatment, Purification, and Utilisation" is the title of another practical manual for the use of corporations, local boards, medical officers, and others, by Mr. J. W. Slater, F.E.S., the late editor of the *Journal of Science*, and who writes upon the subject with a practical knowledge of the question. Mr. Slater comes to the conclusion that there is no one process universally applicable. We agree with him there. The author deals with the various systems of disposal and treatment of sewage. No one will gainsay his remarks on what he calls the Bazalgette system, the discharge of sewage into the river through storage tanks, and the costly scheme of conveying the sewage down to Thames Haven in a colossal culvert 20 miles in length. The method of irrigation under certain conditions is recommended, and Mr. Slater points out some of the objections to irrigation of the ordinary kind. Where suitable land is available, the aspect warm, and the drainage good, irrigation is probably one of the best methods of disposal; that it destroys the morbific germs has been denied, though such destructive action must take place if there is sufficient aëration of the soil. Irrigation, to be adopted advantageously, ought to be carried out with some means of screening the coarser sewage, and hence precipitation processes are useful and allow the more fluid part of the sewage to enter the soil. Mr. Slater does not favour "intermittent downward filtration"; he says that the soil would quickly become waterlogged, and the quality of the soil would be ruined by the intermittent doses. Precipitation processes occupy a long chapter, which is prefaced with a few remarks on the principle of action by chemical agents. The author writes: "It is said that chemical agents, though they may clarify—*i.e.*, withdraw suspended impurities—cannot purify—*i.e.*, they are unable to remove dissolved impurities." It is difficult to understand how any chemist can make such an assertion without placing himself in a dilemma. "It is further evident that suspended organic matters, under which heads we must include living organisms, the germs of disease and putrefaction, must, in the strictest sense of the word, rank as impurities. If we remove them we, *pro tanto*, purify the water. It is also known there are two methods, if not more, in which dissolved substances can be separated from the solvent liquid—precipitation, in the strict sense of the word, and occlusion or absorption. In a well-planned precipitation process these

* Sewage Treatment, Purification, and Utilisation. By J. W. Slater. London: Whittaker and Co.



two modes of action are systematically combined." The author shows how this can be effected, and how dissolved organic compounds can be precipitated. "By occlusion a dissolved substance can be thrown down, not by forming a definite chemical compound with some other body introduced, but by becoming entangled in its pores. Gelatinous silica and hydrated alumina, when freshly precipitated, are capable of thus entangling dissolved organic matters." Having disposed of the assertion that organic impurities dissolved in water cannot be got rid of by chemical agencies the author proceeds to deal with the question, What organic matters can be eliminated by chemical processes? Mr. Slater mentions albumen, gelatine, mucus, peptones, and other compounds, and all those most likely to occasion mischief on decomposition of blood are amenable to precipitation. Pointing out the properties required for a precipitating agent, the author says it must be cheap, not actively poisonous like certain salts of lead, nor such as yield an alkaline effluent, thereby excluding lime which renders effluent water alkaline, thus favouring decomposition. Speaking of those agents which are free from objection, he names first the salts of aluminium, which are cheap, colourless, and harmless. They have a great affinity for organic matter. The best of these salts is said to be the hydrated chloride known as muriate of alumina. We cannot enter into all the *pros* and *cons*, but recommend the chapter to all interested in precipitation. The author's practical chemical knowledge has been called into requisition, and the question of precipitating agents is certainly one that only an expert chemist can deal with. Other good precipitants are soluble salts of manganese. The manner of precipitation or the best means of employing the agents is considered in some detail, and a plan of a system of tank is given now in use at Aylesbury. Some good advice follows on "bogus" patents and contracting for purifying sewage. Other chapters of the book deal with deodorising destructive processes, such as that patented by the late General Scott for cement-making, sewage manures, and there is a very complete list of sewage patents, with abstracts of specifications for the chemical treatment of sewage. All local authorities will do well to read the book.

THE ASSOCIATED CARPENTERS AND JOINERS' REPORT.

THE twenty-sixth annual report of the Associated Carpenters and Joiners has been issued by Mr. James Beveridge, Glasgow, the general secretary. In the outset details are given of various disputes in Scotland and England, and in the whole of them the employés are stated to have been successful. One of these occurred in Edinburgh, where the men, "by a short and sharp struggle, succeeded in raising the standard value of their labour to 7d. per hour," or an advance of ½d. on the old rate. It is said in the report that "there is as yet no perceptible improvement in the state of trade, but it would seem from the higher freights which are being obtained in the shipping trade that the reduced building is beginning to tell on the available tonnage, there being now scarcely enough to meet the demand. Until some substantial progress is made in the shipping industry, those employed in our house shops will be unable to regain their old position. The building trades would be fairly good but for the unlimited supply of men, and a revival in shipbuilding would absorb the surplus men seeking for employment in our house shops." The income for the year amounts to £5,940 12s. 10½d., or an increase of £504 7s. 11½d. over the income of the previous one. There has been paid as sick aliment, £2,530 8s. 3d.; as funeral allowance, £369; as superannuation allowance, £520 17s. 6d.; as tools compensation, £199 14s. 4d.; as strike allowance, £120; as law expenses, £23 15s. 7d.; and £100 as bonuses to two disabled members. The gross expenditure for the year is £5,438 12s. 8½d., which yields a surplus of £502 0s. 2d. on the year's transactions, and brings up the funds on hand to £8,339 6s. 8d., which, on a membership of 3,877, is £2 3s. 0½d. per member. Of this sum, £5,199 4s. 9½d. belongs to the trade fund; £3,048 7s. 9½d. to the sick fund; and £91 14s. 1d. to the idle fund—being a gain of £464 12s. 9½d. to the trade, and a loss of £54 6s. 8½d. to the sick fund, which, with the loss of £76 9s. 4d. as interest, makes a total loss on this fund of £130 16s. 0½d. The return of plant held by the Association amounts to £323 6s., making the total worth of the Association £8,662 12s. 8d. On comparing the above figures with those of last year, there is a decrease in the amount paid as sick aliment of £220 15s. 2d., a decrease of £139 7s. as funeral allowance, a decrease of £200 as bonuses to disabled members, and a decrease of £141 3s. 9½d. as tools compensation; while on the other hand there is an increase of £117 4s. as strike allowance, and an increase of £63 8s. 10d. as superannuation allowance. There is a decrease in the membership as compared with last year of 200. The arrears of trade payments amount to £238 6s. 9d., or 1s. 4¾d. per member; the sick payments to £393 14s. 5d., or nearly 2s. 2¾d. per member; and the arrears of idle payments to £14 6s. 3d., or 6¼d. per member—showing a decrease of 1¾d. on the trade payments, and an increase of 3¼d. on the sick payments, as compared with the arrears, per member of last year. This is regarded as highly satisfactory, for although the arrears of sick payments may appear to be 3¼d. per member in excess of those of last year, yet they are actually 1¾d. less in proportion to the amount contributed; the arrears of last year being 1s. 11½d. against an annual payment of 17s. 4d., while this year they are 2s. 2¾d., against an annual payment of £1 1s. 4d. The total amount levied per member during the past year was 1s. 10d., and this was exclusively for the purpose of preventing any further diminution on the capital of the sick fund until the higher rate of contributions came into operation, and was the only call which was made during the twelve months. The altered rules have been in operation for six months, and have proved an improvement on the old code.

SHORLAND'S IMPROVED MANCHESTER GRATE.

WE have always recommended the "Manchester Grate" as one of the best and cheapest contrivances of its kind. Mr. E. H. Shorland, of St. Gabriel's Works, Manchester,

and Imperial Buildings, Ludgate Circus, E.C., has, we see, recently patented an improved form of the grate specially designed to burn any description of fuel, to consume its own smoke, and to generate warm air. The grate consists of a warm air chamber placed at the back of the fire, between which and the fire is a fire tile, with openings for passage of flame and smoke. The flame and smoke pass through these openings, and down between the fire tile and the warm air chamber, then up back of warm air chamber into smoke flue, in their passage warming the air chamber and consuming the smoke. The door over fire is perforated to allow the escape of any smoke which is left. The ashpan or regulating air-box is provided with a sliding grid, which regulates the draught of the fire. This ashpan is loose, and can be removed and the ashes cleared out. Cold air is brought from the outside to the warm air chamber, and is there heated by the waste heat of the fire, and is then conveyed by pipes and delivered into same room, or any contiguous apartment. The advantages claimed for this grate are: 1. It will burn coke, anthracite, or common coal equally well. 2. Consumes its own smoke. 3. Cures smoky chimneys, by the ample supply of warm air into room, by the draughts created in the neck of chimney, and by the special construction of firebox. 4. Great economy of fuel, by making use of the spare heat, which otherwise would all pass up the chimney, and insuring by its construction more complete combustion and increased radiating powers. 5. Ventilates the room in which the fire is situated. 6. Maintains a uniform temperature in all parts of the room, and prevents draughts. 7. Warms additional room or rooms by pure warm air. We honestly think the grate does all its inventor claims for it.

REGISTRATION OF PLUMBERS.

THE good work of the registration of plumbers is proceeding, and, thanks to the Plumbers' Company—and in no small degree, as is an open secret, to its energetic and public-spirited secretary, Mr. W. R. E. Coles—the movement which we have supported from the first is now solidly established on a national basis. An interesting and useful *résumé* of the objects and methods adopted in registration has just been issued by the company, and should be obtained by every master and journeyman plumber in the country. All will see how much it is to their interest to fall in with the aims of their own guild. Nothing unreasonable is demanded. The declarations expected are of the most equitable and simple character, and the examinations to be passed such as any apprentice who has properly served his indentures can undergo. In connection with the examinations, it should be noted that in addition to the admission to registration, and in order to encourage the highest efficiency of craftsmanship, the Plumbers' Company, under special conditions, confers the Freedom of the Company on Plumbers passing their examinations with honours. This admits all who so pass to the benefits of pensions and other privileges of the Livery, and is a most wholesome return to the spirit and purpose in and for which the old City Guilds were founded. If every other Trade Guild followed the example of the Plumbers' Company, and set themselves to revive the old traditions of good work and craftsmanlike emulation, and mutual confidence and esteem between master and man, and if all this could be supplemented by the registration of architects legally empowered once again to direct the great company of workmen, we believe the present evil system of slop work and lowest prices would speedily be extinguished, and that the public would have reason to rejoice.

There is seldom a movement of this kind without more or less hindrance from separatists, who, working possibly with the best of motives, really do harm. We notice a "Society for the Registration of Scottish Plumbers" has been started at Edinburgh. Seeing that Scotland is already embraced in the Plumbers' Company's national and comprehensive scheme, we cannot recognise the need for the existence of the newer organisation. Its rules are certainly less elastic than those of the old Guild, and its objects are certainly not more comprehensive. The plumbers of Glasgow and other important Scottish towns evidently prefer the companionship of the Plumbers' Company, and so we expect will most of the others.

At a special meeting of the members of the South Staffordshire and Worcestershire Institute of Mining and Mechanical Engineers held on Thursday, it was decided to remove the home of the Institute from Dudley to the Mason College, Birmingham.

WAYSIDE NOTES.

VIENNA is not a place that I have included in my wayward wanderings; so I have read with profound humility the report of the lectures given at the last R.I.B.A. meeting, and have followed with interest the remarks of the various commentators. According to the descriptions of Mr. Thomas Blashill and Mr. F. R. Farrow, the Austrian capital, whereon the attention of the world is just now riveted, appears to be as noteworthy in its modern architecture as it is reputed to be in other ways. The gay Teutonic city is reported to possess some remarkable specimens of Neo-Greek. Mr. Blashill said that the Houses of Parliament was the only instance he knew of the successful employment of the Greek style in a large and complicated design. That is stating a great deal, and makes one long to behold the edifice in question. Doubtless the marbles rich and rare that have been employed in its construction go a long way towards making it so attractive; and I expect Mr. Blashill, in describing it as the *only* instance of the kind, intends to refer to a design with details of a purely Grecian character. Anyhow, until I have seen the Vienna Houses of Parliament, I will remain true to the Brussels *Palais de Justice*, and hold up this building to my readers as an example of the most successful attempt to produce a monumental design in a refined style of Trabeated architecture.

Some two hundred and twenty-two Private Bills have been deposited for the next session of Parliament. Two of these have been promoted with the object of obtaining powers to carry out street improvements. One of them relates to the proposed construction of three new streets, and the widening of others, in the vicinity of Kensington-square. The other was promoted last year, and seeks powers for making a new street from Whitehall to the Embankment, which is to be called Horse Guards "Avenue"—a thoroughfare designation that appears to have been much affected of late. I presume the new street is contemplated to join the Embankment with "Whitehall Yard," connecting with the former somewhere between the end of Whitehall-court and the new police offices. Whatever may be its exact position, the necessity for such a thoroughfare is not strikingly apparent—at least, until the Embankment be more lined with buildings. Perhaps it will be at no very distant date. I note that the foundations for the new police offices are being prepared on the site of the mournful old Opera House that was to have been. A pretty job it seemed, too, when I passed the works a week or so ago, the water being very troublesome here, as it is, indeed, all along the western portion of the Embankment and at Westminster. Incessant steam-pumping seems to be the order of the day in foundation work in this district.

One of the 222 Bills has been deposited by the Grand Junction Water Company, which asks for sanction to construct a new aqueduct on the shore of the Thames at Dorny, in Buckinghamshire, in connection with which the company proposes to lay down conduits and pipes for increasing our London water supply. In another Bill the United Telephone Company asks to be allowed to put up "overhead wires"—a request which the U.T.C. will probably be disappointed in, even though it seeks to approach no nearer than within twelve miles of St. Martin's-le-Grand. I observe that the South London Tramway Co. have *not* submitted their proposed Bill to enable them to construct a line of tramway along the Victoria Embankment and over Westminster Bridge. What a blessing!

I expect, Sir, that you will receive a few letters *re* the Gloucester Baths Competition, as it has resulted in the selection of a local man. But the unsuccessful competitors should remember that they have an able assessor in the person of Professor Roger Smith. The plans you promise to reproduce will prove interesting. So far as I could judge at the time, there was not over-much room on the ground for the baths, &c., that were required. The Turkish Bath itself, I should have imagined, would have taken up a lot of space, as such require considerable area if they are to be made effective in working and appearance.

The so-called Turkish Bath is an institution that has of late found increased favour in this country. It therefore behoves the architect to render himself familiar with its plan and construction. There is a considerable field for the display of ingenuity in its design, both as to construction and artistic treatment; and, although we have had many fine baths erected in London and the provinces, there are still many details that will reward study. One of the handsomest and best in London is the bath in Northumberland-avenue, where the *Tepidarium* has been rendered a thing of beauty by means of marble, faïence, mosaics, and stained glass; while in the ample *Apodyteria* the splashing waters of a little fountain soothe the erstwhile bathers. I know a good many Turkish baths, but none that are rendered so architectural as that in Northumberland-avenue. It is worth a visit of inspection.

It will not, I think, be denied that few architects are in a position to design a Turkish bath, chiefly, of course, because so few ever enter them and become acquainted with their necessities and the possible points of failure in their design. One hears of ridiculous failures in the newly-constructed baths, arising, however, solely from ignorance of their first principles, of the action of heated air, and of the means of insuring perfect ventilation, while at the same time keeping up a uniform temperature. I speak from experience—I am an old hand at taking the hot-air bath, and have long been interested in it, both from a hygienic and an architectural point of view. It is a subject that should be studied by the young architect, as it is likely in the future to frequently be included in competitions such as the late one at Gloucester. But as it is necessary, if he would penetrate the mysteries of Freemasonry or Forestry, that he should become a member of the fraternity, so if he would thoroughly understand the Turkish hot-air bath, he must become a bather, even at the risk of that awful death which, to the minds of the many, is the sure result of such a procedure. There are plenty of books and pamphlets on the theory of the hot-air bath, but a practical knowledge of their construction and arrangement can only be obtained by the study of working examples—an operation that rather taxes one's energies in temperatures ranging from 120 to 220 Fah.

The band of agitators who, a short time back, "demonstrated" before the Metropolitan Board of Works, had, it would seem, little cause for complaint against that body in respect of actual works undertaken. The rate of 8·39d. in the pound has been mainly produced by the large sum of money expended on engineering, building, and allied works. "The Board have spent no less than six millions on main drainage, two millions on embankments, nearly twelve millions on street improvements, £846,000 on minor improvements, over two millions on bridges and the Woolwich Ferry, £1,444,000 on dwellings for the industrial classes, £577,000 on parks, commons, and open spaces, £425,000 in Fire Brigade Stations, and £45,000 on undertakings to prevent floods from the Thames." As Mr. Urquhart said, this is no slight record! Neither is the 8·39d.

Commenting upon the Rev. T. G. Bonney's book on the "Abbeys and Churches of England and Wales," the last issue of the *Saturday Review* says that "The parish churches of England have undergone, during the past fifty years, a fiery trial. A few—the minority—have come out of it unscathed. The majority have been transformed, some without wholly losing their old identity, but others so that no man can say 'This is the old parish church in which my forefathers worshipped.'" The "*Saturday*," however, did not mention the extra strain of the Jubilee year, which I referred to last week. So many old buildings have of late come under my notice as worth commenting upon, that I have a whole list that it will never be possible to mention in these columns. There were some interesting facts connected with old Pentney Church in Norfolk, that Mr. E. Guy Dawber recently restored, and also some about the old Cheddar Cross in Somersetshire, that Messrs. Lingen Barker and Alfred W. Cross will shortly restore on the lines of a scheme prepared by the late William Burges, which I should have liked to have detailed. But space forbids. There is, however, one old building about to be restored that is of more than ordinary interest. Darenth Church is, I believe, now to be dealt with. "Alas! poor Darenth, I know it well!"—a simple Kentish fane in the valley of the river of a similar designation to the village. It is remarkable as possessing a very Early Norman chancel, with three tiny end windows that look like the germ of an Early English triplet. The whole valley of the river Darenth, by the bye, is most interesting. From Otford, with its castle, and church that nestles in an escarpment in the North Downs, to Dartford, on the Thames Valley marshes, there is a beautiful valley that contains many an interesting piece of old architecture. In the Devonshire-like Lullingstone Valley there are the churches of Shoreham and Eynsford, the former with a porch of solid chestnut, and the latter with a quaint shingled spire. There is Farningham with an old font, and Sutton-at-Hone with a little squared flintwork that reminds one of East Anglia; and near Darenth there is Horton-Kirby church and village. Lastly, there is old Dartford church that stands sentinel-like at the end of the valley, where, through grass-green marshlands, the river runs out to meet the waters of the Thames.

GOTH.

CHIPS.

The Corporation of Hertford is increasing the water supply of that town by sinking an 8½in. Abyssinian tube well about 100ft. deep, to draw an additional supply of about 170,000 gallons per day from the chalk springs. This work is being carried out under the supervision of Mr. W. H. Wilds, the borough surveyor, and the contract for the tube well has been given to Messrs. Le Grand and Sutcliff, of Bunhill-row.

The foundation stone of the New Junior Travellers' Club was laid on Friday with Masonic ceremonies. The new premises will occupy a commanding site in Piccadilly.

The London and North-Western Railway Company contemplate a large expenditure upon Holyhead Harbour and a considerable development of their already extensive accommodation there. Holyhead is expected to become, in North Wales, what Cardiff is in the south of the Principality.

The Glasgow Town Council have awarded the second part of the contract for the Duchray Tunnel to the contractor for the first part, Mr. Geo. Lawson, of Rutherglen, at £50,000, which was the lowest offer; and 450 tons of cast-iron pipes have been contracted for also, the lowest offer being from a Middlesborough firm at £1,972, which has been accepted.

A special meeting of the Carnarvon Town Council was held on Friday, to decide upon the site of the statue of the late Sir Hugh Owen, which is presented to the town by the subscribers. It was arranged that the statue, which is from the studio of Mr. Milo Griffith, should be erected in Castle-square, about 30 yards from the public fountain, which was opened by the Prince of Wales. It was also arranged that the pedestal, should be of Anglesey marble or Llanaelhaiarn granite.

Mr. Wm. Cairns Hardy, architect, Morpeth, died on Tuesday from an attack of rheumatic fever, at the early age of 24. Mr. Hardy was a native of this town, and was the son of the late Mr. J. R. Hardy. Some three years ago he entered into partnership with Mr. H. J. Boolds, and they together commenced the practice of their profession at Newcastle-on-Tyne, and also at Morpeth. In the latter place they eventually settled down, under the style of Boolds and Hardy. In the practice of his profession he showed energy and marked ability, and his early death is a matter of general regret.

A memorial reredos was dedicated at St. Saviour's Church, Torre, Devon, on Thursday, the 22nd inst. It is Perpendicular in style, and is made of Austrian oak. The three central panels are designed with a representation of the Crucifixion, and in the panels in the wings on either side are the Agnus Dei, and the valoring pelican. Mr. R. Medley Fulford, of Exeter, designed the reredos, which has been carried out by Mr. Harry Hems, of Exeter.

Two new board schools lately completed are about to be opened in Islington, one being situate in Pakeman-street, Hornsey-road, and the other in Blackstock-road, Finsbury Park.

NORTON CHURCH, YORKSHIRE.—HOLME WOOD, IPSWICH.—THREE HOUSES ON THE MARINA, BEXHILL.—MEASURED DRAWINGS, ROOM 4, SOUTH QUAY, GREAT YARMOUTH.—HISTORIC MONUMENTS.—THREE OLD LANCASHIRE MANSIONS.—"BUILDING NEWS" CLUB DESIGNS FOR A DETACHED VILLA RESIDENCE, TO COST £1,500.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NORTON CHURCH, YORKSHIRE.

MALTON STATION on the North-Eastern Railway, well known to all visitors to Scarborough, is really in the parish of Norton, the two places being generally known by the former name. The existing parish church of Norton immediately adjoins the railway, and is a very small, poor building in Modern Classic, much out of repair, and built in an old churchyard densely crowded with graves. It has therefore been determined to build a new church on a different site, away from the noise of the railway, and more centrally situated for the parish. Designs for a church holding 700 persons have been prepared by Mr. C. Hodgson Fowler, F.S.A., of Durham, and approved by the Archbishop and the Committee, and it is hoped that the work may be begun early in the spring.

HOLME WOOD, IPSWICH.

THIS house was built for Mr. J. E. Ransome, from designs by Mr. Brightwen Binyon, A.R.I.B.A. The plan was arranged with a view of retaining the shell of a house which was upon the site, but it was afterwards determined to pull it down in order to improve the position. The house stands upon high ground in the centre of several acres of well-wooded pleasure grounds and gardens, about a mile from the centre of the town. The view we publish to-day is from the south-east, the main garden front facing south. The building is of red brick, with Broseley tile roofs, and some half-timber work on the gables, &c. The contractors were Messrs. J. B. and F. Bennett, of Ipswich.

THREE HOUSES, MARINA, BEXHILL.

THIS drawing illustrates three houses now in course of erection at Bexhill, and are the first that have been erected on the Marina facing the sea; the plan has been arranged for three complete houses. The internal structural details are being carried out with the view that when required the three houses will be easily convertible to a private hotel, containing 60 apartments, including coffee and billiard rooms, with their accessories. The whole of the fronts will be cemented, the mouldings, cornices, and window dressings being formed of the same material; Portland cement being found the most favourable medium for withstanding for any lengthened period the ravages of wind and weather on the south coast. Mr. J. B. Wall, of Walbrook and Bexhill, is the architect, and is also surveyor to the estate. The builder is Mr. James Cole, of Western-road, Bexhill.

OLD PLASTER CEILING, SOUTH QUAY, YARMOUTH.

THIS plan, illustrating the beautiful ceiling in No. 4, South Quay, Yarmouth, forms one of the series of drawings for which the Queen's prize was recently awarded to Mr. Charles John Brooke, of Southtown, in connection with the Science and Art Department. We hope, at an early date, to publish some of the other sheets from the same set, giving details of the screen and woodwork. The house from which this ceiling was taken is thus described in Manship's History of Great Yarmouth, published in 1819:—"The residence of Chas. John Palmer, Esq., F.S.A. It was built in 1596 by Benjamin Cowper, a wealthy merchant of Yarmouth, and Burgess in Parliament for the town. The front has been modernised, but it contains a room on the first floor 30ft. long by 18ft. wide, elaborately adorned with carvings of great beauty and elegance, which remain in the most perfect state. The dining and other rooms are also panelled and ornamented with carvings." Although the date of this publication is some time back, the state in which they are at the present time, Mr. Brooke writes, fully justify the above remarks.

HISTORIC MONUMENTS.

WE heartily welcome the book of ancient examples just published by Messrs. Brindley and Weatherley,* giving illustrations of over 600 specimens from various countries, and from the earliest periods down to the end of the last century. The selection seems to have been limited rather by the idea of representing mainly only such monuments as are likely to afford types of design or suggestive models for modern uses; so that many grand and otherwise remarkable instances, both in England and from the Continent, are omitted, such as the Tomb of Aylmer de Valence and Henry VII. Tomb in Westminster Abbey, or the Cardinals d'Amboise monument from the Lady Chapel of Rouen Cathedral, not to name other numerous specimens of large size and magnificence like the Scaligeri Tombs at Verona, or that of St. Chiara at Naples. To the antiquary the plates afford a singularly continuous chapter of historical instances chronologically grouped with descriptive indices. The drawings are enhanced in usefulness by being mostly drawn to a uniform scale of one inch to the foot, thereby rendering the comparison of various designs much easier. No work on this subject, so complete is this one, can be expected to include more representatives of every style and design which have marked its history; but if we may point to an omission, it is to refer to the unique terracotta monument at Layer Marney in Essex, and similar work in the chancel of Wymondham in Norfolk, both of which illustrate a particularly refined class of detail admirably adapted for present uses, and not too big in scale. The samples, which, by the courtesy of the authors, we have been allowed to group together in our double-page plate to-day, distinctly show the wide range of subjects brought together, however, in the volume before us. The earliest example, though the smallest, is one of the most interesting shown on our plate. It represents a rich cross from the centre of a stone altar top of the 7th century preserved in the library at Valogues, La Manche, France. The other four incised crosses on the same slab are smaller, and inclosed in circles. The beautiful body of a sarcophagus of white Greek marble, from the museum at Arles, figures to the left of the last-named subject, and is drawn to inch scale. The ends of the sarcophagus are quite plain, and measure 2ft. 7½in. wide. The coped lid is gone. The arrangement of trees forming niches for the full-length statues grouped along the front is very ingenious in design, and if we remember rightly, was skilfully adapted by the late Wm. Burges in the drawing-room chimney piece for his house at Melbury-road, Kensington, introducing the beautiful garden dreamt of by Gillaume de Louis, the hero of Chaucer's Version of "Roman de la Rose." Between the trees are figures of Largesse, Richesse, Joliveté, Liesce, Beauté, and others, with names in Provençale. In the example at Arles birds are grouped in the foliage. The pre-eminently Celtic treatment of the Kildalton cross delineated to the right of our page is at once to be noted. The divergent spirals growing as it were from the massive bosses which serve as jewels in the design, produce a fine ornament. The principal group on the other side of this cross represents the "Virgin and Child," a subject which appears on the St. Martin's Cross, Iona, and on the slab at Crail. These crosses are unique in character, and are possessed of great interest as works of early art, which, with their decay, will become extinct. The section shows the sinking of the interwoven pattern to the circle round the head of the cross. Our last specimen is of comparatively recent date, and is entirely different in every way, while some purists may consider it unworthy of publication—at least, as an example to be imitated. No one would probably advocate the reproduction of composition curtains and the conical, testerlike top which surmounts the design; but like many another piquant and clever monument of the same date (1635), it is unquestionably possessed of a quaintness and breadth, coupled with a recognition of sculpture which is worthy of imitation. The monument is in alabaster and black marble. It was originally highly elaborated with gold and colours, and these have lately been restored by Mr. G. F. Bodley, A.R.A., who renovated the church a few years ago. Its position is on the north side of the chancel in Kinnersley Church, situated some eight miles from Hereford. At the end of the volume, we may add, are some useful alphabets of various dates. The plates, which measure 15in. by 10in., are all executed in chalk lithography.

* Ancient Sepulchral Monuments. By WILLIAM BRINDLEY and W. SAMUEL WEATHERLEY, F.R.I.B.A. London: 20, Cockspur-street, S.W. Published by the authors. Printed by Messrs. Vincent Brooks, Day, and Sons. 1887.

THREE OLD LANCASHIRE HALLS.

BRADSHAW HALL is, perhaps, one of the least known of the many old houses near Bolton-le-Moors, and so far as we are aware, has not been illustrated before. No mention is made of the building in "Parker's Domestic Architecture," and the history of the place appears to be devoid of any special points of interest. The mansion was built by the Bradshaws, then owners of Marple Hall in Cheshire, one of the most beautiful Elizabethan houses in that county. Judge John Bradshaw was the president of the court that tried Charles I. This regicide, of yeoman origin, was born in a farmhouse at Wybersley, and was related to John Milton, to whom he bequeathed £10. Clarendon describes him as "not without parts, but of great insolence and ambition." Bradshaw Hall was a 17th-century house; but it has been very much altered since its more palmy days. The Jacobean front seen in our view is, however, very quaint and interesting, having a porch of some dignity, enriched by engaged columns surmounted by a broken entablature, and finished with sugarloaf terminals of odd design. These are somewhat coarse and meaningless; but the mouldings of the arch and the details of the Order are refined and effective. In general idea the porch is similar to that of Hall-i'-th'-Wood, illustrated on the same sheet of drawings, both houses, perhaps, being the work of the same architect. No records remain to tell of an eventful history, for the story of the Cromptons' home at Hall-i'-th'-Wood is unmarked by any particulars of moment, and the building, like many another old English house, depends upon its own style and features for the evidence of its history. The earlier half of the house to the right of the entrance is entirely of timber and plaster, built possibly towards the close of the 15th century. Over the porch are carved the letters "A. A. N.," said to be the initials of Alexander Norris, who is believed to have built the stone south front of the house, dating his work 1648. There is a very good oak staircase in the house, of Jacobean workmanship; but otherwise there are not many remains of interest within the building. Mr. R. Knill Freeman, the architect, is, we understand, about to carry out some improvements here. A plan of the place, together with other views and details of the woodwork, will be found in the BUILDING NEWS for Nov. 9, 1877. Handforth Hall, not far from Manchester, is near Wilmslow, on the borders of the county, the station of Handforth being well known in connection with Norcliffe Hall, on the banks of the Bollin, as a favourite Cheshire rendezvous for picnics. The grounds at Norcliffe are very beautifully laid out, and are exceedingly well situated. Handforth Hall evidently has seen better days, but now is shorn of much which once gave the house a charm. The timbers, which are filled

in with brickwork, are very simply framed, save in the gables (seen in the sketch), but here much of the detail has gone. The composition is boldly treated, and the first-floor rooms were of unusually lofty proportions considering its date. The work in some other respects resembles the earlier wing of Hall-i'-th'-Wood already mentioned.

COMPRESSIVE STRENGTH OF STEEL.

AN elaborate investigation into the relation which compressive strength of steel bears to tensile strength is the subject of a paper read before the American Society of Civil Engineers by Mr. Charles A. Marshall, C.E. Solid rolled bars from the rolls were the samples tested. The general law demonstrated by these tests is thus given : "That the elastic limit of the material is the chief factor in determining the ultimate resistance of struts of ordinary length made out of wrought iron or steel, excepting the very hardest kind ; and that the two quantities' elastic limit in compression and ultimate compressive strength are identical within a considerable range of length-ratio of columns." The tables and diagrams given by Mr. Marshall are interesting and corroboratory of this general law. No less than 74 flat-ended compression tests of 28 different sizes of bars, ·44 to 6·0 square inches section, all from same blow of Bessemer steel, and of lengths 2, 12, 18, 24, and 30 times the shortest diameter, are recorded in the first table. Table 2 exhibits average results of full-size tensile tests of the twenty-eight different bars above named. No less than fourteen tables of compression and tensile tests of steel bars of different manufacture and sizes are given. The tests were chiefly made in the laboratory of the Cambria Iron Company, Johnstown, Pa., and the machines used are detailed by the author, who describes also the mode adopted. The author refers to two phenomena exhibited on the diagrams. 1st, When a load equal to the elastic limit of any of these materials is imposed and allowed to remain for some time, it causes permanent change of length, amounting, it is believed, to much more than has been generally understood, and which is apparently a very definite quantity for each case. 2nd, This change of length having begun under a load equal to elastic limit, will continue under a less load. It was shown that in cases of the 100,000lb. steel, the 67,000lb. steel, and the hard iron made from scrap, that the total is obtained equally as well, though requiring greater time, with a load of 1,000 or 500lb. less than primitive elastic limit, as with a load equal to it. The amount of stretch at elastic limit, as taken from the diagrams, show—

For the	100,000lb. steel	0·3	per cent.
„	80,000lb. „	1·4	„
„	67,000lb. „	1·85	„
For hard iron	„	1·3	„
For soft iron.....	„	2·3	„

It is said the specimens under compression reach their maximum change of length under constant load in less time than those under tension, thought to be due to the more rapid action. We cannot here follow the author's minute particulars of these experiments. The tables show that crippling strength does not bear any definite ratio to ultimate tensile strength, and they appear to establish the law that the crippling strength of steel in the form of moderately long struts is approximately equal to the elastic limits. The greatest differences are small when compared to the agreement of the quantities registered. Another fact worthy of notice is that a bar very seldom exhibits a higher resistance than this limit when 12 diameters long or over. In those cases where the law is not evident, the bars had some defect, or the stress was not true to the section.

Other facts deduced from the rules are that the elastic limit varies more with size of bar than does any other property of the metal, and the thicker the bar the lower is the elastic limits and ultimate strength. The same law applies to iron, though the exceptions are more numerous, owing probably to the defects in the material. The steel from which these tests were made was very uniform, as proved by the small variation in ultimate strength, though the thickness of sections were widely different. Diagrams showing the range of elastic limit in compression, and the curve of resistance, according to Euler's formula, are instructive. From the author's experiments, the engineer will be safe in taking the elastic limit in compression and ultimate strength as the same within a considerable range of length ratio of columns. The author shows that while this law is true as to strength, where Euler's curve crosses the line of elastic limit it falls off immediately, and therefore for pin-ended columns the length ratio at which elastic limit ceases to be the measure of the column, strength varies with the limit, and is determined by plotting the intersection of Euler's curve and a horizontal line representing the elastic limit.

THE ARCHITECTS', CIVIL ENGINEERS', AND SURVEYORS' BILL.

WE have been requested by Mr. Edgar Farman, the hon. secretary to the Architects' and Engineers' Registration Act Committee, to publish the following list of gentlemen who have consented to act as local hon. secretaries to, and been appointed by, the committee, with the object of making known the motive and scope in all parts of the United Kingdom of the proposed Architects', Civil Engineers', and Surveyors' Act, and to facilitate the passing of the Bill. The principal duties of gentlemen appointed as local hon. secretaries will be to seek interviews with Members of Parliament for their several districts, with a view to obtain their support and votes, as well as to invite signatures to the petitions that will be presented in support of the Bill.

The Bill will be presented to the House of Commons by Colonel Duncan, R.A., C.B., M.P., at an early date after the opening of the coming Session ; it is, therefore, requested that gentlemen willing to serve as local hon. secretaries in towns not already provided for, as shown by the following list, will kindly send in their names to Mr. Edgar Farman, 39, King-street, Cheapside, E.C.

LOCAL HON. SECS. TO A. AND E. REG. ACT COMMITTEE.

Ashton-under-Lyne, E. Garside ; Aberdeen, James Souttar ; Armagh, J. Fullerton, A.R.I.B.A.; Brighton, E. J. Hamilton, M.S.A.; Banff, N.B , G. W. Cosser, M.S.A.; Banbury, E. W. Mills ; Bristol, J. H. Jones; Bradford-on-Avon, C. S. Adye, M.S.A.; Blackburn, J. H. Stones, M.S.A.; Barnsley, B. Turner; Bury St. Edmunds, J. Rodwell, A.M.I.C.E.; Bangor, J. P. Mumford; Burton-on-Trent, R. Carpenter; Brighouse, J. Lord, jun.; Bath, Major Davis, City Architect; Birmingham, W. F. Cross, M.S.A., and E. Mansell, M.S.A.; Belfast, W. F. Fennell, M.R.I.A.I.; Cheltenham, A. E. Pearson, M.S.A.; Cardiff, E. Seward, A.R.I.B.A.; Cork, F. McMullen, Sec. South of Ireland Society of Architects; Carnarvon and Conway, J. P. Mumford ; Dublin, W. Stirling, F.R.I.A.I.; Dundee, J. M. Robertson ; Denbigh, R. Lloyd Williams, A.R.I.B.A.; Elgin, C. Doig; Exeter, O. Ralling, M.S.A.; Ennis, W. Carroll, jun ; Enniskillen, T. Elliott; Edinburgh, R. Cameron; Gloucester, J. F. Trew, M.S.A.; Godalming, S. Welman, M.S.A.; Hull, W. A. Gelder, A.R.I.B.A.; Hastings, F. Burr, M.S.A. ; Hereford, J. Parker, City Surveyor ; Holyhead, J. P. Mumford ; Jersey, Adolph Curry, M.S.A. ; Kidderminster, J. Mossop, A.R.I.B.A. ; Leamington, F. Foster ; Liverpool, J. Price, A.M.I.C.E.; Limerick, M. A. Hennessay ; Llandebie, D. Jenkins ; Londonderry, W. Harte ; Llandudno and Menai Bridge, J P. Mumford ; Norwich, A. Lacey, M.S.A.; Newcastle-on-Tyne, J. M. Rich, sec. Northern Architectural Association ; Newmarket, P. Holland ; Penzance, O. Caldwell, M.S.A.; Portmadoc and Pwllheli, J. Mumford ; Redruth, James Hicks, M.S.A.; Ryde, J. Salter, jun., M.S.A.; South Shields, H. Metcalf, M.S.A.; Southsea, C. W. Bevis, M.S.A.; Southampton, E. Evans, M.S.A. ; Swindon, W. Drew ; Stafford, N. Joyce, A.R.I.B.A ; Shrewsbury, A. E. Oswell; Sunderland, T. Milburn, A.R.I.B.A.; Torquay, G. S. Bridgman, C.E, M.S.A.; Truro, S. Trevail, M.S.A.; Taunton, G. Strawbridge; Weymouth, R. C. Bennett, C.E, M.S.A.; Wrexham, J. E. Lash; Walsall, H. Lavender, M.S.A.; Weston-super-Mare, A. W. Cross ; Wakefield, F. Simpson ; Wolverhampton, M. Johnson ; York, W. Hepper, President York Architectural Association.

Gentlemen in the following places have offered to act, and will come before the Committee for election at the next meeting :—Nottingham, Newport, Mon., Rochdale, Canterbury, Yeadon, near Leeds, Westgate-on-Sea.

At the Ashton-under-Lyne County Court on Dec. 22, Thomas Bevan, a bricklayer, recovered £100 under the Employers' Liability Act from Messrs. J. H. Gartside and Co., Limited, of Buckton Vale, Ashton. The plaintiff was seriously hurt through the collapsing of a building which he was assisting to unslate, and it was alleged on his behalf that the manager had ordered the men to proceed with the work after a "cracking noise" had been heard, telling them that the roof would not go down.

Building Intelligence.

JOHNSTONE, N.B. — The new Municipal Buildings, Johnstone, N.B., were opened on Wednesday last. The accommodation consists of a court hall and magistrates' rooms, police cells and official rooms, such as charge room and captain's room, a superintendent's house, besides fire-engine and ambulance sheds, mortuary, tool house, &c. The total cost, exclusive of site, is about £2,000. The building is executed of light-coloured freestone from Falla-hill Quarry, from designs by Mr. C. Davidson, architect, Paisley, and is an expressive treatment of the Scotch Baronial style.

PRESTON.—The Bishop of Manchester consecrated on Friday additional burial ground and the new Church of St. Andrew, at Longton, near Preston. The church has been erected at a cost of nearly £4,500. It is in the Gothic style, and has been built from the designs of Messrs. J. E. K. and J. P. Cutts, London, by Mr. John Fecitt, of Blackburn. The building at present consists of nave, chancel, north and south aisles, organ chamber, and vestry. A north-west tower is provided for, and a parish room is to be added to the vestry. The pulpit, reading desk, font, and mural tables have all been removed from the old chapel into the new building, and a parishioner has presented a lectern. In the north aisle has been placed the stained east window from the old chapel, now about to be demolished.

STREATHAM, S.W.—The corner-stone of a public hall for Streatham was laid on the 19th inst. by Mr. Henry Kimber, M.P. The building, which is already considerably advanced, and will be finished by next March, is situate in the Gleneagle-road, close by Streatham Station. The exterior is of red brick and rough-cast, with carved and moulded enrichments to the entrances, windows, &c., and the hall will be roofed-in with green slates and surmounted by a ventilating cupola. The large hall, which will contain a stage, will be 80ft. long by 45ft. wide, and is calculated to seat 800 persons. Two smaller halls will also be provided, and will have stage platforms. In addition to these there will be rooms for Masonic lodges, political meetings, musical and other societies. The construction will be fireproof. The total cost, together with the freehold site, will be about £10,000. The architect is Mr. W. T. Hollands, F.R.I.B.A., of 27, Chancery-lane, W.C., and the contractors are Messrs. A. M. Deacon and Co., of Norwood.

SOUTHWELL. — It is announced that the Archbishop of Canterbury will reopen Southwell Cathedral on February 2, after its restoration from plans and designs by Mr. Ewan Christian, as architect to the Ecclesiastical Commissioners. The ancient roofs of the Minster were destroyed by fire in 1711, and were replaced by flimsy slate. The building had lost much in appearance by this change, and by the removal, at the beginning of this century, of the lead-covered spires which previously terminated the western towers, and also by the destruction of the conical roof of the chapter. The roof of nave and transepts have been reconstructed on the old lines, and that of the chapter-house and the western spires have also been reproduced, the latter being designed after comparison of all the old prints, drawings, and documents relating to the building, so as to follow as closely as possible the old outlines. The new roofs and spires have been executed in English oak and covered throughout with cast lead on a double thickness of boarding ; the western spires are each 150ft. high from ground to capstone, of which the towers contribute 98ft. The central tower, which remains untouched, is 106ft. high to parapet, and 115ft. to top of pinnacles. The new roof to nave and transepts are open to the rafters, the old ones having been flat ceiled. We illustrated Mr. Christian's works of restoration by double-page photolithographs in our issues of Dec. 23, 1881 and Jan. 13, 1882, and a series of four views of the unrestored Minster appeared in our issue of March 3, 1882. The choir screen was shown by measured drawings (by Mr. H. Hardie Kemp) March 30, 1883, and (by Mr. H. C. Pigg), Feb. 25, 1887 ; a section

of old nave roof Sept. 19, 1879, and the exterior of chapter house, sketched by Mr. H. Harrington, Oct. 19, 1883; 14th-century foliage carving from drawings by T. F. Pennington, Dec. 21, 1877.

Engineering Notes.

FOUNDATIONS.—At the fortnightly meeting of the East of Scotland Engineering Association, held on Friday night in the Oddfellows' Hall, Edinburgh, Mr. J. H. Anderson read the first portion of a paper on "Foundations." After stating the pressures to which different soils, from rock to silt, should be subjected, the methods usually adopted by engineers to obtain satisfactory foundations in different strata were explained. In peaty ground works were often and successfully founded by digging holes through the peat and filling these in with sand—a method which had been adopted on several German railways. The various methods of using piles were next considered. In certain cases, he contended, it was advisable to use cast or wrought-iron columns, which might be driven in the same manner as timber, or screwed into the ground by means of levers. The various forms of screws, depending on the nature of the soil, were detailed; Mr. Brunlees's process of inserting piles by means of a jet of water was explained. This process worked very well in sand, but in clay or stony ground gave trouble in sinking.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

CHESTER ARCHÆOLOGICAL SOCIETY.—At the last meeting of this Society, held in the Grosvenor Museum, the Ven. Archdeacon Barber in the chair, Mr. W. Thompson Watkin, of Liverpool, gave an account of the Roman inscribed stones recently found in the City Walls. The lecturer gave a graphic description in detail of all the inscribed stones, some 18 in number, lately unearthed in the course of the repair of the north side of the City Walls, near the Phœnix Tower. A discussion, taken part in by Rev. G. Preston, Mr. E. W. Cox, Mr. G. W. Shrubsole, &c., followed the lecture, and a vote of thanks was passed to Mr. Thompson Watkin, on the proposition of the chairman, seconded by Mr. Percy Wyndham.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of this Association in the Architectural Hall, 42, George-street, on Dec. 21st, Mr. Patrick Geddes read a paper on "Architecture and Decoration in their Social and Economic Aspects." Mr. Hippolyte J. Blanc, the president, was in the chair. Mr. Geddes pointed out that the importance of architecture from an economic point of view was far greater than was usually admitted by economists, since the architect not only directed the highest form of production and consumption of wealth, but at once exhibited the division and organisation of labour in a way far more developed than that of the lower industries, and was concerned always with the accumulation of the social inheritance, and never with that of mere social debt, which was so often expressed in money. Passing to history, the conditions of rise and decay of the great styles of architecture were outlined both from the particular standpoint of each age and in terms of the constant relation of thought and action; and the rise of each style was shown to depend on the proportion in which art was popular and social—in fact, adapted to the wants of the mass of the people. The means at present beginning to be employed for the improvement of housing and decoration for the people were briefly alluded to, and the lecturer closed by urging that the bettering of the housing of the poorer quarters of the Old Town of Edinburgh, and the decoration of its public halls, would afford a means of technical education for younger architects unsurpassed by all the present resources of teaching and examination boards. On the motion of Mr. W. D. M'Kay, R.S.A., seconded by Mr. D. M. Westland, C.E., Mr. Geddes was heartily thanked for his paper.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.—The annual meeting of this Royal Institute was held in their rooms, 37, Dawson-street, Dublin, last week. Mr. Thos. Drew presided. The hon. secretary (Mr. Albert E. Murray) read the annual report, which reviewed the work of the Institute during the year. They had to record with regret the death of two of their life members—Mr. W. H. Thomson, of Belfast, and Mr. Henry Hill, Cork. The council had acted very successfully as a Board of Arbitration, and if its services in that capacity were more frequently availed of as between architects and clients, much costly litigation might be prevented. The question of architectural federation was making steady progress, and last year a Bill was printed and circulated called "The Architects and Engineers' Registration Bill," the object of the measure being that after its passing architects should be obliged to undergo an examination before entering the profession. Mr. J. L. Robinson, A.R.H.A., of Dublin, in moving the adoption of the report, said that no doubt there were a great many people who were not properly qualified at present practising as architects, which was a great grievance to the regular members of the profession. He criticised the action of the Office of Works in furnishing plans for nothing in the case of many buildings, to the detriment of the profession. The Chairman remarked that these plans were frequently totally unsuited to the sites and requirements. Mr. J. R. Carroll, of Dublin, seconded the motion, and the report was adopted. A communication was received from the committee of the Technical Schools, and it was resolved that a donation of three guineas should be made to them on behalf of the Institution. The Chairman advocated that some step should be taken to ascertain the statutory powers of the Corporation to interfere with new buildings. The following gentlemen were elected on the council for 1888:—Messrs. Albert E. Murray, Sandham Symes, J. J. O'Callaghan, J. R. Carroll, George C. Ashlin, Thomas Drew, Charles Geoghegan, James H. Owen, William Mitchell, Thomas Deane, and J. L. Robinson. Messrs. J. H. Fullerton, Armagh, and R. Langishee, Athlone, were elected Fellows. Messrs. J. H. Pentland and T. N. Deane were reappointed auditors. Mr. S. Symes was presented with an illuminated address on the part of the Institute in recognition of his services as hon. treasurer. The annual dinner was afterwards held at the Grosvenor Hotel.

CHIPS.

Mr. G. F. Watts, R.A., has presented his great picture "Love and Death" to the Whitworth Committee at Manchester, which has been formed to carry out a proposed gift of a public park and museum of arts by the trustees of the late Sir. J. Whitworth. The artist had lately declined an offer of £3,000 for the work to become the property of the city.

A new mansion, to be known as Beechy Lees, has just been completed at Otford, near Sevenoaks, from the designs of Messrs. Roger Smith and Gale, of Wellington-street, Strand. Mr. A. Bush, of London, was the general contractor, and Mr. James Redden is the clerk of works. The terracotta has been supplied by Messrs. Doulton and Sons; the enriched ceilings have been executed by Messrs. Jackson and Sons; and the mosaic paving by Messrs. Burke and Co.; and the stable fittings are by Messrs. Musgrave and Co.

The north aisle and clerestories of St. Peter's Church, Great Berkhampstead, have just been restored as a memorial to the late Mr. T. Curtis, of Berkhampstead Hall, by his heir.

The tenants' memorial to the late Earl and Countess Dalhousie will assume a twofold character, viz.:—First, an erection of a monumental character in the Edzell district, on a site to be afterwards selected; and second, a stained-glass memorial window in St. Andrew's Episcopal Church, Brechin.

The Corporation of Sheffield are now building an additional smallpox hospital in an isolated spot at Lodge Moor, on the west side of the town, and a Local Government inquiry was held by Mr. J. T. Harrison, an inspector of the Local Government Board, on Thursday, with respect to their proposal to borrow £12,500 for the purpose.

The parish church of South Lynn, Norfolk, has been reopened after internal restoration, including the reseating of the nave with oak benches, and of the chancel with choir stalls.

The memorial stones of new Church of England Schools were laid at Pannal, near Harrogate, on the 22nd inst. Mr. Dickinson, of Harrogate, is the builder.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., and XII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—W. Co.—J. G. M. and Co.—J. W. and Co.—W. T. N.

LIGHT. (Hayward Bros. and Eckstein are the firm for anything of that kind. The other things you speak of are no use.)—CHAS. F. MOXON. (We do not wish to interfere with the good work our contemporary is doing for the Registration Bill. Such remarks as those you allude to are really doing more to commend it to all right-minded architects than all our very insignificant efforts.)

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Boreas," "Mayfly," "H.M.S. Conway," "Herz," "Elean," 'Frost," "Angle," "Samivel," "Exonia," 'Pedro," "Lawton," "Student," "Mancunium," "Dutch Clinker," "Jack," "Vis-a-Vis," "Penarth," "Glen Coe," "Lancashire Lad," "Recruit," "Sapphire," "Celt," "'Arry," "Pecksniff," "Hernani," "W. H. L." in circle, "Texas Bill," "Simplex et Prudens," "Transome," 'Aughrim," "Design," "Mumps," "Gilbert," "Leodiensie," "Janitor," "Towser."

Correspondence.

REGISTRATION.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Jackson's paper at the A. A. is meant to excite discussion on the question of the proposed registration of architects, and I beg to offer a few remarks which my foreign experiences suggest to me.

To begin with, if, as Mr. Jackson puts it, on the authority of Mr. Spiers, English architects are superior to the Continental ones, the question may be considered as closed. We need not try to alter what has given such splendid results. I should rest satisfied if I did not remark that our superiority is claimed solely by ourselves. Of course, every race of men have a right to consider itself as the standard of perfection, and the Negro woman is quite justified in airing her superiority in beauty over the Venus of Milo. The only point which we have a right to ask from everybody is "consistency." I often hear English architects disparaging Continental architecture as tame, hard, cast-iron, monotonous, and I take the liberty of asking them why they go into en-

thusiastic admiration over the temples of Greece, which are more monotonous in their design, and more rigid in their details, than any modern building in France or Germany?

Some of Mr. Spiers' affirmations on the subject of the relative merits of English *versus* French architecture seem to me questionable, even from the basis of reason common to English and French alike. The mere imitation of past works of art has never been considered as a very meritorious achievement, and when Mr. Spiers speaks of our healthy ecclesiastical architecture, I am tempted to ask: Where are the English buildings in which modern aspirations and modern constructive progress are embodied? Now, if I turn to Paris, I find, in the Eglise de la Trinité, a building perfectly original, perfectly modern in character and its means of construction. As to whether the character be more or less ecclesiastical than other churches, that is a question for priests to solve. It is a question which differs with every country, and with every sect; the Japanese are, no doubt, more religiously impressed by the aspect of their timber temples than by our Westminster Abbey.

In discussing all questions relative to architectural education we should, I believe, make a wide difference between private and public buildings. The principles of design which govern these two departments of architecture not only differ, but are antagonistic. A private dwelling reflects the requirements and tastes of an individual: its architecture should be so supple as to bend itself to every caprice, not only of the present owner, but also of the future owners. In fact, its composition should be so loose, that any amount of alterations and additions may be made to it without offending the eye. However complex the plan of a private house may be, the dwellers are so intimately acquainted with it that it will never be objectionable. Public buildings, on the other hand, reflect the requirements of communities, and their dispositions must be clear and systematic to facilitate their being used by everybody. In England architects have numerous opportunities of getting experience in private architecture; but they have very little opportunity of getting experience in the designing of public buildings, and therefore I conclude that in the interest of the public it would be well to have a school to prepare architects for designing and carrying out our public buildings.

If the registration of architects were limited to recognising the proficiency of architects who compete for public buildings and for public appointments, there would be no particle of objection to the scheme. Architects of public buildings are public servants for the time being, and the Government has an undisputed right to gauge the proficiency of its servants before it employs them. But if registration is, as proposed, to comprise all architects, it would be an interference with the liberty of private individuals unknown in any other country of Europe.

Instead of registration, what is wanted is a clear definition of the responsibilities of architects. If an Act of Parliament be passed, enacting "That for every new structure or structural alteration a plan and specification signed by a responsible person shall be deposited, and that the signer of the plans and specifications shall be for ten years responsible for all structural defects which may occur, and will have to make them good at his own expense," all the advantages which are sought from registration will be obtained, and architectural students will think it worth their while to learn construction as well as sketching.—I am, &c.,

Lawrence Harvey.

THE REGISTRATION BILL.

Sir,—How will the proposed Registration Act apply to architects now in practice who have commenced since 1882, but who have been properly articled to established men, say, before 1870? Are they subject to any examination? If so, it seems very unfair that men who, until a short while before 1882 were only clerks of works, but who are now practising as architects, should be free from interference, when men who have paid premiums and given years to qualify, find themselves outdone because they did not start practice by or before 1882.—I am, &c.,

Perplexed.

PERSPECTIVE.

Sir,—Mr. "M." leaves entirely out of consideration the perspective of the picture surface itself, whether it be a "plane" or the "*plane*" which, according to his idea, "ought to be a curve." I suppose he means that the perspective should be projected upon a portion of a vertical cylinder, the centre of the base of which should be the station point. There is no difficulty in this; but it would carry out his idea completely if the projection were made on the inner surface of the portion of a sphere, the centre of which should be the station point, as is done in some panoramas (or is "dioramas" the proper word?). But then in all three cases, whether the picture surface be plane, curved, or spherical, the picture must be viewed in that form and from the exact point of sight; otherwise great distortion must occur. You distort your plane picture by curving it when looking at it, and your curved pictures by laying them flat for view. In either plane or curved picture a correctly-projected globe will appear as an ellipsoid in the perspective, which the picture itself forms when viewed from the wrong point, unless a line from the centre of the globe to the eye be at right angles to the picture plane. On the curved picture which "M," advocates, the globes level with the eye will appear properly as circles; but when the picture is viewed from a distance too great, although but slight, then the circles become elliptical. Again, a globe at the side of a plane picture, projected correctly thereon, will appear as a circle when viewed from the right point; if it were drawn as a circle it would appear to the eye as an ellipse when viewed from the right position. All this can be proved by a few simple experiments with the pencil.

If "M.," having drawn his curved picture, will take the trouble to project a perspective of the picture itself on a *plane* in front of it, he will find himself compelled to project his *circular* globes as ellipses. Or, *per contra*, having correctly projected on a plane a globe as an ellipse, he can then project the plane picture on his favourite "curved plane," placed in front of the plane picture with the station point of the latter as the centre of his curve, when he will be able to project the elliptically-drawn globe on his curved picture as a circle, much to his satisfaction; but by this means he will prove no more than that the circle is the proper projection on the curved picture, and the ellipse the correct drawing on the flat drawing.

Notwithstanding, where globes must be at the sides of my picture, I should draw them, similarly as "M." would, as circles, but not for the same reason;—not because that would be the *right* projection, but for the reason that the picture would always be viewed from the *wrong* position and distance. But I would also take care to have no globular form of great magnitude except at, or near, a position equidistant from the sides, as the "cooking" or "fudging" the proper ellipsoidal projection into a circular form would cause an effect of "out-of-drawing," viewed from any position. With globular forms of minor magnitude the defect is not so striking, but even in these cases an awkwardness is to be detected in the delineation from many points of view, when the objects are drawn as circles.—I am, &c.,

R. W.

Sir,—"M.'s" letter is surely misleading. Ordinary linear perspective, which applies only to drawings done on a flat surface using a picture *plane*, has one fault, and one only—viz., it supposes the observer to use but one eye. This fault is of little consequence in life-sized pictures, but in small-scale drawings it becomes important, and the more so the nearer the E.P. is to the picture plane. But, in the worst cases, a perfect representation can always be obtained by the inconvenient method of closing one eye and placing the other in a correct position. Of course, "Perspective" does not propose to make a picture look correct unless viewed from the exact E.P. The E.P. is often placed too near the picture plane, widening the angle of vision, and where it is seldom found by anyone viewing the picture. This, however, gives a drawing not wrong, but inconvenient to view correctly, and the fault lies not in the rules but in the draughtsman.

To take "M.'s" example—viz., a sphere in perspective. Suppose a number of spheres be hung up, and a *plane* of glass be placed between them and the eye. If the outlines of these spheres be traced on the glass, moving the eye, but keeping the head in the same position, we obtain a perfect but correct-looking representation on the glass of the spheres beyond it. Now, only a sphere exactly in the line of sight will be traced a circle; all the rest will be traced ellipses, the more eccentric the further they are from the C.V., whose major axes produced pass through the C.V., but each will appear from the E.P. an exact circle. If, however, all were drawn in their respective positions exact circles, they would appear to the eye, still kept at the E.P., ellipses whose minor axes produced pass through the C.V.

Of course, each of the visual rays could (not should) cut the picture plane at right angles, but the picture *plane* would have to be abandoned for a surface of double (not single) curvature—viz., a hollow sphere struck from the E.P. In such case the picture itself would have to be a similar hollow sphere, as are some panoramas, and then, and then only, would it be and look correct to represent all spheres by circles.

E.P. eye-point, vertically above the station point.

C.V. centre of vision, the point found on the picture plane by dropping a perpendicular on to it from the E.P.

Line of Sight: the above-named perpendicular produced.—I am, &c.,

Lancashire. Delta.

"THE AGE OF ELM JOINERY."

Sir,—Mr. W. Dart (of Crediton's) remark that the framework of the old doors at Exeter's Guildhall is of elm, has, I believe, always been a universally acknowledged fact. He asks whether any other samples of elm joinery over 200 years old are known. There are innumerable specimens of elaborately carved linen chests in existence in the West Country, most of them dating from an earlier period than this. At the celebrated sale of the eccentric late Mr. Bethel Walrond's collection at Dulford House, near Cullompton, in September, 1878, over 100 of these ancient coffers were sold. All were of Jacobean date, and more than two-thirds of them were made of elm.—I am, &c.,

Exeter, Dec. 24. H. H. R.

CHIPS.

The Hackney District Board of Works has borrowed £10,000 for the purpose of the Clissold Park Acquisition Act. The South Hornsey Local Board have decided to contribute by means of a loan £6,000 towards the balance required to make up the purchase-money of the park as a recreation-ground.

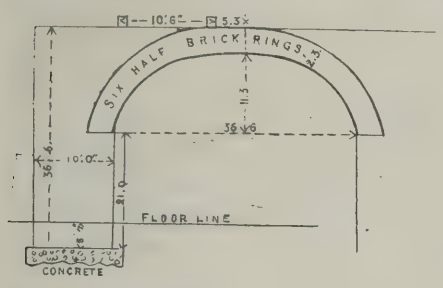
The death is announced of Mr. John Willacy, who for the last fourteen years has held the appointment of town surveyor, for Weston-super-Mare.

A stained-glass light in the east window of St. Michael's Church, Malton, was unveiled on Christmas Day. The window has been supplied by Messrs. Heaton, Butler, and Bayne, of London. The subject is the "Crucifixion."

A medallion portrait of the late Sir E. C. Kerrison, Bart., has this week been placed in the dining hall of the Albert College, Framlingham, Suffolk, of which the deceased was one of the founders, and the first vice-president. The sculptor is Signor Giuntani, of London.

The South Parade and Holme Hill Schools, Grimsby, have recently been enlarged for the Grimsby School Board, providing extra accommodation for 148 children. Mr. E. W. Farebrother, F.R.I.B.A., was the architect, and Mr. T. Simmson, the contractor.

The committee of the Edinburgh Town Council who have charge of the memorial to the late Sir William Chambers have decided that the memorial should take the shape of a colossal statue in bronze, ten feet high, on a suitable stone pedestal, and the amount which it is contemplated spending on it is about £1,000. The committee will throw the competition for the statue open to sculptors both in England and Scotland.



A new three-light stained-glass window, executed by Messrs. Hardman and Co., of London, has just been placed in the parish church of West Knighton, near Dorchester, by the officers of the Duke of Cambridge's Own (Middlesex) Regiment, in recognition of the gallantry displayed by Lieutenant W. P. Cockeram, who was killed in action in Burmah.

Intercommunication.

QUESTIONS.

[9515.]—**Valuations.**—Will "G. H. G." or some other experienced reader, give me examples of—1. How to estimate the value of a 75 years' renewable (on payment of fine) leasehold property, 47 years expired, gross annual rent £120, ground rent £10 (renewal fine as per table on lease 4½ years' purchase)? 2. How to estimate the value of the reversion, supposing the lessor wanted to sell his interests in the property? 3. If the above was held on a 99 years terminable lease, how would you estimate the value?—YOUNG SURVEYOR.

[9516.]—**Stability of Arch.**—Would some scientific reader of this column give me the working out of the stability of the three-centred arch given below? Thickness

of arch and abuttal, 1ft. 10½in.; materials, brickwork in mortar; tie-beams rest on the wall above the arch at the points shown; that nearest the centre carries 3 tons, the other 2 tons. Wanted to know the safe load at the points where the tie-beams rest, and if the arch and pier are in a state of stability? Can the brick rings be regarded as voussoirs? The working out is particularly desired.—VERNIER.

REPLIES.

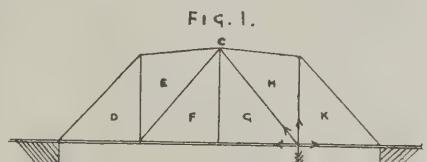
[9480.]—**Masonry.**—I am surprised at Mr. Powell not seeing the close connection there is between my question and his own. An arch-stone is evidently the stone of an arch, and, therefore, to be able to define any stone as an arch-stone, you must first be able to define the structure to which it belongs as an arch. The proper answer to my question would have been to have quoted some work on Masonry or Architecture where a cupola was defined as a spherical arch. But to cut the matter short, I may tell Mr. Powell that amongst architects the word "voussoir" is used. Apart from the quotations I have already made from Gwilt's "Encyclopædia" and Dobson's "Treatise of Masonry," I may add that I have heard my friend, Mr. Charles Barry, use that word repeatedly. On the other hand, by questioning the practical masons who attend my class, I find that practical masons do not know the term "voussoir"; but to their answer they added the following rider: "What we want is to learn how to make the moulds for stone-cutting and how to apply them, and this we get from you to our complete satisfaction. As to the expressions you use, they are of no consequence, as we understand very well what you mean." I hope Mr. Powell and those practical masons who are interested in this most useful of all sciences to them, will take heart by the opinion so clearly expressed by their brother masons who follow my lessons. They will see that far from asking them to go up a precipitous staircase, as Mr. Powell expresses it, I lead my pupils along a very easy inclined road. The class for practical masons will begin on the 10th of January, when I hope to meet Mr. Powell and many other intelligent practical men like himself.—LAWRENCE HARVEY, Architect, Teacher of the Class of Masonry, City and Guilds of London Institute.

[9482.]—**Products of Gas Combustion.**—To satisfactorily answer "R.'s" query of last week, it would be necessary to make a careful analysis of the result from the combustion of both flames separately. Never having had an opportunity of doing so, or seeing the result of any such analysis, I am not in a position to speak with any certainty. I have only detected the peculiar smell mentioned by "R." when the flame has been burning in contact with asbestos, and never in the laboratory, where there has been several "Bunsen" flames going at the same time. From this I infer that the smell arises rather from the asbestos than from the flame itself. The only other way I see of accounting for it is that it might be due to certain impurities in the gas, which only give rise to the peculiar smell under the action of the Bunsen flame.—SCIENCE.

[9484.]—**Chesterfield Spire.** — Perhaps a few further particulars relative to this spire may be worth space in this column. It was under the shadow of Chesterfield's spire that Harrison Ainsworth wrote his well-known novel, "Rookwood," in 1831. The author refers to it therein as a "queer, twisted steeple, which, like the uplifted tail of the renowned Dragon of Wantley—to whom houses and churches were as capons and turkeys—seems to menace the good town of Chesterfield with destruction." One writer says, in Ford's history—"That he minutely examined it, and found one of the four upright beams drawn out of its tenon, and shrunk several inches." Another authority says—"Some years ago, to place its crookedness beyond a doubt, the situation of the base was subjected to a careful measurement, when it was found to deviate from the perpendicular 6ft. towards the south, and 4ft. 4in. towards the west, giving its greatest angle of inclination somewhere near to the south-west angle." Early this century the Rev. G. Hall wrote—"It is built of wood and covered by lead, and no doubt was once straight and perpendicular; but the sun, at the time its power is strongest—*i.e.*, between one and two o'clock—has shrunk the wood, and warped the spire in the direction it now appears." In the beginning of this century the following letter (still preserved) was addressed to the vicar and churchwardens:—"Sheffield, Dec. 20, 1827. Gentlemen,—Agreeable to the request of Mr. Bainbridge, I attended on Monday, the 19th of December, instant, to inspect the steeple of your church, and am quite of opinion that it is unsafe and dangerous to remain in its present state; for, on inspection, I found the old timber much decayed, and the construction of the whole so imperfect that it would be impossible to repair it, even at any expense, so as to insure its standing many years, being extremely weakened by its being so much out of plumb to the south, from the tower to its centre, and to the west from its centre upwards. I should, therefore, recommend that the steeple be taken down to prevent the possibility of an accident, the event of which would inevitably do considerable damage to the roof and body of the church, and erect on the tower, which is strong and sufficient, a stone steeple.—I am, Gentlemen, your most obedient servant, E. W. DRURY." The town, however, soon got up in arms, horrified at the bare thought of losing their quaint specimen of architectural eccentricity, and the steeple was spared. John Mannings, who posed as a bit of a poet, idealised the whole thing after the fashion of poets, and wrote:—

> "Whichever way you turn your eye,
> It always seems to be awry:
> Pray can you tell me the reason why?
> The only reason known of weight,
> Is that the thing was never straight.
> Nor know the people where to go,
> To find the man to make it so;
> Since none can furnish such a plan,
> Except a perfect upright man.
>
> So that the spire, 'tis very plain,
> For ages crooked must remain;
> And while it stands must ever be,
> An emblem of deformity."

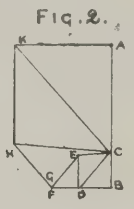
In 1869, during some violent gales, a large portion of the lead was blown off. It is variously stated to be 230ft. and 250ft. high. In Dickens's days, a riddle was propounded in *Punch*—"Why is Chesterfield Church steeple like one of Charles Dickens's best novels? Because it is all-of-a-twist! ('Oliver Twist')."—HARRY HEMS.



[9490.]—**Measurement of Shafts.**—"G. H. G." should remember "If the blind lead the blind they fall into the ditch." His reply is very rule-of-thumb. Why should brickwork be paid for that has not been done, and that has no relation as to actual cost to what was done? Of course, unless there are special circumstances, what was not done should not be paid for, and anything extra that was done should be measured and paid for at its own value, not by an extra price on the quantity of brickwork that may be more or less, so that "G. H. G." misses with both barrels, although he is seldom as Byron wrote—

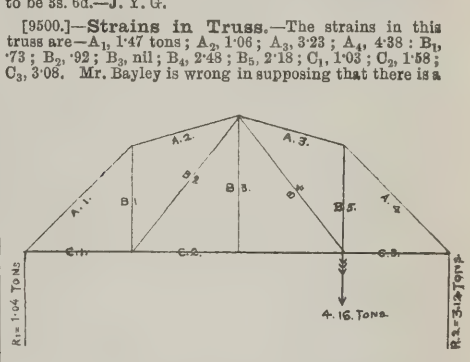
> "Dogs blink the covey, flints refuse the spark,
> And double barrels, d—— them, miss the mark."

The fact is, the query did not give proper information for a precise reply. It is to be presumed that a flue was intended, and, if so, was it specified and shown, and of what size, and was it deducted in the quantities?—and what was done should be followed, right or wrong. If, as appears likely from the query, all was done as intended and specified except that no extra was allowed for extra labour on brickwork of shafts, and if the contractor knew what he was tendering for, he is entitled to no extra. What was done in the quantities or detailed estimate should be followed as to measurement and price, if remeasured at all.—M. M.



[9500.]—**Strains in Truss.**—First draw the truss representing all the applied loads including reactions (as shown in Fig. 1). This we call the Frame Figure. 2nd.

Fig. 1.



On each side of the line of action of any force, place a letter, according to "Bow's" system of notation, and in doing so it will be found convenient to travel always in one direction, e.g., always with or against the hands of a watch. In my diagram I have moved round the figure with the hands of a watch, thus A B represents the applied load, then B C and C A, still moving in the same direction, represents the forces at the left and right hand abutments respectively, and A B, B C, and C A represent in the present case all the external faces; but in addition to these we have the force actions in the members of the truss, and these again will be represented by the same method of notation by placing a letter on each side of each member; therefore we have the further continuation of the lettering by moving still with the hands of a watch, and in the spaces between the members placing D, E, F, G, H, K, all as shown. Now, to draw the stress diagram (Fig. 2) on any scale, draw $a\,b$ parallel to A B (Fig. 1), and measure this on any scale so as to represent the magnitude of A B, in the present case 1·16 tons. Thus $a\,b$ is downwards, and $b\,c + c\,a$ are equal to $a\,b$; but act upwards. Further $b\,c = \frac{3}{4}$, and $c\,a = \frac{2}{3}$ of $a\,b$, as will be seen from diagram, Fig. 1. Now, turning our attention to left-hand abutment for instance, we have three forces, B C (the reaction), C D (the stress in the upper boom), and B D (the stress in the lower boom), all acting through one point and in equilibrium; therefore by triangle of forces any triangle drawn so as to have its sides parallel respectively to B C, C D, and D B will have its sides proportional to these forces. Thus in Fig. 2 (our stress diagram) we have $b\,c$ parallel and equal to B C; therefore from b and c respectively draw $b\,d$, $c\,d$ parallel to B D, C D (Fig. 1), and $b\,c\,d$ is the triangle of forces for the joint on left-hand wall. Next, if we pass to the first bottom joint from left-hand wall the solution is impossible, because there we have three unknown forces, and solution at any one point is only possible where we have not more than two unknown. Pass on, then, to the first joint on the upper boom, and we have three forces, C E, E D, and D C acting on a point, and again in equilibrium, and again for these the triangle of forces can be drawn. Further, since we have just found $c\,d$ (Fig. 2), the stress in C D (Fig. 1), there only remains for us to find the stresses in C D, D E. Now, $c\,d$ (Fig. 2) is parallel and equal to C D (Fig. 1);

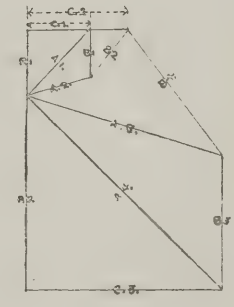


Fig. 2.

therefore from c and d draw $c\,e$ and $d\,e$ respectively parallel to C E and D E (Fig. 1). $c\,e$ represents the stress in C E, and $d\,e$ the stress in D E. At the first lower joint from the left we have now only two unknown, viz., $e\,f$ and $f\,b$, which may be drawn as before, parallel to E F and F B, and so on for the remaining joints. If Edward Bayley will be at the trouble to draw the figure as I have indicated, he will find that f and g coincide in Fig. 2, the physical interpretation of which is that the stress in the middle vertical member vanishes, or is zero under the given load, and therefore in the present instance F G is a superfluous member. Now, to find the kind of stress in each member, say, we take the joint where the weight is supported, Fig. 1, and move round it in the order in which we lettered the members. In passing round from B we come successively to G, H, K, A and back to B. Now, in passing from B to G (Fig. 1), look at Fig. 2 and see how we travel in order to reach g from b, and it will be found that we go from right to left; hence the stress in B G is away from the joint. In passing from G to H look again at Fig. 2; and in passing from g to h it will be seen we go up and again away from the joint. And so for H K it will again be seen we go away from the joint, so that all the members meeting at this joint are really in tension, and the compressive strain which Edward Bayley thinks is evidently acting in this member is all imagination. The determination of stress diagrams for all kinds of roof and bridge trusses, bending moments, and shearing stress in loaded beams, &c, will be found very carefully set forth in a textbook specially prepared for students, engineers, and architects, and to be issued about Christmas by Collins and Co., London and Glasgow, the price of which is only to be 3s. 6d.—J. Y. G.

[9500.]—**Strains in Truss.**—The strains in this truss are—A_1, 1·47 tons; A_2, 1·06; A_3, 3·23; A_4, 4·38; B_1, ·73; B_2, ·92; B_3, nil; B_4, 2·48; B_5, 2·18; C_1, 1·03; C_2, 1·58; C_3, 3·08. Mr. Bayley is wrong in supposing that there is a

compression strain on B_5 (the member that corresponds to A in his sketch). The thick lines in the diagram are in compression, and the thin lines in tension. B_3 is a superfluous member.—A. G. B.

[9502.]—**Sapwood.**—Under certain circumstances, it is difficult to distinguish sap and heartwood in Baltic yellow fir. If the tree is felled in the winter and converted in the following summer, the sapwood will be of the same pale straw colour as the heartwood, whether the log be floated or not; but upon exposure to the weather, in the process of seasoning, the heartwood assumes a reddish tint, and, as a natural consequence, the two classes of wood are clearly distinguishable. If the wood has been floated, it becomes kind and mellow, as a great part of the natural oils or secretionary matter in newly-felled wood is dissolved. If unfloated, the sap, from its marked whiteness, and from its habit of exuding resinous matter, is very distinguishable. In this state the wood is strong and hard. Discoloured sapwood, that is sapwood ranging from a light to a deep blue or black, is, unfortunately, too clearly distinguishable. This condition is brought about by the logs being too long in the water, or from the wood getting damp and being placed in a confined atmosphere, such as the hold of a ship. It is the result of the fermentation of the albuminoids, or soluble vegetable matter

of which the cells and tissue of the sapwood are so largely formed. This fermentation develops a low form of fungoid growth, varying in intensity until the point of dry-rot or utter dissolution is reached. Its existence depends upon moisture and a high temperature, and hence, except in a confined atmosphere, where its growth, associated with decomposition, engenders heat, it is only active in the summer-time. Baulk timber is invariably kept afloat, although it makes the wood tender and leads to its early dissolution, for the reason that in this state it is more readily and cheaply handled. This system of floating is more popular in London and on the East Coast than it is in Liverpool and on the west coast, where it is invariably landed and piled under travelling cranes. The objection to this latter system is that it is difficult to handle the timber and to obtain special lengths and sizes from a cargo, and, further, that it depreciates in value in the summer season, from external shakes, the result of drying in the bulk. If the sapwood is blue or discoloured, its presence and its junction with the heartwood may be easily traced; but it is not safe to say that it is bounded by a particular ring, for, although the wood is deposited in rings, the process of hearting is not so defined. The deposition of heartwood is often erratic, and instances are found where the process is more advanced on one side, or in one part of the tree, than in another. Wood undergoes the process of hearting, when, by the annual addition of sap rings, it becomes buried in the woody stem of the tree to a greater depth than is required for the ascending sap or life-blood of the tree. The inner cells of the sapwood, as they thus fall out of use, become receptacles for the lodgment of secretionary matter peculiar to the tree. This matter in the fir tree, from being resinous, insoluble in winter, and offering ill food and lodgment for parasitic vegetation, converts the imperfect porous and perishable sapwood into compact and durable heartwood. The question of shreds of sapwood being allowed on converted timbers is a point no writer in these columns can decide. Sap is present in all imported woods; but it is a common thing for architects to rule it out in the framing of their specifications, and it is common for this ruling to be read with a qualification, for a deal of sapwood in practice passes into consumption. Were this not the case, we might be afflicted with a famine in wood. "R." may take it that sapwood, with the exception of that associated with a few tropical woods, is softer than heartwood, and that the softness increases with discoloration until the point of dissolution is arrived at. Discoloured sapwood, if in a wet state, will improve or assume a lighter colour by drying; but when once turned blue, it can never be made to assume its original whiteness. Sapwood in felled timber will remain sapwood until the end of the chapter, for the process of hearting, which is beyond the influence of man, ceases with the felling of the tree and the removal of the bark. —Wm. Stevenson, The Park, Scarborough.

[9505.]—**Frost and Selenitic Mortar.**—In the old-fashioned times we discontinued building our brickwork in the winter; but now we are obliged to build all the year round, taking the chance of Jack Frost tripping us up. I have lately had a considerable quantity of brickwork destroyed, which was built with selenised lias lime, the lime bought already selenised, and ground and afterwards made up by me by grinding in a mill. I should be glad to have the opinion of some of your experienced readers as to what kind of mortar it is best to use in face of the risk of frost attacking the work before it is thoroughly set. I am not having in mind so much a light frost, which merely affects the outer part of the joints, but a frost which freezes the heart of the work and disintegrates the mortar. It would appear that although Portland cement, from its rapid set, would often resist a frost which would affect lime mortar; yet when once the partial set of Portland cement is disturbed, it will not again unite, but remain permanently in a pulverulent condition. I should like to know whether the selenised lime mortars would act similarly in this respect to Portland cement. They have a rapid partial set; but, for a considerable time after, the mortars made from them contain much free water, which the frost would expand, and so pulverise the mortar. Will it again set after this? And if so, which lime is best in this respect —selenised lias or selenised Dorking? Would Dorking lime not selenised and used hot be better than either of the selenised limes on account of the heat developed in slaking? And would the mortar thus made again set to any extent after having been once expanded by frost? It appears to me that it would; as mortar made in this, the ordinary way, can be heaped and kept for considerable times, and although it gets hard and stiff, can be beaten up and used, and is, in fact, the better for having been kept. This does not apply to Portland cement or selenised limes, which must be used on the day on which they are made up.—W.

[9506.]—**Hydraulics.**—Presuming that the piece of oak "Buoyant" mentions is seasoned and not fresh filled, it would of its own weight displace in fresh water 1,604 cubic inches; or supposing the piece to float on edge, it would be submerged 13·374in. A weight of 20·024lb. would cause the log to sink until the top edge was level with the surface of the water. These are obtained as follows:—

30in. × 18in. × 4in. = 2,160 cubic inches volume of piece of oak.

·743 = specific gravity of seasoned oak.

252·5gr. = weight of a cubic inch of water (distilled).

1 − ·743 = ·257 = difference between the specific gravity of water and that of the oak.

2160 × ·743 = 1604·88 cubic inches. Mass of water displaced.

18in. × ·743 = 13·374in. Depth piece would sink of its own gravity.

$$\frac{\cdot 257 \times 252{\cdot}5 \times 2{,}160}{7{,}000} = 20{\cdot}024\text{lb.}$$, or weight that would hold the piece of oak in equilibrium floating with its top edge level with the surface of water; anything beyond this would tend to sink it. The depth of water has nothing to do with its buoyant property.—Hydrostatique.

[9509.]—**Plugging Wall.**—Cut a hole of dovetail section 3 or 4in. deep, then a block of wood a little less in size, same shape, so as to leave a space round the block. Rinse the hole out, bed and fix wood in with good plaster or cement and clean sand, then tighten while soft with thin roofing slate, the wood to be put sideways of the grain, not endways, or screws will not hold in. Another way is to cut out a half or whole brick, inserting a dry wooden brick. Tighten round with iron or slate wedges. —Jas. Pulham.

[9509.]—**Plugging Wall.**—Let "Woodrose" have a plug made of dry wood by chopping a piece off the edge farthest from the workman, then turn it round and do the same to the other side, thus making a twist in it. Let the thickness be nearly equal, and not taper. If this is driven into a mortice properly made, no power can withdraw it. The farther it is driven the tighter it will be. Oak or other hard wood is best where screws are used.—William Peachey.

[9513.]—**Damp-Courses and Concrete over Site.**—I know damp-proof courses are necessary wherever there is at any time an excess of water which falls near the walls, which is absorbed according to the nature of the materials, especially of brick. Every healthy dwelling-house should have a stratum of damp-proof concrete over all the surface of ground, especially of basements, except built on solid impervious rock high and dry. It is a pity, or worse, to endeavour to evade such a good by-law, though some concrete I have seen put in, just for sake of complying with the law, by some cheap house-builders, is of but little good, not being of close texture and impervious, as intended.—Jas. Pulham.

CHIPS.

A remarkable man died at his residence, at Barnard Castle, on Sunday night, in the person of Mr. William Smith, who had attained the age of 75 years. In early life the deceased had a blacksmith and shoeing forge in an obscure part of the town. The need for the introduction of sanitary machines being suggested to Mr. Smith by the Rev. W. F. Wharton, at that time rector of Barningham, plans and models of street-sweeping machines and road-scrapers were quickly made by him. The original mechanism of the invention was rapidly improved upon and patented, and a world-wide sale was commanded. Mr. Smith quickly amassed a fortune. He has left a large grown-up family.

The laying of the new water supply mains to Merthyr Tydvil from the reservoirs at Cwmdaff, Brecknockshire, a distance of 31 miles, has just been completed. The work has been two years in progress, and has cost, for material and labour, about £150,000. It is part of the great scheme now being carried out by the borough of Cardiff, and will, when the Cantreff reservoir is completed, form a high-level service for Cardiff, Llandaff, Penarth, and Whitchurch.

On Saturday morning the premises of Mr. Henry Morris, joiner and builder, Birmingham-street, Dudley, were partly destroyed by fire. The damages amount to about £1,000.

A spire has just been added to St. James's Church, Thornton, near Leeds, an edifice built in 1872 on the site of an old chapel-of-ease, from designs by Messrs. T. H. and F. Healey.

Mr. Edward A. R. Innes, resident engineer at Port Natal, died at Pietermaritzburg on the 16th inst., aged 35 years.

Mr. William James Beadel, M.P., the President of the Surveyors' Institution, has been appointed a deputy lieutenant for the county of Essex.

The partnership hitherto existing between F. Esam and J. J. Muller, of Bexhill, Essex, architects and estate agents, has been dissolved.

Mr. Harry Hems gave his 21st Christmas dinner to the aged poor of Exeter on Monday, when sixty men and women, whose ages ranged between 60 and 90, sat down to a bountiful spread in the large wood-carving room at the "Luckie Horseshoe," and after dinner an address was given by the Bishop of Exeter.

An application has been made by the Market Harborough Local Board to the Local Government Board for powers to borrow £22,000 for the purpose of waterworks for the board's district. Major Tulloch held an inquiry on Tuesday week. The application was opposed by the Union Canal Company and the Rugby Local Board. The inspector undertook to lay the objections before the Local Government Board.

A new Gothic church at Eppleton, dedicated to All Saints, has just been consecrated by the Bishop of Durham. The church has cost nearly £4,000.

The Jubilee Committee at Westbury-on-Trym have provided a new clock in the church tower at a cost of about £225. The clock takes the place of one which had indicated the time for upwards of a century; and it has three dials. Moreover, the quarters will be chimed and the hours struck. The makers are Messrs. William Potts and Sons, of Leeds, from the designs and plans of Lord Grimthorpe. The clock was set going on Thursday, the 22nd Dec. Messrs. Potts and Sons were the makers of the clock recently erected at Stoke Bishop Church.

A large mission hall, class-rooms, and gymnasium, and four shops, covering a large area of ground, are being erected at New Clee, for the Rev. H. Hutchinson, from designs of Mr. E. W. Farebrother, F.R.I.B.A., architect, Grimsby. Mr. Fred Grant, of Cleethorpes, is the builder.

Our Office Table.

Mr. David Maclaren, architect to the Dundee School Board, died at his residence, West Park-road, Dundee, on Wednesday week, at the age of 39 years. He was a native of Dundee, where he received his first professional training in the office of his uncle, Mr. James Maclaren, architect. Subsequently he entered the office of Mr. Maclure, Glasgow, where he obtained valuable experience in the erection of schools, an impetus having been given to such work about that time by the formation of School Boards in Scotland. The Dundee School Board advertised for competitive plans for new schools, and Mr. Maclaren's plans were accepted. He was subsequently appointed architect to the Dundee School Baard, and entered into partnership with the late Mr. James Ireland. Mr. Maclaren was recognised as one of the ablest School Board architects in Scotland, and his plans of schools were so highly appreciated by the Education Department that they were cited as models to other Boards. In addition to the public schools, many large buildings, such as the Sailors' Home, University College, and the Harris Academy, were erected from his plans.

We were glad to notice that among the awards at the recent Adelaide International Jubilee Exhibition was one of the highest class, the "first order of merit," to Mr. Robert W. Edis, F.S.A., F.R.I.B.A., of Fitzroy-square, N.W., for his drawings of the Constitutional Club in Northumberland-avenue, London, and of restorations and additions to Bishop's Palace at Buckden. We understand that the recipients of the first order of merit will receive a diploma and medal in March next.

The time for depositing Private Bills which will be brought before Parliament next Session having expired, it is ascertained that no fewer than 215 will be proceeded with, being an increase of 22 as compared with the number deposited last year. Of these an unusually large proportion relate to London and the Metropolis, for 43 are Bills that either entirely or in part have reference to schemes in and around London. The scheme for an Outer Circle Railway, promoted in 1882, and since abandoned, is revived; the line will run from Ealing to Tottenham, forming junctions with all the railways running north and west of the metropolis at the termini, and at Kingsbury, Hendon, and Edmonton. The London, Chatham, and Dover Railway Co. seeks to extend the Blackheath Hill branch from the termination of the extension now in progress between Blackheath Hill and Greenwich to Charlton. A branch line from Wimbledon to Sutton, *viâ* Carshalton and Cheam, is in contemplation. The chief works proposed by the Metropolitan Board of Works' Bills are a deviation in the line of the Blackheath tunnel and the formation of a recreation-ground at Ladywell, Lewisham. The City Corporation seek powers to enable the City coroner to hold inquests upon the occurrences of fires. For proposed tramway extensions eight Bills have been deposited. The companies who are seeking extensions of their present systems are the North London, the London, Camberwell, and Dulwich, the London Street, the Harrow-road and Paddington, and the London Tramways Companies. A new company, under the title of the South-East Metropolitan Tramways, seeks power to construct a line from Lewisham to Greenwich.

Several discoveries of interest have lately been made in the excavations at Pompeii. Many silver vessels and three books were found in a house in the 8th district under circumstances suggesting that their owner, a lady named Dicidia Margaris, had packed them and died before she could remove them. Her name we learn from the books, documents, and title-deeds. These are the usual wood tablets, 8in. by 5in., coated with wax, and several of them are fastened together in book form. For the first few days after their discovery they were perfectly legible, except where damp had destroyed the wood; after that time the layers of wax peeled partly off, splitting up into small portions. The contracts all refer to slave-dealing transactions, and were made in the year 61 A.D. The silver plate formed a set for four persons, but is incomplete. It com

prises four goblets with four trays, four cups with handles, four smaller cups, four others, four cups with feet, a cup without a handle, a filter, a small bottle with perforated bottom, a spoon, and a small scoop. The total weight of the articles is nearly 127oz. troy. There was also found a silver statuette of Jupiter on a bronze pedestal, as well as a bronze dish with raised edge and inlaid with a silver plate, and three pair of ear pendants. Among other recent discoveries at the Pompeii excavations are numerous surgical instruments, mostly of bronze, also a small pair of apothecary's scales and a set of weights; a stew-pan of bronze with silver inlay, glass vessels, terra-cottas, gold rings, and ear pendants.

A COMBINED level and rule has been patented by Messrs. Wickham and Roach, of Burnside, Connecticut. The block constituting the main body of the level has at one end a tube bent to the form of an arc and ten degrees larger than a quadrant, being divided into degrees from 0° to 90°. In the back of the block is a groove adapted to receive a folding rule, there being also a recess in the groove to hold a screw-pointed pin for fastening the level to a tree or post by passing the pin through a hole in the block. A longitidunal bore, parallel with the bottom of the block, has crossed wires in each end, and is intended for use in sighting, and to the face of the block is secured a plate, giving the scale of perpendicular of any angle up to 60°. The rule is formed in two sections, connected by a pivot-pin, one face of the rule being divided into inches, while the other is marked with angle lines, so arranged that when any two lines formed upon the two-rule sections are brought together in a straight line, the numbers placed in connection with the meeting lines will indicate the angle at which the true lengths of the rule are extended. The free ends of the rule sections are pointed, so that the rule may be used as dividers.

FOR some time private excavations have been made intermittently in Cyprus, which have yielded interesting results. These have now been prohibited by the authorities, with the result that the matter has been taken up by the Society for the Promotion of Hellenic Studies. This association has opened a Cyprus Exploration Fund, and a committee has been appointed, which includes amongst its members Mr. Sidney Colvin, Professor Jebb, Professor Sayce, and Sir Frederic Leighton. The society contributes £150, and the same sum is presented by the British School at Athens, whose director, Mr. Edward Gardner, will direct the explorations. The best of the "finds" will go to the British Museum and the Universities of Oxford and Cambridge. It is hoped that the authorities will approve of excavations conducted by this organisation; but their sanction has not yet been obtained.

MESSRS. BURT AND POTTS have just issued their 1888 catalogue of wrought-iron casements and frames, about which we can only say much the same as we have done before—that it is one of the few really indispensable to the architect, who goes as a matter of course to Burt and Potts for metal casements and frames, and knows he is absolutely safe in their hands. The manuscript list of testimonials from leading architects accompanying the catalogue is one any firm might be proud of. The majority have been given during the present year, and the well-satisfied tone of the writers, including such men as Messrs. Bodley and Garner, Ewan Christian, John Douglas, Goldie, Child, and Goldie, R. W. Edis, C. J. Ferguson, T. G. Jackson, Paley and Austin, W. H. Seth-Smith, V.P.S.A., A. Waterhouse, and many other well-known architects, abundantly guarantees a large accession of fresh patronage for Messrs. Burt and Potts during 1888.

A MICHIGAN inventor, Mr. Joseph Hambitzer, of Houghton, has devised a form of sash support and lock in which a plate, having two oppositely-inclined surfaces, is secured to the window casing adjacent to the sash and adapted to receive a roller between either of its inclines and the sash to support and lock the latter in position. A thick, flat plate is held by screws against the inner face of the casing, adjacent to the fall of the sash—the inner edge, near the top of the plate, being inclined downwards towards the sash, and its inner edge near the bottom being inclined away from the sash. A roller is suspended from a cord attached to the plate, so that when the roller is removed from its seat, it will leave both hands of the operator at liberty for adjusting the sash; but by placing the roller against either of the inclines, the sash will be firmly supported and locked in the ordinary way against an upward movement by placing the roller at the top, and against a downward movement by placing it at the bottom.

LEGAL INTELLIGENCE.

THE POWER OF CORPORATIONS TO REJECT PLANS CONFORMING TO THEIR BY-LAWS.—This point is proposed to be raised in the case of Veitch *v.* the Mayor and Corporation of Newcastle-on-Tyne. In the Queen's Bench Division, on Dec. 21, before Mr. Justice Wills and Mr. Justice Hawkins, sitting as a divisional court, Mr. J. L. Walton moved *ex parte* for a rule directing a writ of mandamus to issue to the mayor, aldermen, and burgesses of the city of Newcastle-on-Tyne, and also to the members of the improvement committee of that city. The applicant, Mr. Veitch, proposed to build some houses within the limits of the city of Newcastle, and, in conformity with the by-laws, he submitted plans for the consideration of the improvement committee. These plans were disapproved, and Mr. Veitch then waited upon the committee and asked them upon what grounds the plans had been disapproved. The committee declined to state the reason, and he then asked if the plans were or were not in conformity with the by-laws, and if they were rejected on the ground that they did not conform to the by-laws. The chairman of the committee said "You must ask the town clerk," and the town clerk, who was present, then said the by-laws had been complied with, and that was not the reason for which the plans had been disapproved. The applicant then submitted that the committee had no power to reject the plans if they were in accordance with the by-laws, but the committee declined to discuss the question with him, saying their disapproval was final. The plans were then withdrawn and again submitted to an architect, and, with his assistance, some slight deviation from one of the by-laws was removed, so as to make them absolutely in every respect in accordance with the by-laws. Thus altered, the plans were again submitted to the improvement committee, and again rejected on the 19th October. After the election of members of the corporation then pending, again Mr. Veitch waited on the committee, who still declined to approve the plans, and the position Mr. Veitch was in was this: that he could not build without being liable to penalties. Mr. Justice Wills: Yes, if he violates the by-laws he may have his buildings pulled down and be liable for penalties. I suppose the committee have a right to reject the plans for nonconformity with the by-laws. Mr. Walten: Yes; but they admit that our plans are in conformity with the by-laws. Mr. Justice Wills: You have said enough to entitle you to your rule.

WALLEN V. DICKINSON.—In this case the plaintiffs sought compensation for the non-fulfilment by Mr. Dickinson, builder, of an agreement in respect of the lease of a portion of land at Poplar. The extent of the land was 92,175ft. gross, and 79,715ft. net. Mr. Dickinson agreed to expend £25,000 in building upon the land within 18 months. This he failed to do, and it was put forward that the Board of Works had refused to sanction his plans, and in consequence he found it impossible to go on with the building. On behalf of the claimants, Mr. Edward I'Anson gave an estimate of £5,070, and Mr. F. Wallen, one of the claiming trustees, surveyor, valued the compensation due at £6,606. On the other side Mr. W. Rex thought no more than £10,000 or £15,000 could be expended with profit on the land. The case was referred to Mr. W. J. Beadel, M.P., for decision, and he has given an award for £2,475.

THE ACTION AGAINST THE FORTH BRIDGE CONTRACTORS.—The First Division of the Court of Session at Edinburgh gave judgment on the 21st Dec., in a reclaiming note from a judgment, by Lord Trayner, in an action by the Steel Company of Scotland, Glasgow, against Tancred, Arrol, and Co., contractors, Forth Bridge Works, for £100,000 for breach of contract, in respect that the defenders had bound themselves to take from the pursuers the whole of the steel required in the construction of the Forth Bridge, and the defenders had been supplying themselves elsewhere with steel. The defenders held that the question fell to be decided by arbitration; that the defenders were not entitled to take from the pursuers more than 30,000 tons; and, further, that according to the custom and practice of the iron and steel trade in Glasgow, the expression 30,000 tons more or less, mentioned in the contract, did not cover more than five per cent. variation on either side of that amount. Lord Trayner, in the Outer House, repelled the plea of arbitration, and allowed proof on the other parts of the case. On a reclaiming note, the First Division adhered to the Lord Ordinary's interlocutor, except so far as allowing a proof regarding the custom of trade was concerned. The Court accordingly repelled the pleas of arbitration and the custom of trade, and remitted the case back to the Lord Ordinary to take proof on the rest of the case.

THE LAYING OUT OF PRIVATE STREETS.—By the direction of the Local Government Board, Major-General E. Phipps Carey held an inquiry on Friday, at Liverpool, into an appeal by a number of property owners and builders against the decision of the Toxteth Local Board with regard to the sums alleged to be due to the board from the owners for private street improvements. Mr. Layton, in stating the case for the appellants, said that Messrs. Coltart owned some land in Toxteth-park, which in 1882 they laid out and sold for building purposes. Plans were submitted to the board and approved, having been previously inspected by Mr. Hall, the surveyor to the Toxteth Local Board. Unfortunately, Mr. Hall died in 1884. The board now denied that the streets were constructed under Mr. Hall's supervision, and with his approval. It would, however, be shown that Mr. Hall gave instructions to the contractor who did the work, and specifications of the work and a description of the materials to be used were sent in. Mr. Shand said the board had never received such specifications. Mr. Layton said he would prove that the specifications had been sent in. He pointed out that the board had adopted private streets constructed on similar specifications. Mr. Hall was succeeded in office by Mr. Price, who demanded that a number of alterations should be made in the sewering and flagging at the expense of the owners, and while he required the owners to make the flags of a certain size, he approved and used smaller flags himself. Some of the flags rejected by the surveyor had been bought by owners, sold at a profit, laid in Liverpool streets, and afterwards approved by the Liverpool Corporation. He considered the interference of the board was arbitary and uncalled for. Evidence was called in support of the appellants' case, and to show that the flagging in the streets in dispute was of a character which in no way called for the interference of the board. Mr. Robert Wylie, architect and surveyor, Liverpool, said that in 1886 he examined one of the streets, Greenleaf-street, and found that the flagging done by the owners was quite good enough for any street. There was no ground for interference by the local authority. At this point the inquiry was adjourned till January 6th.

IN RE ALBERT TAYLOR.—(Sittings in Bankruptcy, Dec. 20. Before Mr. Registrar Linklater.)—The bankrupt, a builder, carrying on business at Woodford, applied for an order of discharge. The receiving order was obtained in March last, and the statement of affairs showed liabilities £1,029 in the aggregate, with assets of nominal value. The bankrupt began business as a builder in 1879 with £100 capital, and in 1882 gave up business on his own account, and had since lived upon his earnings as a journeyman builder, and upon a legacy of £880 received under the will of his father. He attributed his failure to losses on building operations and by bad debts. The Official Receiver reported that the bankrupt had applied no portion of the money derived from his father's estate in payment of the debts which he then owed, and that he had brought on his bankruptcy by unjustifiable extravagance in living. The petitioning creditor and another creditor also opposed on the ground that the bankrupt had vexatiously defended actions sought for the recovery of debts due from him. Mr. Registrar Linklater said the charge of vexatious defence was established, and the bankrupt's conduct had been very reprehensible. He received from his father's estate enough to pay off the debts which he then owed, but he had not done so, and the case presented very bad features. The order of discharge must be suspended for two years.

The Sheffield Guardians last week appointed a professional gentleman as a valuer at a salary of £300 a year. His appointment seems likely to be a sinecure, for the overseers, with whom the valuations rest, are determined neither to recognise him nor the position which the guardians have created. Fortified by opinion of counsel, they will employ their assistant overseers when valuations have to be made.

Mr. Robert Coath, who for more than half a century has carried on business as a builder at Liskeard, died last week, aged 77 years. The funeral on Saturday was attended by the members of the local Freemasons' lodge, and a large number of townsmen.

A stained-glass window was unveiled on Christmas Day in the south aisle of Kentisbeare Church. The artist was Mr. C. F. Drake, of Exeter.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Clerks of Works' Association. Monthly meeting, Carpenters' Hall, 8 p.m.

TUESDAY. — Birmingham Architectural Association. "Optical Refinements in Architecture," by W. H. Bidlake, M.A.

WEDNESDAY.—Civil and Mechanical Engineers' Society. "Salmon Passes," by A. Fairlie Bruce. 7 p.m.

FRIDAY.—Architectural Association. "Brasses of the 14th and 15th Centuries," by A. Oliver. 7.30 p.m.

SATURDAY.—Association of Public Sanitary Inspectors. "Our Gipsy and Van Children," by Geo. Smith, of Coalville. 6 p.m.

Architectural Association.—"Brasses of the 14th and 15th Centuries." A. Oliver. 7.30 p.m. January 6.

Halford Church, Salop, was reopened on St. Thomas's Day, after partial rebuilding. The nave has been taken down and rebuilt with additional buttresses. The walling is executed in random courses, the masonry being done with Cosford stone. The old roof of the nave has been replaced by one of pitch pine, and of this material the choir stalls are also made. The passages of the nave are laid with tiles from the manufactory of Woollascroft, Staffordshire, and the chancel with encaustic tiles by Goodwin and Son, Lugwardine Works, Hereford. The floors under the pews and in the sacristy are of wood, block-paved, by Mr. Roger L. Lowe, Farnworth, near Bolton. The glazing of the windows was carried out by Mr. Done, of Shrewsbury, and the painting and varnishing by Mr. R. France, of Shrewsbury. Mr. J. Edwards was foreman of the works; Mr. Nicholson, of Hereford, was the architect; and Mr. J. Groves, of Shrewsbury, the builder.

The ceremony of cutting the first sod of the new St. Helens and Wigan Junction Railway, which is to directly connect the important manufacturing town of St. Helens with the Manchester, Sheffield, and Lincolnshire, Midland, Great Northern, and other railways, will take place during the last week in January. The Earl of Derby has promised to perform the ceremony. The site chosen is that on which the new central station will be erected between the St. Helens Town Hall and College-street, and as near as possible to Corporation-street.

CHIPS.

Receiving orders in bankruptcy have been issued in the cases of Peter Williamson Thomson, of Willington-quay, Northumberland, surveyor; and Alfred Tattershall, Arcadian-road, Chitt's Hill-park, Wood Green, trading at Calabria-road, Highbury, and Crescent-road, Alexandra Park Estate, Wood Green, builder.

The *City Press* states that the site of the northern approach to the Tower Bridge has been cleared since the death of Sir Horace Jones. The northern approach cannot be started yet for some time, but all freehold and leasehold claims on both sides of the river have been settled, most of them while Mr. Andrew Murray was the acting architect.

The local authority of Grantown, N.B., has adopted a scheme for water supply prepared by Mr. Roberts, C.E., of Kingussie.

Lady Elizabeth Villiers, who has contributed £1,250 to the Peterborough Cathedral Restoration Fund, has promised to defray the cost of a new choir screen for the same cathedral. The general restoration is meanwhile at a standstill for want of funds.

The first meeting was held at the London Bankruptcy Court on the 21st inst. of the creditors of James Whitaker, of Cromwell-gardens, West Kensington Park, builder, the total liabilities being returned at £54,114, of which £10,563 are expected to rank, and assets *nil*. The proceedings resulted in bankruptcy, and a trustee was appointed, the official receiver acting as a committee of inspection.

The operations necessary for the removal of the extensive establishment of Messrs. Sharp, Stewart, and Company from Manchester to Glasgow are completed, and next week the firm of Sharp, Stewart, and Company, of Glasgow, will be at work. The shareholders of the company and of the Clyde Locomotive Company, which will be merged in the new concern, have assented to the amalgamation and removal.

Messrs. Hoult and Wise, of Liverpool, have been instructed by the proprietor of Tranmere Ferry to prepare plans for reconstructing the high level pier at Tranmere, destroyed six weeks since.

Mr. John Hargrave Wraith, surveyor, of Darwen, has been placed on the commission of the peace for that borough.

An important link in the chain of railway communication between the northern and western suburbs of the metropolis will be supplied by the opening for passenger traffic of the new junction line between the Great Western and North and South-Western Junction Railways at Acton, which will come into use on Monday next. Commencing on that date, a service of trains will be run by the Great Western Company between Southall and Willesden Junction.

Mr. H. T. Munns has received from the Testimonial Committee a commission to paint a full-length portrait of Sir John Morris, to be hung, when completed, in the Town Hall, Wolverhampton.

The death is announced, in his fortieth year, of the well-known Italian sculptor, Signor Giovanni Baptista Amendola, best known in England by his statuettes of Mrs. Alma Tadema, Lady Milford, and Mrs. S. Lewis, and by a bas-relief of Orpheus.

On Tuesday week services were held at Uttoxeter Parish Church to celebrate its reopening. The unsightly box pews have all been removed from the body of the church and modern open seats substituted. As the old pews were of oak, the wood has been used in constructing the new seats, which harmonise well with the gallery, where the old pews remain. The church has been painted inside. A large 12-branch gas pendant lights the body of the church and smaller ones have been fixed under the gallery. The cost of the work is about £400, and Messrs. Thomas Cross and Sons were the builders.

A stained-glass window was unveiled on Friday in the Church of St. Michael, Malton, in commemoration of the restoration of the church. Messrs. Heaton, Butler, and Bayne, of London, were the artists.

The theatre at Shrewsbury was reopened on Boxing Day after internal reconstruction, decoration, and refurnishing, carried out by Mr. Oliver Jones, from plans by Mr. J. L. Randal, both of Shrewsbury.

Offers have just been accepted for the erection of a church from plans by Messrs. Chalmers and Robson, architects, Glasgow. The new building, which will be in the style of Early English Gothic, is to accommodate 320 sitters, and will cost about £700. The congregation have meantime secured the use of the hall of the Innerbrothock Free Church as a place of worship.

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.
